

Avaya Solution & Interoperability Test Lab

Configuring SIP Trunks among Avaya Aura® Session Manager R6.0 SP1, Avaya Aura® Communication Manager R6.0 SP2, and Cisco Unified Communications Manager Express R8.1 – Issue 1.0

Abstract

These Application Notes present a sample configuration for a network that uses Avaya Aura® Session Manager to connect Avaya Aura® Communication Manager and Cisco Unified Communications Manager Express using SIP trunks.

For the sample configuration, Avaya Aura® Session Manager runs on an Avaya S8800 Server, Avaya Aura® Communication Manager runs on an Avaya S8800 Server with Avaya G450 Media Gateway, and Cisco Unified Communications Manager Express runs on a Cisco 3825 Integrated Services Router (ISR). The results in these Application Notes should be applicable to other Avaya servers and media gateways that support Avaya Aura® Communication Manager.

1 Introduction

These Application Notes present a sample configuration for a network that uses Avaya Aura® Session Manager R6.0 Service Pack 1 to connect Avaya Aura® Communication Manager R6.0 Service Pack 2 and Cisco Unified Communications Manager Express (Cisco UCME) R8.1 using SIP trunks.

As shown in **Figure 1**, the Avaya 9630 IP Telephone (H.323), Avaya 9620C IP Telephone (SIP), and 2420 Digital Telephone are supported by Avaya Aura® Communication Manager and Avaya Aura® Session Manager. The Cisco 7965G IP Telephone (SIP) and the Cisco 7975G IP Telephone (SCCP) are supported by the Cisco UCME. SIP trunks are used to connect these two systems to Avaya Aura® Session Manager. All inter-system calls are carried over these SIP trunks. Avaya Aura® Session Manager can support flexible inter-system call routing based on dialed number, calling number and system location, and can also provide protocol adaptation to allow multi-vendor systems to interoperate. It is managed by a separate Avaya Aura® System Manager, which can manage multiple Avaya Aura® Session Managers by communicating with their management network interfaces. Avaya Modular Messaging expands the capabilities and features by providing centralized voicemail services to subscribers at the Cisco and Avaya sites. The Avaya Modular Messaging configuration is outside of the scope of these Application Notes.

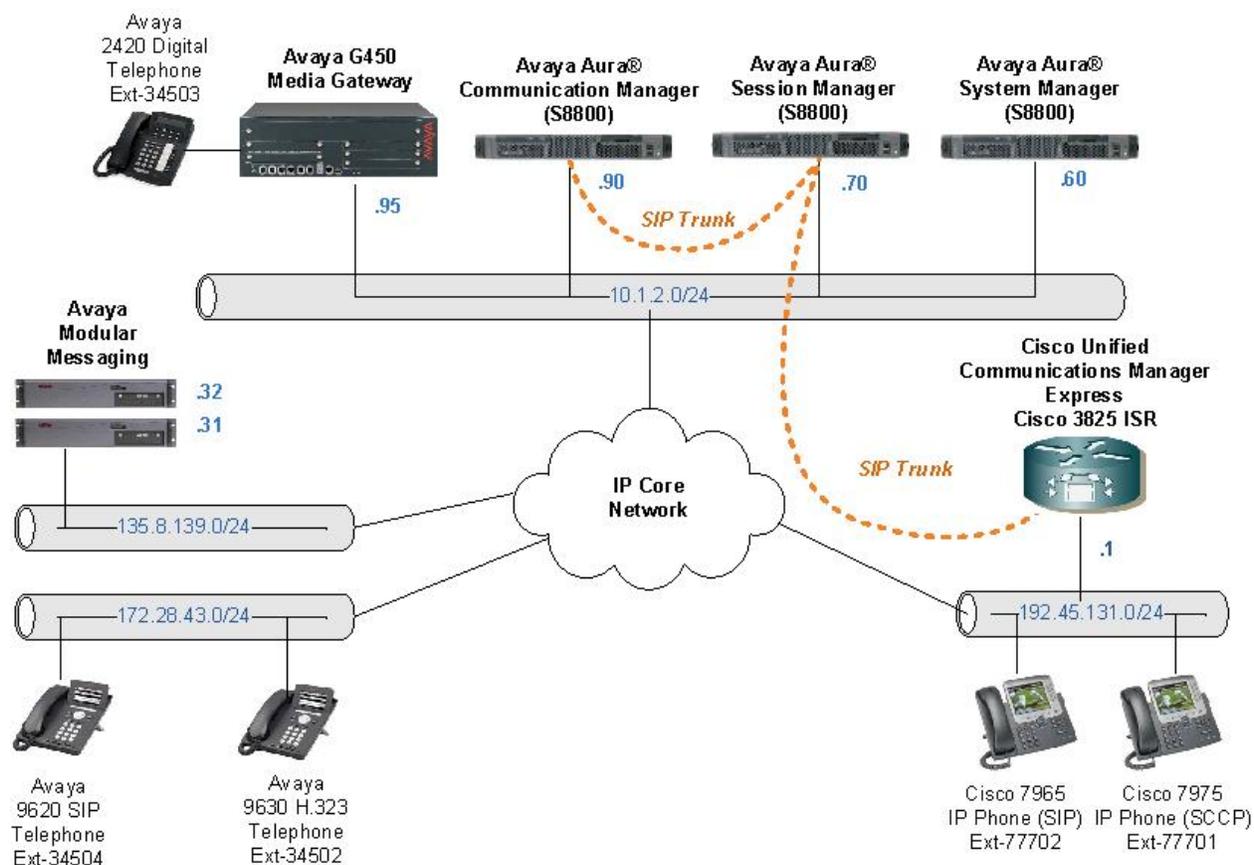

Figure 1 – Sample Configuration

For the sample configuration, Avaya Aura® Session Manager runs on an Avaya S8800 Server, Avaya Aura® Communication Manager runs on an Avaya S8800 Server with Avaya G450 Media Gateway, and Cisco Unified Communications Manager Express runs on Cisco 3825 Integrated Services Router (ISR). The results in these Application Notes should be applicable to other Avaya Aura® servers and Media Gateways.

A five digit Uniform Dial Plan (UDP) is used for dialing between systems. Unique extension ranges are associated with Avaya Aura® Communication Manager R6.0 (345xx) and Cisco UCME R8.1 (777xx).

These Application Notes will focus on the configuration of the SIP trunks and call routing. Detailed administration of the endpoint telephones will not be described (see the appropriate documentation listed in **Section 9**).

2 Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

DEVICE DESCRIPTION	VERSION TESTED
Avaya Aura® Communication Manager Running on an Avaya S8800 Server with an Avaya G450 Media Gateway	6.0 (R016x.00.0.345.0) with SP2 (00.0.345.0-18567) ¹
Avaya Aura® System Manager Running on an Avaya S8800 Server	6.0 SP1 (Build No. 6.0.0.0.668-3.0.7.0)
Avaya Aura® Session Manager Running on an Avaya S8800 Server	6.0 SP1 (6.0.1.0.601009)
Avaya 9630 IP Telephone (H.323)	3.101S
Avaya 9620 IP Telephone (SIP)	2.6.3
Avaya 2420 Digital Telephone	-
Avaya Modular Messaging Messaging Application Server (MAS) Messaging Storage Server (MSS)	5.2, SP5 (Patch 1)
Cisco Unified Communications Manager Express Running on a Cisco 3825 ISR	8.1 IOS 15.1(2)T1 (ED)
Cisco 7965G Unified IP Phone (SIP)	SIP45.8-5-4S
Cisco 7975G Unified IP Phone (SCCP)	SCCP75.8-5-4S

¹ Testing start with CM R6.0 SP1 (00.0.345.0-18444) and finished with CM R6.0 SP2 (00.0.345.0-18567).

3 Configure Avaya Aura® Communication Manager

This section illustrates relevant configuration for Communication Manager SIP Trunking to Session Manager. The configuration in this section uses the System Access Terminal (SAT) interface, and screens may be abridged for brevity in presentation. For further information on Communication Manager, please consult references [4] and [5]. The configuration procedures include the following areas:

- Verify Communication Manager License
- Administer System Parameters Features
- Administer IP Node Names
- Administer IP Network Regions
- Administer IP Codec Sets
- Administer SIP trunk Group and Signaling Group
- Administer Private Numbering
- Administer Uniform Dial Plan
- Administer AAR Analysis
- Administer Route Patterns
- Save Transactions

3.1 Verify Avaya Aura® Communication Manager License

Log into the System Access Terminal (SAT) to verify that the Communication Manager license has proper permissions for features illustrated in these Application Notes. Use the “display system-parameters customer-options” command. Navigate to **Page 2**, and verify that there is sufficient remaining capacity for SIP trunks by comparing the **Maximum Administered SIP Trunks** field value with the corresponding value in the **USED** column. The difference between the two values needs to be greater than or equal to the desired number of simultaneous SIP trunk connections.

The license file installed on the system controls the maximum permitted. If there is insufficient capacity or a required feature is not enabled, contact an authorized Avaya sales representative to make the appropriate changes.

```
display system-parameters customer-options                               Page 2 of 11
                                OPTIONAL FEATURES

IP PORT CAPACITIES                                                    USED
      Maximum Administered H.323 Trunks: 12000 100
    Maximum Concurrently Registered IP Stations: 18000 3
      Maximum Administered Remote Office Trunks: 12000 0
Maximum Concurrently Registered Remote Office Stations: 18000 0
      Maximum Concurrently Registered IP eCons: 414 0
    Max Concur Registered Unauthenticated H.323 Stations: 100 0
      Maximum Video Capable Stations: 18000 0
    Maximum Video Capable IP Softphones: 18000 0
      Maximum Administered SIP Trunks: 24000 156
```

3.2 Configure System Parameters Features

Use the “change system-parameters features” command to allow for trunk-to-trunk transfers. This feature is needed to be able to transfer an incoming/outgoing call from/to the remote switch back out to the same or another switch. For simplicity, the **Trunk-to-Trunk Transfer** field was set to “all” to enable all trunk-to-trunk transfers on a system wide basis. Submit the change.

Note: This feature poses significant security risk, and must be used with caution. For alternatives, the trunk-to-trunk feature can be implemented using Class Of Restriction or Class Of Service levels. Refer to the appropriate documentation in **Section 9** for more details.

```
change system-parameters features                                     Page 1 of 19
                                FEATURE-RELATED SYSTEM PARAMETERS
      Self Station Display Enabled? n
      Trunk-to-Trunk Transfer: all
    Automatic Callback with Called Party Queuing? y
Automatic Callback - No Answer Timeout Interval (rings): 3
      Call Park Timeout Interval (minutes): 10
    Off-Premises Tone Detect Timeout Interval (seconds): 20
      AAR/ARS Dial Tone Required? y
```

3.3 IP Node Names

Node names are mappings of names to IP Addresses that can be used in various screens. The following abridged screen shows the relevant node-names used in the sample configuration. **Name** "SM1" and **IP Address** "10.1.2.70" are entered for Session Manager. The IP Address of the S8800 processor Ethernet interface named "procr" is configured via the Web administration of the S8800 Server. Here, it can be observed that "procr" and "10.1.2.90" are the **Name** and **IP Address** for Communication Manager running on the Avaya S8800 Server. For other system types, where an Avaya C-LAN card is used as the SIP signaling interface, the node name and IP Address of the C-LAN card would be entered here.

```
change node-names ip                               Page 1 of 2
                                                    IP NODE NAMES

```

3.4 Network Regions

Network regions provide a means to logically group resources. Non-IP telephones (e.g., analog, digital) derive network region and location configuration from the Avaya gateway to which the device is connected. The following display command ("display media-gateway 1") shows that media gateway 1 is an Avaya G450 Media Gateway configured for **Network Region 1**.

```
display media-gateway 1                             Page 1 of 2
                                                    MEDIA GATEWAY 1

```

IP telephones can be assigned a network region based on an IP address mapping. The following screen illustrates a subset of the IP network map configuration. When the IP address of a registering IP telephone is in the ip-network-map, the phone is assigned the network region assigned by the form shown below. Strictly speaking, this ip-network-map configuration is not necessary, since the Avaya IP Telephones are assigned to the IP Network Region of the CLAN or PROCR interfaces they register to.

```

change ip-network-map                                     Page 1 of 63
                IP ADDRESS MAPPING
                Subnet Network      Emergency
                Bits   Region VLAN  Location Ext
-----
FROM: 172.28.43.0   /    1    n
TO:   172.28.43.255

```

The following screen shows IP Network Region 1 configuration. Connections within network region 1 use codec set 1 by virtue of the **Codec Set** configuration shown on **Page 1** below. For the **Authoritative Domain** field, enter the SIP domain configured for this enterprise. Optionally, a descriptive **Name** can be configured. To enable direct media connections for calls between the Avaya devices in network region 1, ensure that the **Intra-region IP-IP Direct Audio** is set to “yes”. To permit direct media connections to other regions (unless otherwise prohibited by the other region), set the **Inter-region IP-IP Direct Audio** field to “yes”.

```

change ip-network-region 1                                     Page 1 of 20
                                                           IP NETWORK REGION
  Region: 1
Location:      Authoritative Domain: avaya.com
  Name: Avaya devices

```

The following screen shows the inter-network region connection configuration for region 1. The bold row shows that network region 1 is directly connected to network region 3, and that codec set 3 will be used for connections between region 1 and region 3. Later, when the SIP signaling group is defined, the “far-end region” will be set to network region 3. Having different network regions for the local Avaya devices and the far-end of a SIP trunk allows different codec parameters for intra-region connections (e.g., using codec set 1 for Avaya connections) and inter-region connections (e.g., using codec set 3 for Avaya-Cisco connections in the sample configuration). Once submitted, the configuration becomes symmetric, meaning that network region 3, **Page 3** will also show codec set 3 for region 3 – region 1 connectivity.

```

change ip-network-region 1                                     Page 4 of 20

```

3.5 IP Codec Sets

The following screens show the configuration for codec sets 1 and 3. In general, an IP codec set is a list of allowable codecs in priority order. In the sample configuration, all connections among the Avaya devices use codec set 1, preferentially using “G.711MU” with “SRTP” encryption, as shown below.

```
change ip-codec-set 1                                     Page 1 of 2
                                     IP Codec Set
Codec Set: 1

Audio      Silence      Frames      Packet
Codec      Suppression  Per Pkt     Size(ms)
1: G.711MU      n            2           20
2: G.729A   n            2           20
3:
4:
5:
6:
7:

Media Encryption
1: 1-srtp-aescm128-hmac80
2: aes
3: none
```

In the sample configuration, all connections between the Avaya devices and the Cisco devices will use codec set 3, specified for inter-region connections between region 1 and region 3. During the testing, the codec parameters for codec set 3 were varied, with successful calls using “G.711MU”, and variants of G.729, each with no encryption (e.g. “G.729”, “G.729AB”).

```
change ip-codec-set 3                                     Page 1 of 2
                                     IP Codec Set
Codec Set: 3

3:
```

3.6 Configure SIP Signaling Group and Trunk Group

3.6.1 SIP Signaling Group

This section illustrates the configuration of the SIP Signaling Group to Session Manager. The signaling group has a **Group Type** of “sip”, and a **Near-end Node Name** of “procr”, the S8880 Server. For the Communication Manager Evolution Server configuration, **IMS Enabled** should be set to “n” and **Peer Detection Enabled** to “y”. The **Peer Server** field will be automatically populated as a result of the enabled peer detection. The **Far-end Node Name** is the node name “SM1” for Session Manager. The **Transport Method** is “tls”, and the **Near-End Listen Port** and **Far-End Listen Port** use port “5065”. Since an adaptation module will be defined in Session Manager to set the domain for all incoming calls to “avaya.com”, this value can be put in the **Far-end Domain**, and all outgoing and incoming calls to/from Session Manager will use this single trunk. This eliminates the need for a separate trunk for incoming calls from Cisco UCME which use the IP address of Session Manager instead of the SIP domain. The **Far-end Network Region** has been configured to be “3”, to allow different behaviors, such as codec selection, for intra-region and inter-region calls. Although not required, the **Enable Layer 3 Test** parameter is enabled to allow Communication Manager to maintain the signaling group using the SIP OPTIONS method. Other fields can be left at default values, including **DTMF over IP** set to “rtp-payload” which corresponds to RFC 2833.

```
add signaling-group 26                                     Page 1 of 1

```

This section illustrates the configuration of the SIP Trunk Group 26 to Session Manager. The trunk group has a **Group Type** of “sip” and a **Service Type** of “tie”. An appropriate Trunk Access Code (**TAC**) and **Group Name** are configured. Trunk group 26 is associated with **Signaling Group “26”**, and the **Number of Members** field is “10”, indicating that this trunk group can support ten simultaneous calls.

```

add trunk-group 26                                     Page 1 of 21

  Always Use re-INVITE for Display Updates? n
  Enable Q-SIP? n
```

3.7 Private Numbering

The “change private-numbering” command may be used to define the format of numbers such as the “calling party number” to be sent to Cisco UCME. In the bolded row shown in the abridged output below, all calls originating from a 5-digit extension beginning with 345 (i.e., 345xx) will not have any number prefixed, but rather a 5 digit calling party number will be sent in the SIP “From” and “P-Asserted-Identity” headers. In the sample configuration, this allows the Avaya user’s five digit telephone extension to appear on the display of the Cisco telephones. In a production environment, other rows in this table may be used to ensure that an appropriate calling party number is sent for calls routed via trunks to the PSTN.

```

change private-numbering 0                                     Page 1 of 2
                                NUMBERING - PRIVATE FORMAT
Ext Ext          Trk      Private      Total
Len Code        Grp(s)   Prefix      Len
5  345        26                   5   Total Administered: 1
                                           Maximum Entries: 540
  
```

3.8 Uniform Dial Plan

The Uniform Dial Plan (UDP) is configured such that calls matching the 777xx extension range of Cisco telephones are part of the overall UDP configuration. The following screen shows a sample UDP configuration using the “change uniform-dialplan 7” command. When a user dials a 5 digit extension beginning with 777 (i.e., 777xx), the call will use Automated Alternate Routing (AAR) for further analysis. Although not shown, please note that 777 needs to be added to the Dial Plan Analysis table prior to configuring this form.

```

change uniform-dialplan 7                                     Page 1 of 2
                                UNIFORM DIAL PLAN TABLE
                                           Percent Full: 0
Matching          Insert          Node
Pattern          Digits      Net Conv Num
777            5 0         aar n
  
```

3.9 AAR Analysis

The AAR Analysis table is configured such that calls matching the 777xx extension range of Cisco telephones are routed to **Route Pattern “26”**, as shown below.

```
change aar analysis 777
```

AAR DIGIT ANALYSIS TABLE							Page	1 of	2
Location: all							Percent Full: 2		
Dialed String	Total Min	Total Max	Route Pattern	Call Type	Node Num	ANI Reqd			
777	5	5	26	unku		n			

3.10 Route Pattern

Route pattern 26 is configured to include trunk group 26, the SIP trunk group to Session Manager, as shown below. Configure this route pattern to route calls to trunk group number “26” configured in **Section 3.6.2**. Assign the lowest **FRL** (facility restriction level) to allow all callers to use this route pattern. For **LAR** in row number (1) corresponding to the first trunk group entry, enter “next”. This will ensure that for calls (SIP INVITEs) for which Communication Manager receives no response, the shorter **Alternate Route Timer** will be used instead of the much longer **Session Establishment Timer**, minimizing the time before the caller hears reorder tone. See **Section 3.6.1** for these parameters.

```
change route-pattern 26
```

Pattern Number: 26													Pattern Name: To ASM		Page	1 of	3
SCCAN? n													Secure SIP? n				
Grp No	FRL	NPA	Pfx	Hop	Toll	No.	Inserted	DCS/	IXC								
								QSIG

3.11 Save Translations

Configuration of Communication Manager is complete. Use the “save Translations” command to save these changes.

4 Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. For further info on Session Manager, see [1-3]. The configuration procedures include the following areas:

- SIP Domains – the domains for which Session Manager is authoritative for routing SIP calls
- Locations – the logical or physical location of a SIP entity, which can be used for location-based routing or bandwidth management and call admission control
- Adaptations – SIP protocol adaptations (e.g., SIP header manipulations) can be used to improve and simplify interoperability with other SIP entities. Digit conversion adaptations can be used to modify digit strings on ingress/egress to Session Manager to normalize and simplify configuration of a common dial plan among systems that may have disparate dial plans
- SIP Entities – SIP entities correspond to the SIP telephony systems and Session Manager instances.
- Entity Links - define the SIP trunk parameters used by Session Manager when routing calls to/from SIP Entities
- Time Ranges - allow time-based criteria for call routing
- Routing Policies - configurable call routing between the SIP Entities
- Dial Patterns – configurable criteria for call routing (e.g., called party number pattern matching) and routing policies to be used when criteria are met
- Configure Session Manager
- Add Communication Manager as an Evolution Server
- Add Users for SIP Telephones

Configuration is accomplished by accessing the browser-based GUI of System Manager, using the URL “<http://<ip-address>/SMGR>”, where “<ip-address>” is the IP address of System Manager. Log in with the appropriate credentials and accept the Copyright Notice.

The menu shown below is displayed. Expand the **Routing** Link on the left side as shown. The sub-menus displayed in the left column below will be used to configure all but the last three items mentioned earlier (**Sections 4.1** through **4.8**).

Introduction to Network Routing Policy

Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.

The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:

Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).

Step 2: Create "Locations"

Step 3: Create "Adaptations"

Step 4: Create "SIP Entities"

- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)
- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"

Step 5: Create the "Entity Links"

- Between Session Managers

4.1 Configure the SIP Domain

To add the SIP domain for which the communications infrastructure will be authoritative, select **Routing** → **Domains** on the left as shown below.

* Input Required

4.2 Configure Locations

Locations can be used to identify logical or physical locations where SIP entities reside. If desired, the location of the originator of a call can be used as a routing criterion or for bandwidth management purposes. The screens associated with locations are illustrated below, although routing decisions in the sample configuration are not determined by the location, and bandwidth management techniques are not illustrated.

To configure locations, select **Routing** → **Locations**, as shown below. To add a new location, click **New**, or select a location from the list of existing locations.

The screenshot shows the Avaya Aura™ System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name, and user information: "Welcome, admin Last Logged on at August 20, 2010 1:48 PM". There are links for "Help", "About", "Change Password", and "Log off". Below the navigation bar is a red breadcrumb trail: "Home / Routing / Locations".

On the left is a sidebar menu with the following items: Elements, Events, Groups & Roles, Licenses, Routing (expanded), Domains, Locations (circled in red), and Adaptations.

The main content area is titled "Location" and contains the following elements:

- Buttons: Edit, **New** (highlighted with a red box), Duplicate, Delete, More Actions (dropdown), and Commit.
- Message: "A new entry will be opened in the detail editor."
- Summary: "15 Items | Refresh" and "Filter: Enable".
- Table header with columns: , Name, and Notes.

The following screen shows the location whose **Name** is “BaskingRidge”. In the sample configuration, Communication Manager and Session Manager are configured for the “BaskingRidge” location. The **IP Address Pattern** “10.1.2.*” corresponds to IP Addresses used for Session Manager, and “172.28.43.*” corresponds to IP Addresses used for Communication Manager. Click **Commit** to save each Location definition.

The screenshot displays the Avaya Aura System Manager 6.0 interface. At the top left is the Avaya logo. The page title is "Avaya Aura™ System Manager 6.0". On the top right, it says "Welcome, admin Last Logged on at August 20, 2010 1:48 PM" and provides links for "Help | About | Change Password | Log off". A red navigation bar contains the breadcrumb "Home / Routing / Locations / Location Details".

The left sidebar shows a tree view of configuration elements, with "Locations" under "Routing" circled in red. The main content area is titled "Location Details" and includes "Commit" and "Cancel" buttons. Under the "General" section, the "Name" field is "BaskingRidge" (circled in red), and the "Notes" field contains "CM and SM". Below this, there are fields for "Managed Bandwidth" and "* Average Bandwidth per Call" (set to 80 Kbit/sec).

The "Location Pattern" section has "Add" and "Remove" buttons. It shows a table with 4 items, filtered as "Enable". The table has columns for "IP Address Pattern" and "Notes". The following table represents the data shown in the screenshot:

<input type="checkbox"/>	IP Address Pattern	Notes
<input type="checkbox"/>	* 10.32.1.*	
<input type="checkbox"/>	* 10.32.2.*	
<input type="checkbox"/>	* 172.28.43.*	
<input type="checkbox"/>	* 10.1.2.*	

The last two rows of the table (172.28.43.* and 10.1.2.*) are highlighted with a red border.

The following screen shows the location whose **Name** is “Toronto”. In the sample configuration, Cisco UCME is configured for the “Toronto” location. As shown in **Figure 1**, the **IP Address Pattern** “192.45.131.*” corresponds to the IP Addresses used for Cisco UCME and the associated Cisco IP Telephones.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and user information: 'Welcome, admin Last Logged on at August 20, 2010 1:48 PM'. There are links for 'Help | About | Change Password | Log off'. Below this is a breadcrumb trail: 'Home / Routing / Locations / Location Details'. On the left is a sidebar menu with categories: Elements, Events, Groups & Roles, Licenses, Routing (expanded), Domains, Locations (circled in red), Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, Defaults, and Security. The main content area is titled 'Location Details' and contains a 'Commit' button (highlighted with a red box) and a 'Cancel' button. Under the 'General' section, the 'Name' field is set to 'Toronto' (highlighted with a red box) and the 'Notes' field contains 'Cisco UCME'. There are also fields for 'Managed Bandwidth' and '* Average Bandwidth per Call' (set to 80 Kbit/sec). The 'Location Pattern' section has 'Add' and 'Remove' buttons. Below is a table with one item, '192.45.131.*', with a checkbox and 'Notes' field containing 'Cisco UCME'. The table header is 'IP Address Pattern' and 'Notes'. The table row is highlighted with a red box.

4.3 Configure Adaptations

Two Adaptations need to be created: One for calls from/to Communication Manager called “DigitConversionAdapter” and the other for calls from/to Cisco UCME called “CiscoAdapter”.

The “DigitConversionAdapter” will adapt SIP request and SIP response messages. It uses the following pieces of information to perform digit adaptation on various SIP headers:

- Adaptation direction (incoming/ingress or outgoing/egress)
- Matching digit pattern and corresponding digits to remove/insert
- Domain name change for source components and destination components

The “CiscoAdapter” provides two basic header manipulations: converting between Diversion and History-Info headers and converting between P-Asserted-Id and Remote-Party-Id headers. The Diversion and Remote-Party-Id headers have not been accepted by the IETF. They are replaced by History-Info and P-Asserted-Identity respectively, but are still used in the Cisco products. The Cisco Adapter will also perform all the conversions available by the “DigitConversionAdapter”.

For the Communication Manager adaptation, enter the following information.

Adaptation name An informative name for the adaptation (e.g., “Avaya-R6.0”)
Module name Select **DigitConversionAdapter**.
Module parameter The parameter “odstd=avaya.com” specifies that the domain in the SIP Request-URI and NOTIFY/message-summary body of messages sent by Session Manager to that SIP Entity will be overridden with “avaya.com”. The parameter “osrcd=avaya.com” specifies that the domain in the P-Asserted-Identity header and the calling part of the History-Info header of messages sent by Session Manager will be overridden with “avaya.com”.

Since no digit conversions are required, the remaining fields can be left at their defaults.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and user information: "Welcome, admin Last Logged on at August 20, 2010 1:48 PM" with links for "Help | About | Change Password | Log off". The breadcrumb trail is "Home / Routing / Adaptations / Adaptation Details".

The left sidebar contains a navigation menu with categories: Elements, Events, Groups & Roles, Licenses, Routing (expanded), Security, System Manager Data, and Users. Under "Routing", the following items are listed: Domains, Locations, Adaptations (highlighted with a red circle), SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults.

The main content area is titled "Adaptation Details" and includes "Commit" and "Cancel" buttons. The "General" section contains the following fields:

- * Adaptation name:** Avaya-R6.0
- Module name:** DigitConversionAdapter (dropdown menu)
- Module parameter:** odstd=avaya.com osrcd=avaya.com
- Egress URI Parameters:** (empty text box)
- Notes:** (empty text box)

Below the "General" section are two sections for digit conversion:

- Digit Conversion for Incoming Calls to SM:** Includes "Add" and "Remove" buttons, a table with 0 items, and a "Filter: Enable" option. The table header includes columns for Matching Pattern, Min, Max, Delete Digits, Insert Digits, Address to modify, and Notes.
- Digit Conversion for Outgoing Calls from SM:** Includes "Add" and "Remove" buttons, a table with 0 items, and a "Filter: Enable" option. The table header includes columns for Matching Pattern, Min, Max, Delete Digits, Insert Digits, Address to modify, and Notes.

At the bottom left, there is a "Help" section with links for "Help for Adaptation Details fields" and "Help for Committing".

For the Cisco UCME adaptation, enter the following information.

Adaptation name "CiscoUCME", an informative name for the adaptation
Module name Select **CiscoAdapter**.
Module parameter Enter "iosrcd=avaya.com" to specify the Session Manager source SIP domain. Enter "odstd=192.45.131.1" where "192.45.131.1" is the IP address for Cisco UCME.

Since no digit conversions are required, the remaining fields can be left at their defaults.

Digit Conversion for Outgoing Calls from SM

4.4 Configure SIP Entities

A SIP Entity must be added for Session Manager and for each SIP-based telephony system supported by it using SIP trunks. In the sample configuration a SIP Entity is added for Session Manager and Cisco UCME. To add a SIP Entity, select **SIP Entities** on the left and click on the **New** button on the right. The screen is displayed as shown on the next page. Fill in the following:

Under *General*:

- **Name:** A descriptive name.
- **FQDN or IP Address:** IP address of the Session Manager or the signaling interface on the telephony system.
- **Type:** “Session Manager” for Session Manager, “CM” for Communication Manager, and “Other” for Cisco UCME.
- **Adaptation:** Select appropriate adaptation (Note: Not needed for SM1).
- **Location:** Select one of the locations defined in **Section 4.2**.
- **Time Zone:** Time zone for this location.

The following screen shows addition of Session Manager.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and user information: 'Welcome, admin. Last Logged on at August 21, 2010 12:59 AM'. There are links for 'Help | About | Change Password | Log off'. The breadcrumb trail is 'Home / Routing / SIP Entities / SIP Entity Details'. The left sidebar shows a tree view with 'SIP Entities' highlighted. The main content area is titled 'SIP Entity Details' and has 'Commit' and 'Cancel' buttons. The 'General' tab is active, showing fields for Name (SM1), FQDN or IP Address (10.1.2.70), Type (Session Manager), Location (BaskingRidge), and Time Zone (America/New_York). There is also a field for Outbound Proxy and a Credential name field. Below this is the 'SIP Link Monitoring' section with a dropdown set to 'Use Session Manager Configuratio'. At the bottom, there is an 'Entity Links' section with a warning: 'Entity Links can be modified after SIP Entity is committed.' and a 'Port' section with 'Add' and 'Remove' buttons.

Under *Port* for the Session Manager Entity, click **Add**, and then edit the fields in the resulting new row as shown below:

- **Port:** Port number on which the system listens for SIP requests.
- **Protocol:** Transport protocol to be used to send SIP requests.
- **Default Domain** The domain used for the enterprise (e.g., “avaya.com”).

4 Items Refresh					Filter: Enable
<input type="checkbox"/>	Port ▲	Protocol	Default Domain	Notes	
<input type="checkbox"/>	5060	TCP ▼	avaya.com ▼		
<input type="checkbox"/>	5060	UDP ▼	avaya.com ▼		
<input type="checkbox"/>	5061	TLS ▼	avaya.com ▼		
<input type="checkbox"/>	5065	TLS ▼	avaya.com ▼		

Defaults can be used for the remaining fields. Click **Commit** to save each SIP Entity definition.

The following screen shows addition of Communication Manager. The IP address used is that of the Avaya S8800 server.

The screenshot displays the Avaya Aura System Manager 6.0 web interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and a user status message: "Welcome, admin Last Logged on at August 21, 2010 12:59 AM". A secondary navigation bar contains links for "Help | About | Change Password | Log off".

The main content area is titled "SIP Entity Details" and features a left-hand navigation menu with categories like "Elements", "Events", "Groups & Roles", "Licenses", "Routing", "Domains", "Locations", "Adaptations", "SIP Entities" (highlighted with a red circle), "Entity Links", "Time Ranges", "Routing Policies", "Dial Patterns", "Regular Expressions", "Defaults", "Security", "System Manager Data", and "Users".

The "SIP Entity Details" form is divided into sections: "General", "Override Port & Transport with DNS SRV", and "SIP Link Monitoring". The "General" section is highlighted with a red box and contains the following fields:

- Name:** CM-Evolution-procr-5065
- FQDN or IP Address:** 10.1.2.90
- Type:** CM
- Notes:** CM-ES procr IP, different port
- Adaptation:** Avaya-R6.0
- Location:** BaskingRidge
- Time Zone:** America/New_York

Below the "General" section, there is an "Override Port & Transport with DNS SRV" checkbox (unchecked) and a "SIP Timer B/F (in seconds)" field set to 4. A "Credential name" field is present but empty. The "Call Detail Recording" dropdown is set to "none".

The "SIP Link Monitoring" section includes a "SIP Link Monitoring" dropdown set to "Use Session Manager Configuratio".

At the top right of the form area, there are "Commit" and "Cancel" buttons.

The following screen shows addition of Cisco UCME. The IP address used is that of the Cisco UCME ethernet interface.

SIP Link Monitoring:

4.5 Configure Entity Links

A SIP trunk between Session Manager and a telephony system is described by an Entity link. To add an Entity Link, select **Entity Links** on the left and click on the **New** button on the right. Fill in the following fields in the new row that is displayed:

- **Name:** A descriptive name.
- **SIP Entity 1:** Select the Session Manager.
- **Protocol:** Transport protocol for communication between entities.
- **Port:** Port number to which the other system sends SIP requests
- **SIP Entity 2:** Select the name of the other system.
- **Port:** Port number on which the other system receives SIP requests
- **Trusted:** Check this box. *Note: If this box is not checked, calls from the associated SIP Entity specified in **Section 4.4** will be denied.*

Click **Commit** to save each Entity Link definition. The following screen shows the result of adding the two Entity Links for Communication Manager and Cisco UCME.

Note: A third entity link between Cisco UCME and Session Manager was added using UDP port 5060. This entity link was needed because under certain call scenarios, Cisco UCME sent SIP traffic to Session Manager using UDP transport even though the Cisco UCME dial-peer configuration was set to use TCP transport.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and user information: "Welcome, admin Last Logged on at August 21, 2010 12:59 AM". There are links for "Help | About | Change Password | Log off". The breadcrumb trail is "Home / Routing / Entity Links". On the left, a sidebar menu shows "Entity Links" selected. The main content area is titled "Entity Links" and contains buttons for "Edit", "New", "Duplicate", "Delete", "More Actions", and "Commit". Below the buttons, it says "31 Items Refresh" and "Filter: Enable". A table lists the configured entity links:

<input type="checkbox"/>	Name	SIP Entity 1	Protocol	Port	SIP Entity 2	Port	Trusted	Notes
<input type="checkbox"/>	CiscoUCME-Link	SM1	TCP	5060	CiscoUCME	5060	<input checked="" type="checkbox"/>	
<input type="checkbox"/>	SM1_CM-Evolution-procr-5065	SM1	TLS	5065	CM-Evolution-procr-5065	5065	<input checked="" type="checkbox"/>	

4.6 Configure Time Ranges

Before adding routing policies (see **Section 4.7**), time ranges must be defined during which the policies will be active. In the sample configuration, one policy was defined that would allow routing to occur at anytime. To add this time range, select **Time Ranges** on the left and click on the **New** button on the right. Fill in the following:

- **Name:** A descriptive name (e.g., “Anytime”).
- **Mo through Su** Check the box under each of these headings
- **Start Time** Enter “00:00”.
- **End Time** Enter “23:59”

Click **Commit** to save this time range.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the system name, and user information. The left sidebar contains a menu with 'Time Ranges' highlighted. The main content area displays the 'Time Ranges' configuration page with a table of existing time ranges. A red box highlights the 'Anytime' entry in the table, and another red box highlights the 'Commit' button at the bottom right.

4.7 Configure Routing Policies

Routing policies describe the conditions under which calls will be routed to the SIP Entities specified in **Section 4.4**. Two routing policies must be added – one for Communication Manager and one for Cisco UCME. To add a routing policy, select **Routing Policies** on the left and click on the **New** button on the right. The screen shown on the next page is displayed. Fill in the following:

Under *General*:

- Enter a descriptive name in **Name**.

Under *SIP Entity as Destination*:

- Click **Select**, and then select the appropriate SIP entity to which this routing policy applies.

Under *Time of Day*:

- Click **Add**, and select the time range configured in **Section 4.6**.

Defaults can be used for the remaining fields. Click **Commit** to save each Routing Policy definition. The following screen shows the Routing Policy for Communication Manager.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and user information: "Welcome, admin Last Logged on at August 21, 2010 12:59 AM". A secondary navigation bar shows "Home / Routing / Routing Policies / Routing Policy Details".

On the left is a sidebar menu with categories: Elements, Events, Groups & Roles, Licenses, Routing (expanded), Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, **Routing Policies** (highlighted with a red circle), Dial Patterns, Regular Expressions, Defaults, Security, System Manager Data, and Users. A "Help" section at the bottom of the sidebar provides "Help for Routing Policy Details fields".

The main content area is titled "Routing Policy Details" and contains the following sections:

- General**: Includes a "Name" field with the value "TO CM6-ES port 5065" (highlighted with a red box), a "Disabled" checkbox (unchecked), and a "Notes" field with the value "345xx CM-6-ES range".
- SIP Entity as Destination**: Includes a "Select" button and a table listing destinations. The table has columns: Name, FQDN or IP Address, Type, and Notes. One entry is highlighted with a red box:

Name	FQDN or IP Address	Type	Notes
CM-Evolution-procr-5065	10.1.2.90	CM	CM-ES procr IP, different port
- Time of Day**: Includes "Add", "Remove", and "View Gaps/Overlaps" buttons. Below is a table with 1 item, a "Refresh" button, and a "Filter: Enable" option. The table has columns: Ranking, Name, Mon, Tue, Wed, Thu, Fri, Sat, Sun, Start Time, End Time, and Notes. One entry is highlighted with a red box:

Ranking	Name	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Start Time	End Time	Notes
0	24/7	☑	☑	☑	☑	☑	☑	☑	00:00	23:59	Time Range 24/7

At the bottom of the "Time of Day" section, there is a "Select : All, None" option.

The following screen shows the Routing Policy for Cisco UCME.

4.8 Configure Dial Patterns

Dial patterns must be defined that will direct calls to the appropriate SIP Entity. In the sample configuration, 5-digit extensions beginning with “345” reside on Communication Manager, and 5-digit extensions beginning with “777” reside on Cisco UCME. To add a dial pattern, select **Dial Patterns** on the left and click on the **New** button on the right. Fill in the following, as shown in the screen later in this section, which corresponds to the dial pattern for routing calls to Communication Manager:

Under *General*:

- **Pattern:** Dialed number or prefix.
- **Min** Minimum length of dialed number.
- **Max** Maximum length of dialed number.
- **SIP Domain** Select **-ALL-**
- **Notes** Comment on purpose of dial pattern.

Under *Originating Locations and Routing Policies*:

Click **Add**, and then select the appropriate location and routing policy from the list.

Default values can be used for the remaining fields. Click **Commit** to save this dial pattern. The following screen shows the dial pattern definitions for Communication Manager.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and user information: "Welcome, admin Last Logged on at August 21, 2010 12:59 AM". A secondary navigation bar contains links for "Help | About | Change Password | Log off". The main content area is titled "Dial Pattern Details" and features a left-hand navigation menu with categories like Elements, Events, Groups & Roles, Licenses, Routing (expanded), Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns (highlighted with a red circle), Regular Expressions, Defaults, Security, System Manager Data, and Users. The "Dial Pattern Details" form is divided into two sections: "General" and "Originating Locations and Routing Policies". The "General" section contains fields for "Pattern" (345), "Min" (5), "Max" (5), "Emergency Call" (checkbox), "SIP Domain" (-ALL-), and "Notes" (345xx extension range). The "Originating Locations and Routing Policies" section includes "Add" and "Remove" buttons and a table with one item. The table has columns for "Originating Location Name", "Originating Location Notes", "Routing Policy Name", "Rank", "Routing Policy Disabled", "Routing Policy Destination", and "Routing Policy Notes". The single entry in the table is highlighted with a red box and shows "-ALL-" for the location name, "Any Locations" for notes, "IQ CM6-ES port 5065" for the routing policy name, a rank of 0, and "CM-Evolution-procr-5065" for the destination.

4.9 Configure Avaya Aura® Session Manager

To complete the configuration, adding the Session Manager will provide the linkage between System Manager and Session Manager. Navigate to **Elements** → **Session Manager** → **Session Manager Administration** in the panel menu on the left. Then on the right, under **Session Manager Instances**, click **New** (not shown) and fill in the fields as described below:

Under **General**:

- **SIP Entity Name** Select the name of the SIP Entity added for Session Manager, here **SM1**
- **Description** Descriptive comment (optional)
- **Management Access Point Host Name/IP** Enter the IP address of the Session Manager management interface

Under **Security Module**:

- **Network Mask** Enter the network mask corresponding to the IP address of Session Manager
- **Default Gateway:** Enter the IP address of the default gateway for Session Manager
- **SIP Entity IP Address** Will be automatically filled in based on the selected **SIP Entity Name**.

Use default values for the remaining fields. Click **Commit** to add this Session Manager. The following screen shows the resulting Session Manager.

The screenshot displays the Avaya Aura System Manager 6.0 web interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and a user status message: 'Welcome, admin Last Logged on at June 21, 2010 2:17 PM'. Below the navigation bar is a breadcrumb trail: 'Home / Elements / Session Manager / Session Manager Administration / View Session Manager'. On the left, a sidebar menu shows the 'Session Manager Administration' path selected. The main content area is titled 'View Session Manager' and contains configuration details for a Session Manager instance. The 'General' tab is active, showing fields for 'SIP Entity Name' (SM1), 'Description' (SM1), 'Management Access Point Host Name/IP' (10.1.2.71), and 'Direct Routing to Endpoints' (Enabled). The 'Security Module' tab is also visible, showing fields for 'SIP Entity IP Address' (10.1.2.70), 'Network Mask' (255.255.255.0), 'Default Gateway' (10.1.2.1), 'Call Control PHB' (46), 'QOS Priority' (6), and 'Speed & Duplex' (Auto). A 'Return' button is located in the top right corner of the configuration area.

4.10 Add Avaya Aura® Communication Manager as an Evolution Server

In order for Communication Manager to provide configuration and Evolution Server support to telephones, Communication Manager must be added as an application in Session Manager. This comprises a two step procedure. First, an access login must be configured on Communication Manager for the purpose of data synchronization with System Manager. Then the Application Element for that Communication Manager can be added via System Manager.

4.10.1 Create a Login on the Avaya Aura®Communication Manager Server

Use a web browser to access the Communication Manager maintenance web interface, and navigate to **Security** → **Administrator Accounts** on the left menu. Select **Add Login** and **Privileged Administrator**, as shown below. Click on **Submit**.

The screenshot displays the Avaya Aura Communication Manager maintenance web interface. The top navigation bar includes 'Help', 'Log Off', 'Administration', and 'Upgrade'. The main content area is titled 'Administrator Accounts' and contains a description: 'The Administrator Accounts web pages allow you to add, delete, and modify administrator accounts.' Below this, there is a 'Select Action:' section with several radio button options: 'Add Login' (selected), 'Privileged Administrator', 'Unprivileged Administrator', 'SAT Access Only', 'Web Access Only', 'Modem Access Only', 'CDR Access Only', 'CM Messaging Access Only', 'Business Partner Login (dadmin)', 'Business Partner Craft Login', and 'Custom Login'. At the bottom of the form, there are three rows of radio buttons for 'Change Login', 'Remove Login', and 'Lock/Unlock Login', each followed by a 'Select Login' dropdown menu. There are also radio buttons for 'Add Group' and 'Remove Group', with a 'Select Group' dropdown menu. The 'Submit' and 'Help' buttons are located at the bottom right of the form. The left sidebar menu is expanded to show the 'Security' section, with 'Administrator Accounts' selected.

On the next screen, enter a **Login name** and a password in the **Enter password or key** and **Re-enter password or key** fields, and click **Submit**.

4.10.5 Synchronize Avaya Aura® Communication Manager Data

Select **Elements** → **Inventory** → **Synchronization** → **Communication System** on the left. Select the appropriate **Element Name**. Select **Initialize data for selected devices**. Then click on **Now**. This may take some time. Use the menus on the left under **System Manager Data** → **Scheduler** to determine when the task is complete.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the product name "Avaya Aura™ System Manager 6.0", and user information: "Welcome, admin Last Logged on at July 1, 2010 11:07 AM". There are links for "Help | About | Change Password | Log off".

The breadcrumb trail is: Home / Elements / Inventory / Synchronization / Communication System.

The left sidebar shows a tree view of "Elements". The "Synchronization" folder is expanded, and "Communication System" is selected.

The main content area is titled "Synchronize CM Data and Configure Options". It contains a sub-header "Synchronize CM Data/Launch Element Cut Through | Configuration Options | Expand All | Collapse All". Below this is a dropdown menu "Synchronize CM Data/Launch Element Cut Through".

A table displays the synchronization status for one item:

<input checked="" type="checkbox"/>	Element Name	FQDN/IP Address	Last Sync Time	Last Translation Time	Sync Type	Sync Status	Lo
<input checked="" type="checkbox"/>	R6-CM-ES	10.1.2.90	July 1, 2010 6:00:34 AM - 04:00	10:00 pm WED JUN 30, 2010	Incremental	Completed	

Below the table, there is a "Select : All, None" dropdown. Three radio buttons are visible:

- Initialize data for selected devices
- Incremental Sync data for selected devices
- Save Translations for selected devices

At the bottom, there are four buttons: "Now", "Schedule", "Cancel", and "Launch Element Cut Through".

4.11 Add Users for SIP Telephones

SIP telephone users must be added to Session Manager. Select **Users** → **Manage Users** on the left. Then click on **New** (not shown). Enter a **First Name** and **Last Name**.

5 Configure Cisco Unified Communications Manager Express

Cisco Unified Communications Manager Express (Cisco UCME) is a call-processing application in Cisco IOS software that enables Cisco routers to deliver key-system or hybrid Private Branch Exchange (PBX) functionality for enterprise branch offices or small businesses. It supports H.323 and SIP trunk operation to other IP PBX systems.

This section illustrates the relevant Cisco UCME configuration for SIP trunking to Communication Manager via Session Manager. A VoIP dial peer “trunk” is configured in the UCME to connect to the Session Manager for communication with Communication Manager.

With the Cisco IOS 15.1(2)T1 used in this configuration, Cisco 7965G SIP and 7975G SCCP telephones require the following firmware to work with the Cisco UCME.

Cisco 7965G SIP Telephone:

- SIP45.8-5-4S.loads
- term45.default.loads
- term65.default.loads
- apps45.8-5-4TH1-6.sbn
- cnu45.8-5-4TH1-6.sbn
- cvm45sip.8-5-4TH1-6.sbn
- dsp45.8-5-4TH1-6.sbn
- jar45sip.8-5-4TH1-6.sbn

Cisco 7975G SCCP Telephone:

- SCCP75.8-5-4S.loads
- term75.default.loads
- jar75sccp.8-5-4TH1-6.sbn
- cvm75sccp.8-5-4TH1-6.sbn
- apps75.8-5-4TH1-6.sbn
- cnu75.8-5-4TH1-6.sbn
- dsp75.8-5-4TH1-6.sbn

This section focuses on the VoIP related configuration (in bold) on the Cisco 3825 router.

```

³ Avaya Aura® Communication Manager supports SIP “302” messages; however due to interoperability issues observed during call forwards, this supplementary services was disabled on Cisco UCME.

⁴ The Cisco 7965 SIP Telephone does not support the G.729B codec (annexb=yes).

6 Verification Steps

This section provides the tests that can be performed on Communication Manager, Session Manager, and Cisco UCME to verify their proper configuration.

6.1 Verify Avaya Aura® Communication Manager

This section presents screens from Communication Manager that can be used to verify or troubleshoot the configuration.

6.1.1 SIP Signaling Group and Trunk Group Status

The SIP Signaling Group and SIP Trunk Group to Session Manager should be in-service. The following screen shows the “status trunk 26” screen, showing all trunks are in-service and idle.

```
status trunk 26
                TRUNK GROUP STATUS
Member   Port      Service State   Mtce Connected Ports
                Busy
0026/001 T00017   in-service/idle no
0026/002 T00018   in-service/idle no
0026/003 T00019   in-service/idle no
0026/004 T00020   in-service/idle no
0026/005 T00021   in-service/idle no
0026/006 T00022   in-service/idle no
0026/007 T00023   in-service/idle no
0026/008 T00024   in-service/idle no
0026/009 T00025   in-service/idle no
0026/010 T00026   in-service/idle no
```

If the trunk group is not in-service, check the SIP Signaling Group status. The following screen shows the “status signaling-group 26” screen, showing that the signaling group is in-service.

```
status signaling-group 26
                STATUS SIGNALING GROUP
                Group ID: 26                Active NCA-TSC Count: 0
                Group Type: sip              Active CA-TSC Count: 0
                Signaling Type: facility associated signaling
                Group State: in-service
```

If the signaling group is in a “bypass” state, check the **Enable Layer 3 Test** parameter on the signaling group screen. If the **Enable Layer 3 Test** for the signaling group is set to “n”, Communication Manager will use an “ICMP ping” test to verify that the far-end of the signaling group is reachable. Some networks may not pass ICMP ping, which is a possible cause for the signaling group to be marked for “bypass” and the corresponding trunk group to be marked “Out-of-Service/Far-end”. In this state, Communication Manager would not use the trunk for outbound calls, but would allow an incoming call. In the sample configuration, the **Enable Layer 3 Test** has been set to “y”, meaning that Communication Manager will use a SIP OPTIONS message to the far-end (Session Manager in this case) to verify connectivity. If the signaling group is marked for “bypass”, and the SIP OPTIONS method is used, verify that the far-end node name (and corresponding IP Address) correctly refers to Session Manager. Verify

that Session Manager is on-line and configured properly for a SIP Entity to Communication Manager. The Session Manager SIP Entity representing Communication Manager should specify the IP Address corresponding to the node name at the “near-end” of the Communication Manager signaling group (i.e., in this case, the S8800 “procr” IP Address).

Note: For greater detail, the traces shown below were captured with “Shuffling” enabled on the Communication Manager SIP signaling group to Session Manager.

6.1.2 Avaya Telephone Calls Cisco Telephone

This section has example calls where an Avaya H.323 telephone calls Cisco SIP and SCCP telephones. Greater detail is included in the initial illustrations, since the results including displays and connection topology are independent of the called telephone type in the sample configuration.

6.1.2.1 Avaya H.323 Telephone Calls Cisco SIP Telephone

The following “list trace station” output illustrates a call from the Avaya IP Telephone with extension 34502 to Cisco SIP Telephone extension 77702. The Avaya telephone, with IP Address 172.28.43.2 in network region 1, dials 77702. The call is routed using UDP and AAR to route pattern 26 containing trunk group 26. When the Cisco telephone is ringing, the Cisco telephone’s display will show “From Tom Avaya (34502)” which correspond to the name and extension of the Avaya calling telephone. Similarly, the Avaya telephone will display “Maria 77702”, which correspond to the Alerting Name and number configured for the called Cisco telephone. Upon answer by the called Cisco user, the displays are unchanged. The “far-end” region is region 3, and therefore the media connection is between region 1 and region 3. Codec set 3 governs this connectivity, and the final connection uses G.729, which was specified in ip-codec-set 3 at the time of this call. The initial media path connects the Cisco UCME with IP Address 192.45.131.1 in network region 3 to the Avaya G450 VoIP resources, at 10.1.2.95. After “shuffling” occurs, the final media path connects the Cisco UCME with IP Address 192.45.131.1 in network region 3 to the Avaya IP Telephone, at 172.28.43.2. With “Shuffling” or “Direct IP-IP Audio Connections” disabled on the Communication Manager SIP signaling group, the media path would stay between the Cisco UCME and the Avaya G450 VoIP resource.

```

The “status trunk” command can also be used, as shown below for this same call, while active. **Page 2** is shown below. The near-end and far-end signaling IP Addresses and Ports can be observed for the TLS connection between Communication Manager and Session Manager. The media connection information shows that the call is “ip-direct” between the Avaya IP Telephone and Cisco UCME. With “Shuffling” or “Direct IP-IP Audio Connections” disabled, the “Audio Connection Type” would display “ip-tdm”.

```

If the Cisco telephone holds the call, music on hold from Cisco UCME is heard by the Avaya telephone.

If the Avaya telephone holds the call, the media path must move from the Avaya IP telephone to the Avaya G450 announcement capability playing the music. The following is an example status screen taken when the Avaya phone had held the call, and the Cisco telephone user was listening to music from the Avaya G450 announcement capability.

```

If the Avaya IP telephone resumes the held call, the media path moves off Avaya G450 Media Gateway back to the Avaya IP telephone. That is, the connection topology returns to the status before the call was held.

If the Cisco SIP telephone transfers the call to the Cisco SCCP telephone, the transfer is successful, and the final connection topology has the Avaya IP Telephone communicating with Cisco UCME. Post transfer, the display on the transferred-to telephone is “From Tom Avaya (34502)”, the name and number of the Avaya telephone. The display on the Avaya telephone updates to “Tony 77701”, the name and number of the transferred-to Cisco SCCP telephone.

6.1.2.2 Avaya H.323 Telephone Calls Cisco SCCP Telephone

The following “list trace station” output illustrates a call from the Avaya IP Telephone with extension 34502 to Cisco SCCP Telephone extension 77701. The Avaya telephone, with IP Address 172.28.43.2 in network region 1, dials 77701. The call is routed using UDP and AAR to route pattern 26 containing trunk group 26. When the Cisco telephone is ringing, the Cisco telephone’s display will show “From Tom Avaya (34502)” which correspond to the name and extension of the Avaya calling telephone. Similarly, the Avaya telephone will display “Tony 77701”, which correspond to the Alerting Name and number configured for the called Cisco telephone. Upon answer by the called Cisco user, the displays are unchanged. The “far-end” region is region 3, and therefore the media connection is between region 1 and region 3. Codec set 3 governs this connectivity, and the final connection uses G.729, which was specified in ip-codec-set 3 at the time of this call. The initial media path connects the Cisco UCME with IP Address 192.45.131.1 in network region 3 to the Avaya G450 VoIP resources, at 10.1.2.95. After “shuffling” occurs, the final media path connects the Cisco UCME with IP Address

192.45.131.1 in network region 3 to the Avaya IP Telephone, at 172.28.43.2. As stated previously, with “Shuffling” disabled, the media path would stay between the Cisco UCME and the Avaya G450 VoIP resource.

The “status trunk” command can also be used, with similar output to that already presented in the prior section. Rather than repeat, more detailed information is provided for a Cisco held call. If the Cisco telephone holds the call, music on hold from Cisco UCME is heard by the Avaya telephone. The following screen illustrates the connection while on hold at the Cisco side.

```
status trunk 26/10                                     Page 3 of 3
SRC PORT TO DEST PORT TALKPATH

S00106:RX:172.28.43.2:63878/g729a/20ms
```

Once the call is resumed, two-way audio is restored properly.

If the Avaya IP telephone transfers the call to the Avaya digital telephone, the transfer is successful, and the final connection is between the Avaya G450 VoIP resource and Cisco UCME. Post transfer, the display on the transferred-to Avaya telephone will show “Tony 77701”, the name and number of the connected Cisco telephone. The display on the connected Cisco telephone updates to “From Digital Avaya (34511)”, the name and number of the transferred-to Avaya telephone.

If the Cisco SCCP telephone (77701) transfers the call to the Cisco SIP telephone (77702), the transfer is successful, and the final connection is between the Avaya G450 VoIP resource and Cisco UCME. Post transfer, the display on the Avaya telephone will show “Answered by 77702”. The display on the transferred-to Cisco SIP telephone will show “From 77701”, the name and number of the original Cisco SCCP telephone that completed the transfer instead of the name and number of the connected Avaya digital telephone.

6.1.3 Cisco Telephone Calls Avaya Telephone

This section has example calls where Cisco SIP and SCCP telephones call the Avaya IP telephone.

6.1.3.1 Cisco SIP Telephone calls Avaya H.323 Telephone

The following “list trace tac” output illustrates an incoming call from the SIP trunk to Session Manager for a call from Cisco SIP Telephone extension 77702 to Avaya IP Telephone extension 34502. When the Avaya telephone is ringing, the Cisco telephone’s display will show “To 34502” which correspond to the number of the called Avaya telephone. The name is not displayed because Cisco UCME upon receipt of a 180 RINGING message from Avaya sends a “183 Session Progress” message to the Cisco SIP Telephone with no Called Party Name in the “Remote-Party-ID” header (e.g. Remote-Party-ID: <sip:34502@192.45.131.1>;party=called;screen=no;privacy=off). The Avaya IP Telephone will display “Maria 77702”, which correspond to the name and number configured for the calling Cisco SIP Telephone. Upon answer by the called Avaya user, the Avaya telephone display is unchanged, however Cisco SIP phone display is updated correctly “To Tom Avaya (34502)”. (Do not be deceived by the trace output below showing no calling number and name. The number and name of the Cisco caller do appear on the Avaya telephone’s display).

Similar to the calls from Avaya to Cisco, the final media path is between Cisco UCME (192.45.131.1) and the Avaya IP Telephone (172.28.43.2). Again, please note that with “Shuffling” disabled, the media path would stay between the Cisco UCME and the Avaya G450 VoIP resource.

Hold/resume and transfer scenarios from both the Avaya telephone and Cisco telephone were verified and work properly as described previously. Screen details would be redundant and reveal no new information.

6.1.3.2 Cisco SCCP Telephone calls Avaya H.323 Telephone

The following “list trace tac” output illustrates an incoming call from the SIP trunk to Session Manager for a call from Cisco SCCP Telephone extension 77701 to Avaya IP Telephone extension 34502. When the Avaya telephone is ringing, the Cisco telephone’s display will show “To 34502” which correspond to the number of the called Avaya telephone. The Avaya IP telephone will display “Tony 77701”, which correspond to the Name and number configured for the calling Cisco telephone. Upon answer by the called Avaya user, the Avaya telephone display

is unchanged, however the Cisco SIP phone display is updated correctly “To Tom Avaya (34502)”.

Similar to the corresponding calls from Avaya to Cisco, the final media path is between Cisco UCME (192.45.131.1) and the Avaya IP Telephone (172.28.43.2). With “Shuffling” disabled, the media path would stay between the Cisco UCME and the Avaya G450 VoIP resource.

Hold/resume from both the Avaya telephone and Cisco telephone were verified and work properly as described previously. Screen details would be redundant and reveal no new information.

If the Cisco SCCP telephone (77701) transfers the call to the Cisco SIP telephone (77702), the transfer is successful, and the final connection is between the Avaya IP Telephone and Cisco UCME. Post transfer, the display on the transferred-to Cisco SIP telephone will incorrectly show “From Tony (34502)”, the name of the Cisco SCCP Telephone with the number of the connected Avaya IP telephone. The display on the connected Avaya telephone will show “Answered by 77702”.

If the Avaya IP telephone (34502) transfers the call to the Avaya digital telephone (34503), the transfer is successful, and the final connection is between the Avaya G450 VoIP resource and Cisco UCME. Post transfer, the display on the Avaya digital telephone will show “Answered by 77702”, the name and number of the connected Cisco telephone. The display on the connected Cisco SCCP telephone does not update and will show “From Tony (34502)”, the name of the Cisco SCCP Telephone with the number of the connected Avaya IP telephone.

6.2 Verify Avaya Aura® Session Manager

Session Manager includes SIP monitoring and routing test capabilities that can aid in verifying proper configuration and operation.

6.2.1 SIP Monitoring

Select **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring** as shown below.

The screenshot displays the Avaya Aura System Manager 6.0 web interface. The top navigation bar includes the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and user information: 'Welcome, admin Last Logged on at August 24, 2010 10:37 AM'. A red breadcrumb trail shows the path: Home / Elements / Session Manager / System Status / SIP Entity Monitoring. On the left, a sidebar menu lists various system components, with 'SIP Entity Monitoring' under 'System Status' circled in red. The main content area is titled 'SIP Entity Link Monitoring Status Summary' and includes a 'Refresh' button. Below this is a table showing monitoring statistics for instance 'SM1'. A second 'Refresh' button is present above a list of 26 monitored SIP entities, with 'CiscoUCME' highlighted in a red box.

AVAYA Avaya Aura™ System Manager 6.0 Welcome, **admin** Last Logged on at August 24, 2010 10:37 AM
Help | About | Change Password | Log off

Home / Elements / Session Manager / System Status / SIP Entity Monitoring

SIP Entity Link Monitoring Status Summary

This page provides a summary of Session Manager SIP entity link monitoring status.

Entity Link Status for All Session Manager Instances

Refresh

Session Manager Name	Entity Links Down/Total	Entity Links Partially Down	SIP Entities - Monitoring Not Started	SIP Entities - Not Monitored
SM1	12/29	1	0	3

All Monitored SIP Entities

Refresh

26 Items Filter: Enable

SIP Entity Name
ACE
AG2330
AllanC-S8300-G350
alpinemas1
AudioCodes M1000
AuraSBC
BR2 AudioCodes MP114
BR2 AudioCodes MP118
CallCenter
Cisco-UCM6
Cisco-UCM7
CiscoUCME

Select the name of the relevant SIP entity from the list of monitored SIP entities. The following screen shows a sample result when the “CiscoUCME” SIP Entity was selected. Observe that the connection is up. Cisco UCME is responding to the SIP OPTIONS message from Session Manager with a “200 OK”.

1 Item								Filter: Enable
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status	
Show	SM1	192.45.131.1	5060	TCP	Up	200 OK	Up	

Under the **Details** column, **Show** can be clicked to obtain further information, which may be particularly relevant if there is a problem. In this case, **Show** reveals the following:

1 Item								Filter: Enable
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status	
Hide	SM1	192.45.131.1	5060	TCP	Up	200 OK	Up	
Time Last Down	Time Last Up	Last Message Sent	Last Response Latency (ms)					
Aug 12, 2010 11:47:14 PM EDT	Aug 12, 2010 11:49:06 PM EDT	Aug 24, 2010 1:45:31 PM EDT	10					

Similarly, information about the status of the link between Session Manager and Communication Manager can be obtained by selecting **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring** and clicking on the link named “CM-Evolution-procr-5065”. As can be seen in the screen below, the connection is “Up”. Communication Manager is also responding with a “200 OK” to SIP OPTIONS sourced by Session Manager.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

All Entity Links to SIP Entity: CM-Evolution-procr-5065

Refresh

Summary View

1 Item								Filter: Enable
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status

6.2.2 Call Routing Test

To check that the configured Network Routing Policy will result in the expected routing between systems, select **Elements** → **Session Manager** → **System Tools** → **Call Routing Test**. The following screen is presented.

The screenshot displays the Avaya Aura™ System Manager 6.0 interface. At the top left is the AVAYA logo. The page title is "Avaya Aura™ System Manager 6.0". On the top right, it says "Welcome, admin Last Logged on at August 24, 2010 10:37 AM" and provides links for "Help | About | Change Password | Log off". A red navigation bar contains the path "Home / Elements / Session Manager / System Tools / Call Routing Test".

The main content area is titled "Call Routing Test" and includes a descriptive paragraph: "This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration." Below this is the "SIP INVITE Parameters" section with the following fields:

- Called Party URI**: Text input field.
- Calling Party URI**: Text input field.
- Day Of Week**: Dropdown menu set to "Tuesday".
- Time (UTC)**: Text input field set to "18:01".
- Called Session Manager Instance**: Dropdown menu set to "SM1".
- Calling Party Address**: Text input field.
- Session Manager Listen Port**: Text input field set to "5060".
- Transport Protocol**: Dropdown menu set to "TCP".
- Execute Test**: Button.

A left-hand navigation menu is visible, listing various system management options such as Conferencing, Presence, Application Management, Endpoints, SIP AS 8.1, Feature Management, Inventory, Templates, Session Manager (with sub-items like Dashboard, Administration, Editor, Network Configuration, Device and Location Configuration, Application Configuration, System Status), System Tools (with sub-items like Maintenance Tests, SIP Tracer, Configuration, SIP Trace Viewer, and Call Routing Test).

6.2.2.1 Cisco Telephone Calls Avaya Telephone

The following screen shows an example of a routing test for a Cisco telephone (77701) calling an Avaya telephone (34502). The self-explanatory **Called Party URI** and **Calling Party URI** fields are populated for a routing query.

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

SIP INVITE Parameters

Called Party URI 34502@avaya.com	Calling Party Address
Calling Party URI 77701@192.45.131.1	Session Manager Listen Port 5060
Day Of Week Tuesday	Time (UTC) 21:13
Called Session Manager Instance SM1	Transport Protocol TCP
<input type="button" value="Execute Test"/>	

After typing in the **Calling Party Address** with the IP Address of Cisco UCME, the **Execute Test** button is pressed. The following screen illustrates the summary result, under the heading **Routing Decisions**. If the caller is extension 77701, and the call comes from Cisco UCME using TCP port 5060, and arrives Tuesday at 18:01 (or “Anytime” in the sample configuration), and the called party is 34502, the call will be routed to SIP Entity “CM-Evolution-procr-5065” at terminating location “BaskingRidge”. This is the expected result from the configuration presented in **Section 6**.

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

SIP INVITE Parameters

Called Party URI 34502@avaya.com	Calling Party Address 192.45.131.1
Calling Party URI 77701@192.45.131.1	Session Manager Listen Port 5060
Day Of Week Tuesday	Time (UTC) 18:01
Called Session Manager Instance SM1	Transport Protocol TCP
<input type="button" value="Execute Test"/>	

Routing Decisions

Route < sip:34502@avaya.com > to SIP Entity CM-Evolution-procr-5065 (10.1.2.90). Terminating Location is BaskingRidge

Scrolling down below the **Routing Decisions** heading, additional information is available that may reinforce understanding of the configuration and decision process. For example, from the following series of screen captures, it can be observed that the originating SIP entity is recognized as “CiscoUCME” in location “Toronto”. The CiscoAdapter is invoked to set, and the P-Asserted-Identity (PAI) is populated with the calling party number. (For an actual call that contained the caller’s name in the Remote-Party-ID field, Session Manager would also copy the calling party name). No location-specific routing entry has been configured, but an “ALL” locations entry matches. The call ultimately is routed to SIP Entity “CM-Evolution-procr-5065”.

Routing Decision Process

6.2.2.2 Avaya Telephone Calls Cisco Telephone

The following screen shows an example of a routing test for an Avaya telephone (34502) calling a Cisco telephone (77701). The Calling Party Address is the IP Address of the Avaya S8800 server running Communication Manager. In this case, TLS and port 5065 is selected.

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

SIP INVITE Parameters

Called Party URI <input type="text" value="77701@avaya.com"/>	Calling Party Address <input type="text" value="10.1.2.90"/>
Calling Party URI <input type="text" value="34502@avaya.com"/>	Session Manager Listen Port <input type="text" value="5065"/>
Day Of Week <input type="text" value="Tuesday"/>	Time (UTC) <input type="text" value="18:01"/>
Called Session Manager Instance <input type="text" value="SM1"/>	Transport Protocol <input type="text" value="TLS"/>
<input type="button" value="Execute Test"/>	

The following screen shows the summary result. The call will be routed to Cisco UCME at IP Address 192.45.131.1, in terminating location "Toronto".

Routing Decisions

Route < sip:77701@192.45.131.1 > to SIP Entity CiscoUCME (192.45.131.1). Terminating Location is Toronto.

Scrolling down below the **Routing Decisions** heading, the originating SIP entity is recognized as “CM-Evolution-procr-5065” in location “BaskingRidge”. No location-specific routing entry is configured for “BaskingRidge”, but the “ALL” locations configuration matches. The call is routed to SIP Entity “CiscoUCME” using TCP and port 5060.

6.2.3 CiscoAdapter Summary for Improved Display Interoperability

Section 7.1.2 and Section 7.1.3 provide a summary of expected displays for basic calls and transferred calls. The CiscoAdapter of Session Manager plays an important role in providing display interoperability. For example, Cisco UCME sends and processes display information that appears in the “Remote-Party-ID”. The Session Manager CiscoAdapter can extract information from standard SIP elements and populate the “Remote-Party-ID” for Cisco UCME consumption. Similarly, the Session Manager CiscoAdapter can extract information from the

“Remote-Party-ID” and populate standard SIP elements for proper processing by Communication Manager.

6.2.3.1 Avaya Telephone Calls Cisco Telephone

When an Avaya telephone calls a Cisco telephone, the SIP INVITE message sent from Communication Manager to Session Manager will include standard SIP information about the caller (e.g., in the From header and P-Asserted-Identity or PAI). As the call passes through Session Manager, Session Manager inserts the Remote-Party-ID containing the name and number of the Avaya caller. The Cisco telephone displays the caller’s information. When the Cisco telephone alerts, Cisco UCME sends a “180 RINGING” SIP message to Session Manager with the Remote-Party-ID containing the “Alerting Name” and number of the ringing telephone. Session Manager extracts the information from the Remote-Party-ID and populates the PAI in the 180 RINGING sent to Communication Manager. Communication Manager displays the name and number of the alerting Cisco user on the calling party’s display. A similar adaptation is performed on the 200 OK message when the Cisco telephone answers the call.

6.2.3.2 Cisco Telephone Calls Avaya Telephone

When a Cisco telephone calls an Avaya telephone, the SIP INVITE message sent from Cisco UCME to Session Manager can include the caller’s name and number in the Remote-Party-ID. As the call passes through Session Manager, Session Manager extracts the caller’s information from the Remote-Party-ID and populates standard SIP elements (e.g., PAI) in the SIP INVITE toward Communication Manager, which displays the caller’s information on the alerting Avaya phone. When the Avaya telephone rings, Communication Manager sends a “180 RINGING” SIP message to Session Manager with the name and number of the ringing user in standard SIP elements (e.g., Contact, PAI). Session Manager extracts the alerting party information and populates the Remote-Party-ID for the 180 RINGING back to Cisco UCME. Cisco UCME gets the name and number of the alerting Avaya; however Cisco UCME then sends a “183 Session Progress” message to the Cisco SIP Telephone with no Called Party Name in the “Remote-Party-ID” header (e.g. Remote-Party-ID:

sip:34502@192.45.131.1>;party=called;screen=no;privacy=off). Similar results were observed with Cisco SCCP telephones. A similar adaptation is performed on the 200 OK message when the Avaya telephone answers the call. The Cisco Telephone updates the display with the name and number received in the “200 OK” message (e.g. Remote-Party-ID: “Tom Avaya” sip:34502@192.45.131.1>;party=called;screen=no;privacy=off) when the call is answered.

6.2.4 SIP Message Tracing

This section provides examples of Session Manager SIP message traces using the sample configuration. To configure tracing, select **Elements** → **Session Manager** → **System Tools** → **SIP Tracer Configuration** as shown below. **Section 9** of reference [2] provides details on the available SIP tracing and filtering options available via this screen.

From Server to Security Module:

Trace Dropped Messages:

Send Trace to a Remote Server:

Remote Server FQDN or IP Address:

Stunnel Port:

From Security Module to Network:

From Security Module to Server:

Max Dropped Message Count:

Send Trace Method:

User Filter

<input type="checkbox"/>	From	To	Source	Destination	Max Message Count
--------------------------	------	----	--------	-------------	-------------------

Once the tracer configuration has been established, SIP message traces can be viewed by selecting **Elements → Session Manager → System Tools → SIP Trace Viewer**. The following screen shows an example of an expanded SIP INVITE message sent by Communication Manager to Session Manager. Note that SIP message tracing visibility via Session Manager is still possible when TLS is used between Communication Manager and Session Manager. That is, it is not necessary to change the transport to TCP in order to have visibility into the SIP messages as is typically the case using a line monitoring tool.

6.3 Verify Cisco Unified Communications Manager Express

The following commands can be used to troubleshoot calls over SIP trunks:

Show commands:

- **show ephone registered** - verifies ephone registration.
- **show voice register all** – displays all SIP configuration and register information.
- **show call active voice brief** - displays active call information for voice calls.

- **show voip rtp connection** - displays RTP named-event packet information (e.g. caller-ID number, IP Address, and ports).
- **show sip-ua call** - displays active call SIP user agent information.

Debug commands:

- **debug ccsip message** - displays all SIP messages.
- **debug ccsip calls** - displays SIP call trace information.
- **debug sccp message** - displays the sequence of the SCCP messages.
- **debug voip rtp session named – events** - enables debugging for RTP named events packets.

7. Conclusion

As illustrated in these Application Notes, Avaya Aura® Communication Manager R6.0 SP 2 can interoperate with Cisco Unified Communications Manager Express R8.1 “IOS 15.1(2)T1” using SIP trunks via Avaya Aura® Session Manager R6.0 SP1. The following is a list of interoperability issues to note:

- Cisco SIP Telephones could not blind transfer active calls with Avaya Telephones to Cisco SCCP Telephones. All attempts to perform such operation failed, causing Cisco UCME to display memory allocation failure (MALLOCFAIL) messages. Attended transfer scenarios did not have this issue.
- During testing, Cisco UCME did not “shuffle” audio directly between the Avaya IP telephones and the Cisco IP telephones. All RTP traffic went through Cisco UCME.
- Calling and Called Party Name and Number displays may not be consistent in some cases for calls involving transfers, conferences, and call forwarding.
- Restricted presentation of display information is either off, (i.e., both name and number appear on the display), or privacy is full, where neither name nor number are presented on the display. That is, it is not possible to restrict only the number but display the name, or restrict only the name, and display the number.
- Privacy calls between Avaya telephones and Cisco SIP telephones did not work as expected:
 - Invoking privacy on calls between Avaya SIP telephones and Cisco SIP telephones resulted in privacy being invoked on both the calling and called parties. Cisco UCME returns a Remote-Party-ID header with “privacy=full” in the “180 RINGING” message, therefore restricting the presentation of display information on the Avaya telephones.
 - Invoking privacy on calls between Cisco SIP telephones and Avaya telephones, Cisco SIP telephones and Cisco SCCP telephones, or just between Cisco SIP telephones resulted in privacy being invoked on both the calling and called parties. Such calls include the proper SIP messaging between the Avaya and Cisco systems; however Cisco UCME sends a Remote-Party-ID header with “privacy=full” in the final “200OK” message to the Cisco SIP Telephone restricting the presentation of display information on the Cisco SIP Telephone.
 - Privacy calls between Avaya telephones and Cisco SCCP telephones worked as expected.
