

Avaya Solution & Interoperability Test Lab

Configuring Avaya 9600 Series IP Telephone VPN feature for Certificate Authentication using Cisco 5510 Adaptive Security Appliance and Microsoft Certificate Authority with Avaya Aura™ Communication Manager running on Avaya Aura™ Midsize Enterprise Single Server - Issue 1.0

Abstract

These Application Notes describes the configuration steps required to configure the Avaya 9600 IP Telephone VPN feature for Certificate Authentication using Cisco 5510 Adaptive Appliance and Microsoft Certificate Authority with Avaya Aura™ Communication Manager running on Avaya Aura™ Midsize Enterprise Single Server. The Application Notes identifies how to generate digital certificates using the Microsoft Certificate Authority and download these certificates to the Avaya 9600 Series IP Telephone and to administer the Cisco Adaptive Security Appliance to establish and terminate an IPSec VPN tunnel request from the Avaya 9600 Series VPN enabled IP Telephone.

The validation test of the sample configuration was conducted at the Avaya Solution and Interoperability Test Lab at the request of the Avaya Solutions and Marketing Team.

1. Introduction

The Microsoft Certificate Authority can issue multiple certificates in the form of a tree structure. A root certificate is the top most certificate of the tree, the private key of which is used to sign other certificates. All certificates immediately below the root certificate inherit the trustworthiness of the root certificate. A signature by a root certificate is somewhat analogous to notarizing an identity in the physical world. Certificates further down the tree also depend on the trustworthiness of the intermediates often known as subordinate certification authorities. Many software applications assume these root certificates are trustworthy on the user's behalf.

The 9600 Series IP Telephones support Media Encryption SRTP and use built in Avaya certificates for trust management. Trust management involves downloading certificates for additional trusted Certificate Authorities (CA) and the policy management of those CAs. Identity management is handled by Simple Certificate Enrollment Protocol (SCEP) with phone certificates and private keys. Simple Certificate Enrollment Process applies to the VPN operation or to standard enterprise network operation. The Simple Certificate Enrollment Protocol is the protocol used by the Microsoft CA to securely transport key information and digital certificates to network devices, such as the Avaya 9600 IP telephone and Cisco Adaptive Security Appliance. For the Microsoft CA to support SCEP, the Microsoft SCEP add-on for Certificate Services has been installed. Information on how to obtain and install the SCEP add-on is included in the **Section 3** of these Application Notes.

1.1. Interoperability Compliance Testing

The objective of this interoperability test is to verify that the Avaya 9600 IP telephone can provide VPN functionality with Certificate Authentication using Cisco Adaptive Security Appliance and Microsoft Certificate Authority with Avaya AuraTM Communication Manager 5.2.1 and Avaya AuraTM SIP Enablement Services 5.2 running on Avaya AuraTM Midsize Enterprise Single Server. Testing was carried out on codec support and negotiation supported by Avaya 9600 IP telephones and as well as supplementary features such as Call Hold, Forward, Transfer and Conference between the Avaya IP and SIP endpoints.

1.2. Configuration

The configuration used in these Application Notes is shown in **Figure 1**. The Avaya Aura™ Midsize Enterprise software is installed and configured on Avaya Aura™ System Platform on a S8500C Media Server. The Avaya Aura™ Midsize Enterprise Single Server is a template running software applications. These software applications include Avaya Aura™ Communication Manager, Avaya Aura™ SIP Enablement Services and Avaya Aura™ Application Enablement Services. The Avaya Aura™ Midsize Enterprise Media Server is connected to an Extreme Summit x250e 24P switch and is configured in a separate vlan. The IP telephones are physically connected to a single Cisco Catalyst 3750E-24P switch and are administered in a single subnet. The 9600 IP telephones register to Avaya Aura™ Communication Manager running on the Avaya Aura™ Midsize Enterprise Single Server and are administered as H.323 stations. Both the Extreme Summit x250e 24P switch and the Cisco Catalyst 3750E-24P switch are connected to an Extreme Summit x450e 48P router. Each of the two switches is configured with an uplink trunk port to connect to the router. The Microsoft Windows 2003 Server Certificate Authority is used to generate the digital certificates used by the 9600 Series IP Telephone and Cisco Adaptive Security Appliance. The Microsoft CA in the sample configuration is used in the enterprise network as a private certificate server for internal use. The Cisco Adaptive Security Appliance is configured for automatic certificate enrollment. The Cisco Adaptive Security Device Manager (ASDM) graphical user interface application is used to configure the Cisco ASA. The Juniper SSG 5 router provides broadband internet connection.

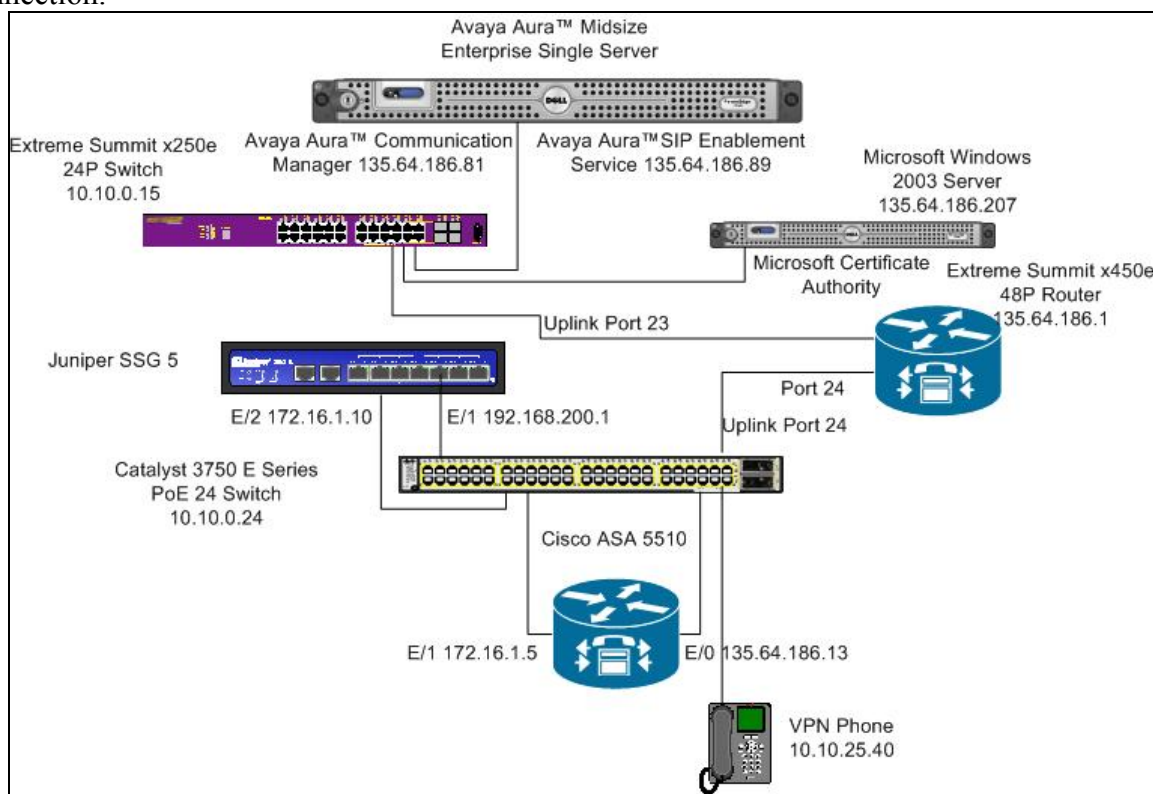

Figure 1: Avaya Aura™ Midsize Enterprise Single Server with Cisco Adaptive Security Appliance

2. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Avaya Aura™	Software
Avaya Aura™ Midsize Enterprise Single Server on a S8500C Media Server	Avaya Aura™ Midsize Enterprise R5.2 Release 5.2.1.2.5 Avaya Aura™ Communication Manager R5.2.1 Release 5.2.1 R15x.02.1.016.4 Update: Service Pack 0 Avaya Aura™ SIP Enablement Services R5.2 Release SES05.2.1.016.4 Update: Service Pack 0 Avaya Aura™ Application Enablement Services R5.2 Release 5.2.0.98 Update: Service Pack 0
Avaya one-X® 9600 Series IP Telephones (H.323)	Release 3.1
Cisco Catalyst 3750 PoE 24P Switch	SW Ver. 12.2(35)SE5
Extreme Summit x250 24P Switch	Release 12.0.3.16
Extreme Summit x450 48P Router	Release 12.0.3.16
Cisco 5510 Adaptive Security Appliance	Release 7.21
Cisco Adaptive Security Device Manager	Release 5.21
Juniper SSG	Release 6.2
Microsoft Windows 2003 Server	Microsoft Windows 2003 Server Version 2003 Update: Service Pack 2

3. Install Simple Certificate Enrollment Protocol

This section describes how to install the Simple Certificate Enrollment Protocol add-on to an existing Microsoft CA. It also describes how to download the digital certificate generated by the Simple Certificate Enrollment Protocol to the 9600 IP telephone. The Simple Certificate Enrollment Protocol is the protocol used by the Microsoft CA to securely transport key information and digital certificates to network devices, such as the Avaya 9600 IP telephone and Cisco Adaptive Security Appliance. The Simple Certificate Enrollment Protocol add-on is available from the Windows Server 2003 Resource Kit or by downloading directly from the Microsoft Download Center at the following URL:

<http://www.microsoft.com/downloads/details.aspx?familyid=9f306763-d036-41d8-8860-1636411b2d01&displaylang=en>

3.1. Access Windows 2003 Server

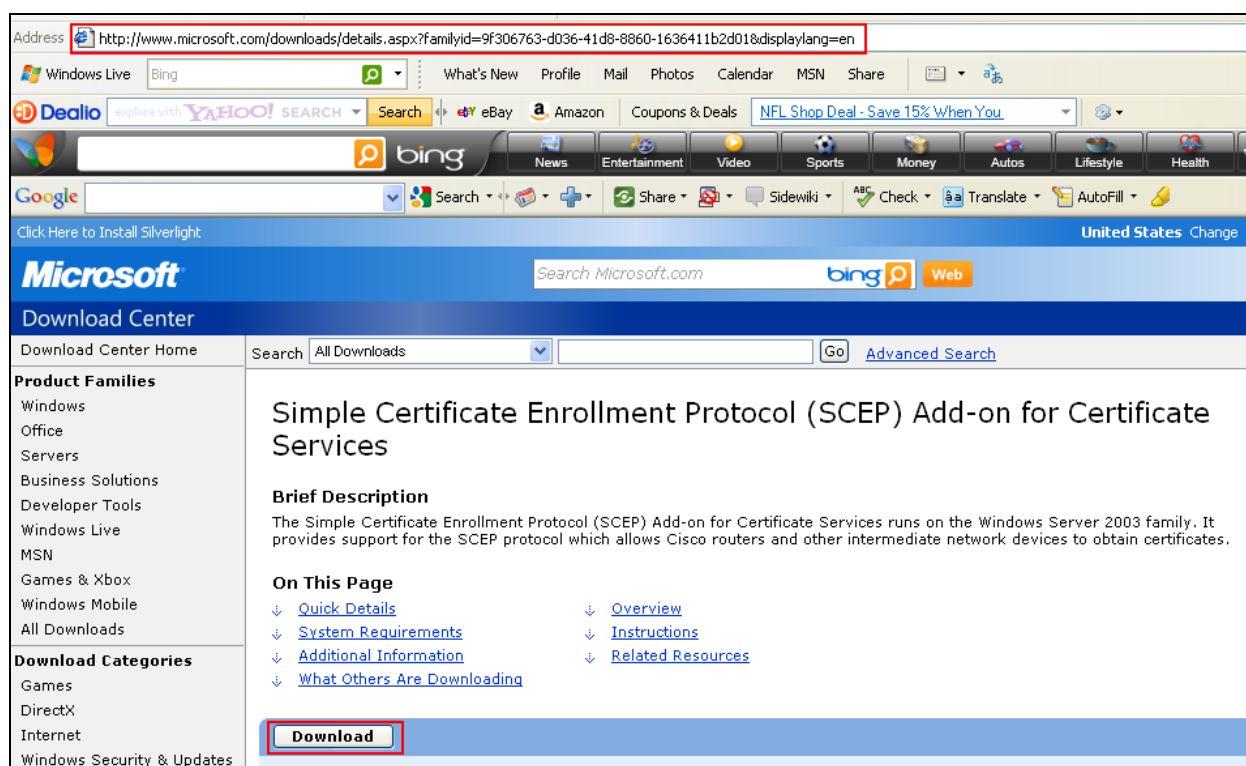

To access the Windows 2003 Server where the Simple Certificate Enrollment Protocol will be located, open a remote desktop connection and input the IP Address of the Windows 2003 Server. This was **135.64.186.207**. Press **Connect** to access the Windows 2003 Server.

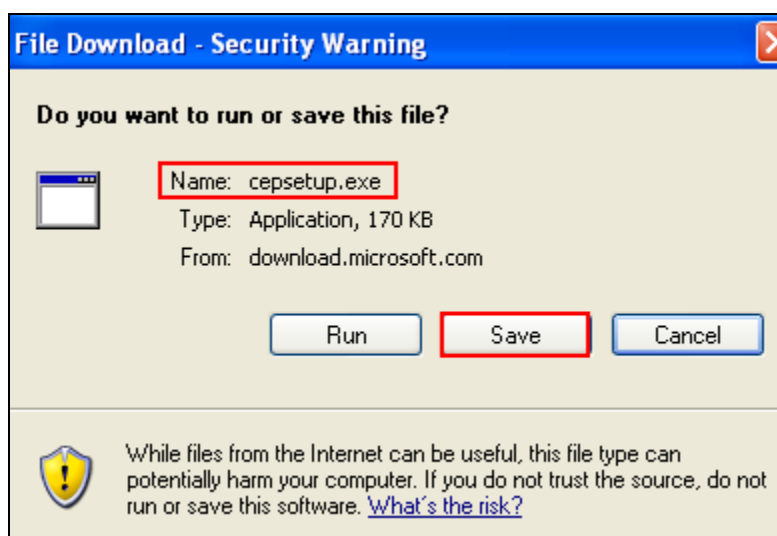

Login with the appropriate credentials.

Access the URL **<http://www.microsoft.com/downloads/details.aspx?familyid=9f306763-d036-41d8-8860-1636411b2d01&displaylang=en>** and download the Simple Certificate Enrollment Protocol add-on for Certificates Services by pressing the **Download** button.

Save the **cepsetup.exe** file to a location on the Windows 2003 Server.

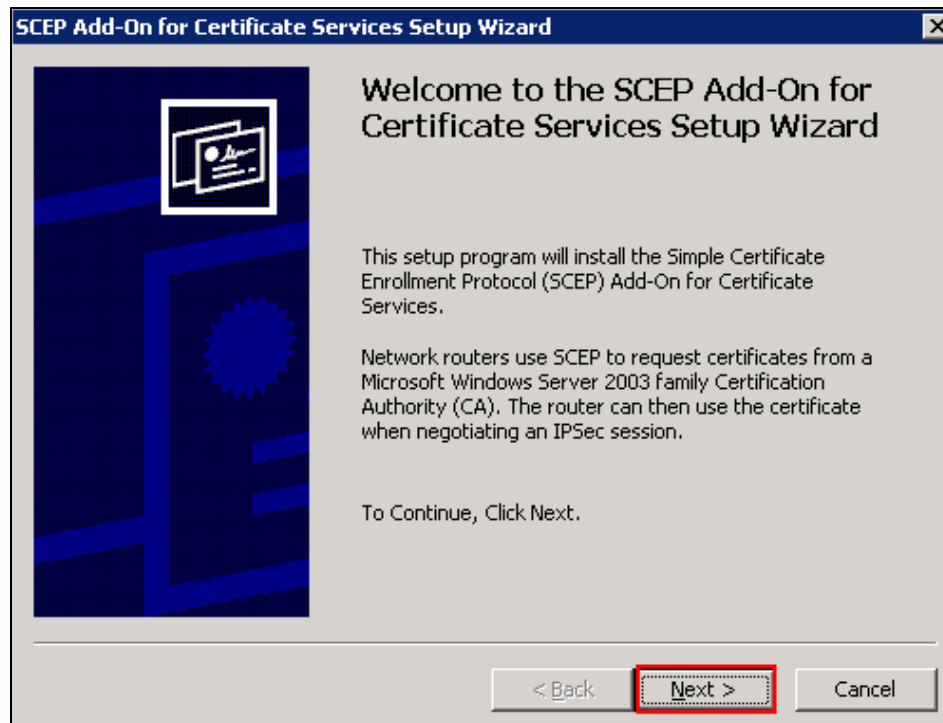

Run the **cepsetup.exe** file

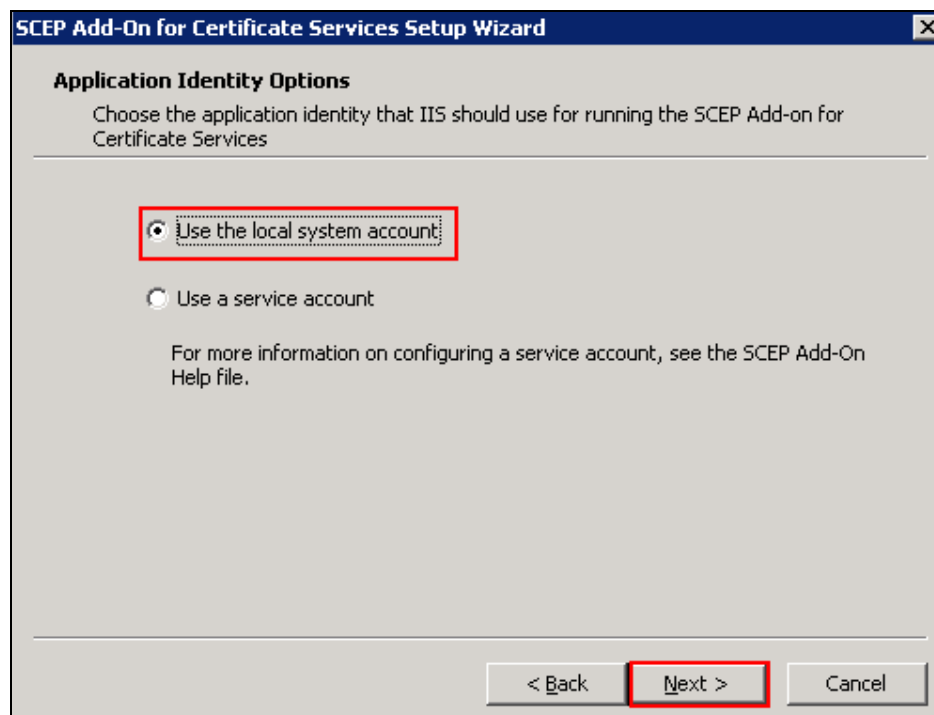

The user is prompted with the following prompt. Press the **YES** button to continue the installation.

The **Welcome to the SCEP Add-On for Certificates Services Setup Wizard** page is shown in the screenshot below. Press the **Next** button

Select **Use the local system account** and press the **Next** button

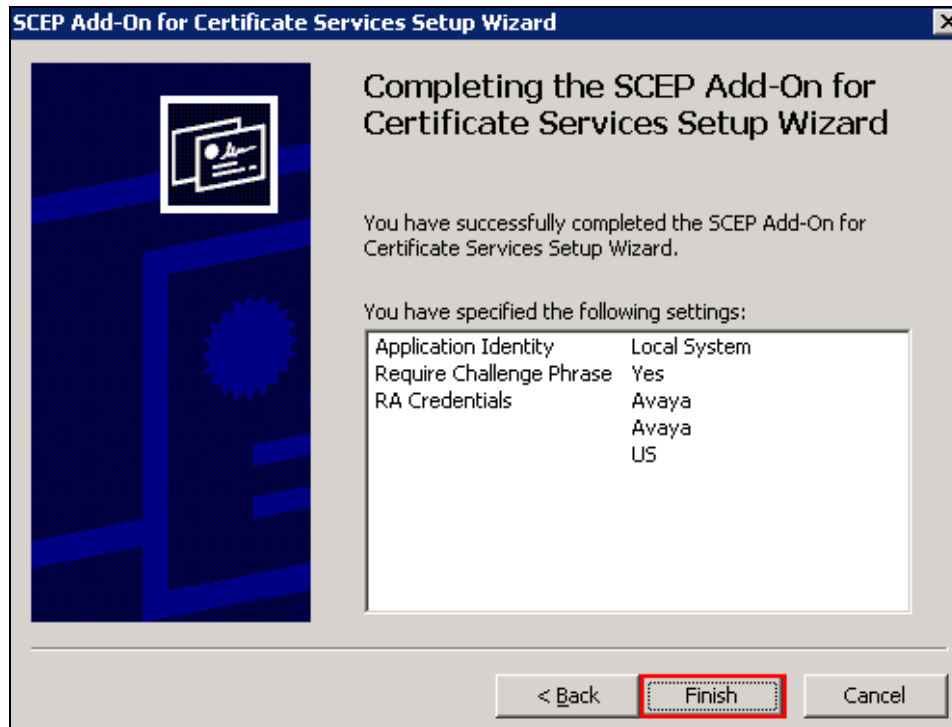

Enable **Require SCEP Challenge Phrase to Enroll** and press the **Next** button. As recommended by Microsoft, the Challenge Phrase option is enabled in the sample configuration.

The screenshot shows the 'SCEP Add-On for Certificate Services Setup Wizard' window. The title bar is blue with the text 'SCEP Add-On for Certificate Services Setup Wizard' and a close button. The main window has a light gray background. At the top, the section 'Challenge Phrase Options' is displayed. Below it, a subtitle reads: 'Select the challenge phrase if you wish the CA to automatically issue certificates to SCEP requests'. A checkbox labeled 'Require SCEP Challenge Phrase to Enroll' is checked and highlighted with a red rectangle. Below the checkbox, there is explanatory text: 'The SCEP protocol allows the router to provide a challenge phrase to the CA. In the Microsoft SCEP implementation this phrase is used as one time password that is used to authenticate the router making the request. The administrator configuring the router asks the CA for a challenge phrase. The administrator then provides this phrase during SCEP configuration. Note: This option is strongly recommended to increase the security of SCEP certificate requests.' At the bottom of the window, there are three buttons: '< Back', 'Next >' (highlighted with a red rectangle), and 'Cancel'.

Enter the required information below and press the **Next** button.

The screenshot shows the 'SCEP Add-On for Certificate Services Setup Wizard' window. The title bar is blue with the text 'SCEP Add-On for Certificate Services Setup Wizard' and a close button. The main window has a light gray background. At the top, the section 'SCEP RA Certificate Enrollment' is displayed. Below it, a subtitle reads: 'Enter the below information to enroll for the RA certificates'. There are several text input fields: 'Name' (containing 'Avaya'), 'Email' (empty), 'Company' (containing 'Avaya'), 'Department' (empty), 'City' (empty), 'State' (empty), and 'Country/Region' (containing 'US'). Below these fields is a checkbox labeled 'Advanced Enrollment Options' which is unchecked. Below the checkbox, there is explanatory text: 'The SCEP Add-On needs a special certificate (RA Certificate) that allows it to make request to the CA on behalf of the router.' At the bottom of the window, there are three buttons: '< Back', 'Next >' (highlighted with a red rectangle), and 'Cancel'.

Press the **Finish** button.

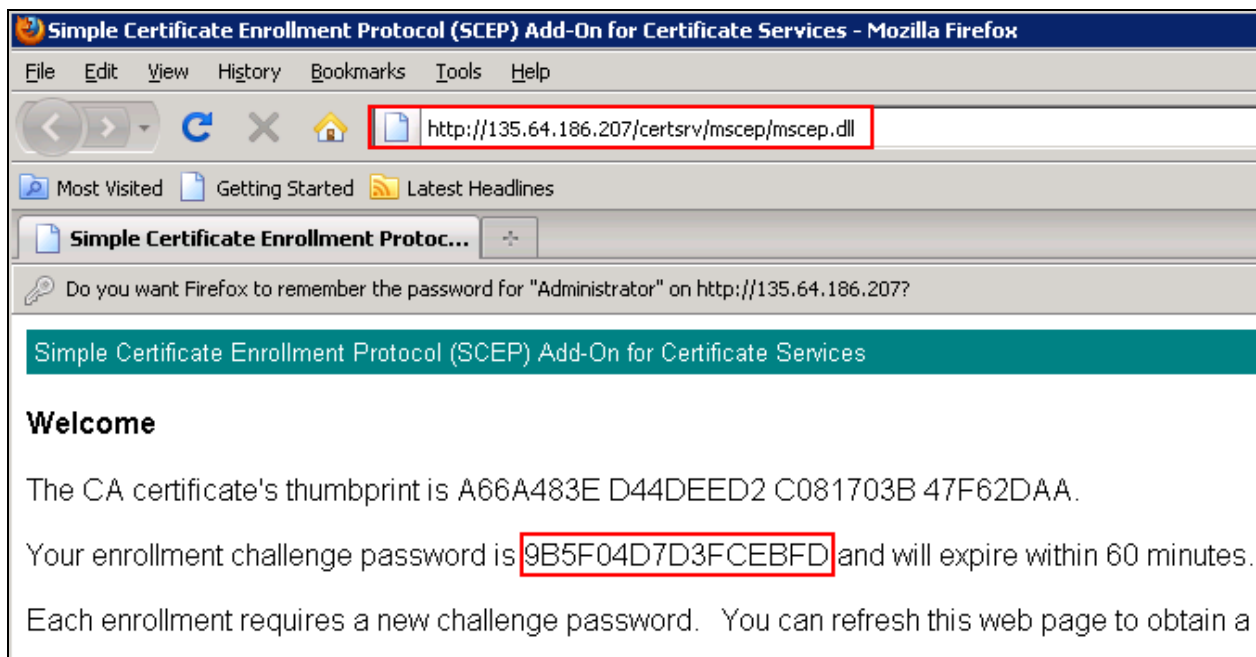

The following prompt is seen. Press the **OK** button.

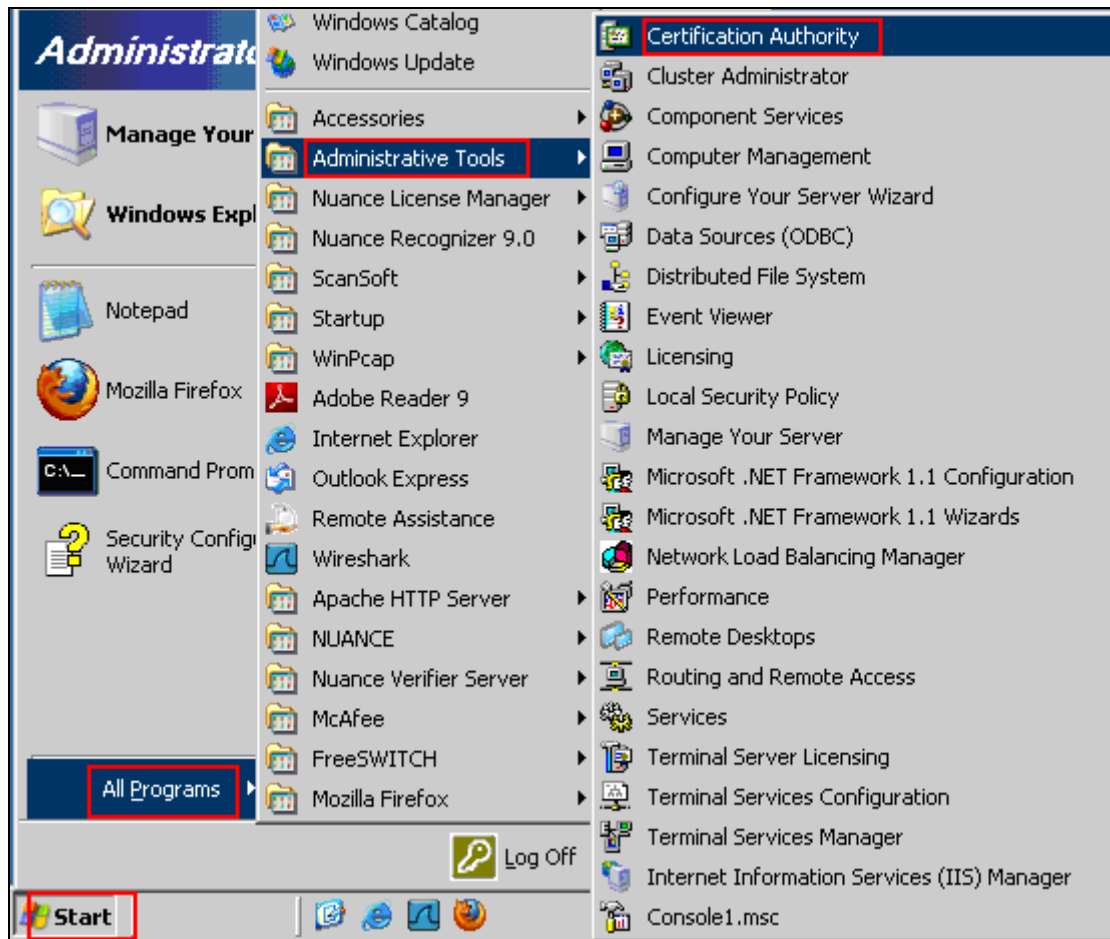

3.2. Generate Simple Certificate Enrollment Protocol Password

From a web browser, go to the URL **http://135.64.186.207/certsrv/mscep/mscep.dll**, where 135.64.186.207 is the ip address of the Windows 2003 Server where the Simple Certificate Enrollment Protocol is stored. The following page is displayed as shown below. The enrollment challenge password is generated **9B5F04D7D3FCEBFD** in the example below. The password will expire after 60 minutes from the time it was generated and is only able to be used once. The Challenge Phrase is a one time password generated by the Microsoft CA at the request of an administrator. Once the Challenge Phrase is used, it becomes invalid and a new challenge phrase request must be sent to the Microsoft CA to generate a password. This ensures certificates will not be downloaded from the Microsoft CA by unwanted devices. Because the Challenge Phrase is only valid for one time use, a new request must be made for each Avaya 9600 Series IP telephone to import the digital certificate to the phone.

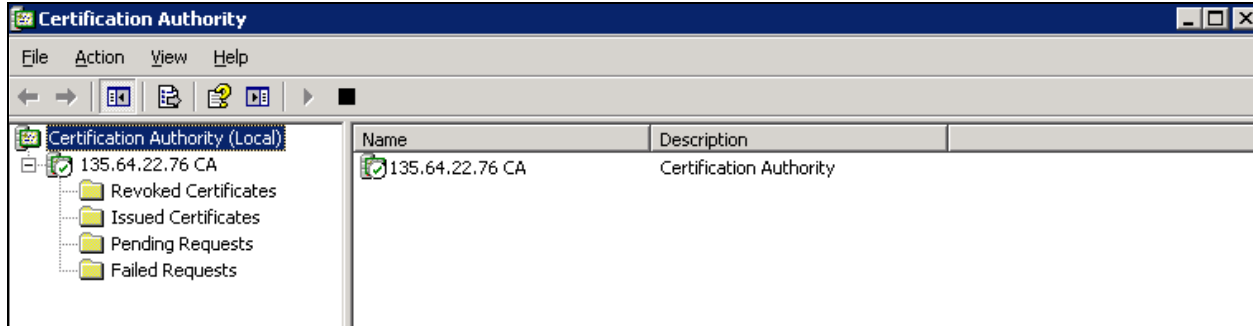

3.3. Export Certificate to .CER file

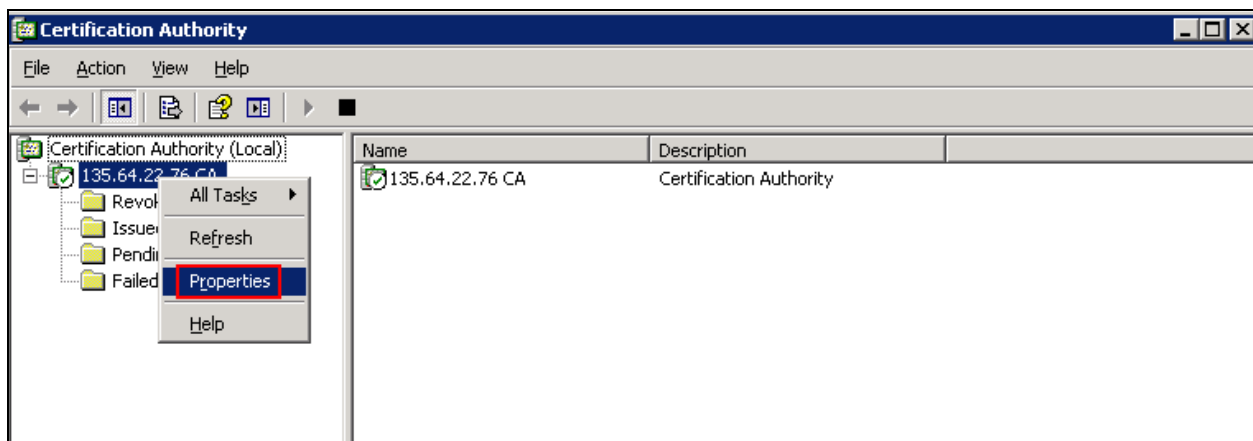

To open the Microsoft Certificate Authority click **Start**→**All Programs**→**Administrative Tools**→**Certification Authority**. For the Avaya 9600 IP telephone to download the digital certificate, the certificate must first be exported from the Microsoft CA to a file with a .cer extension. Microsoft Windows associates files containing a .cer extension with a file type of Security Certificate. The .cer file is then copied to the upload directory of the HTTP server.

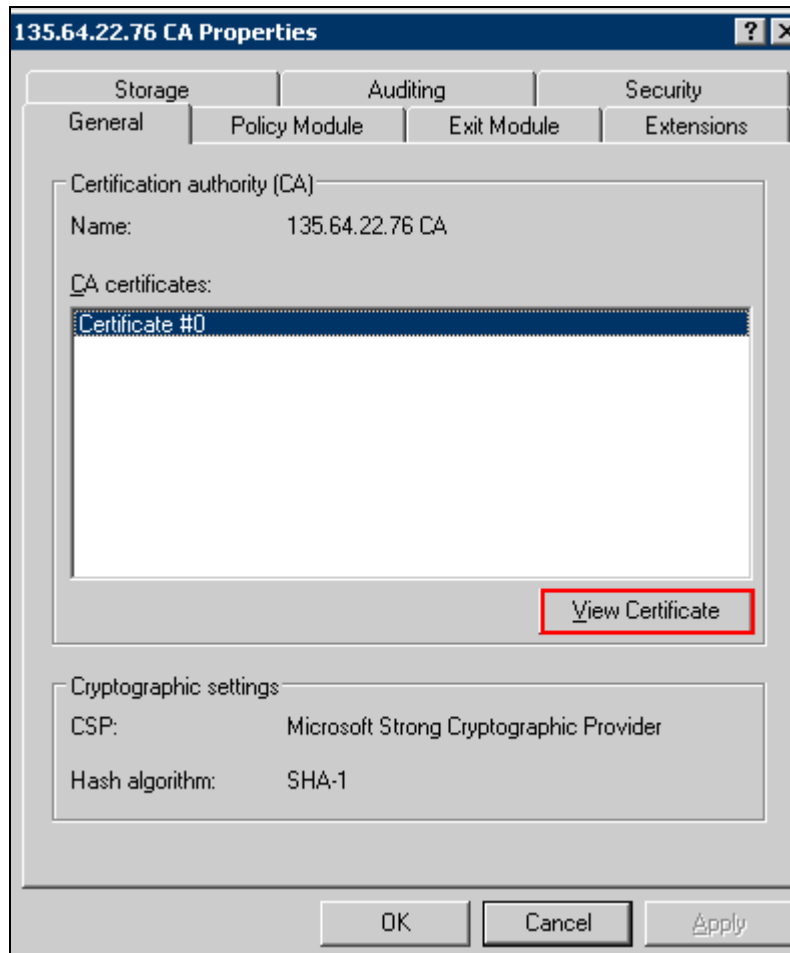

The following screenshot is displayed.

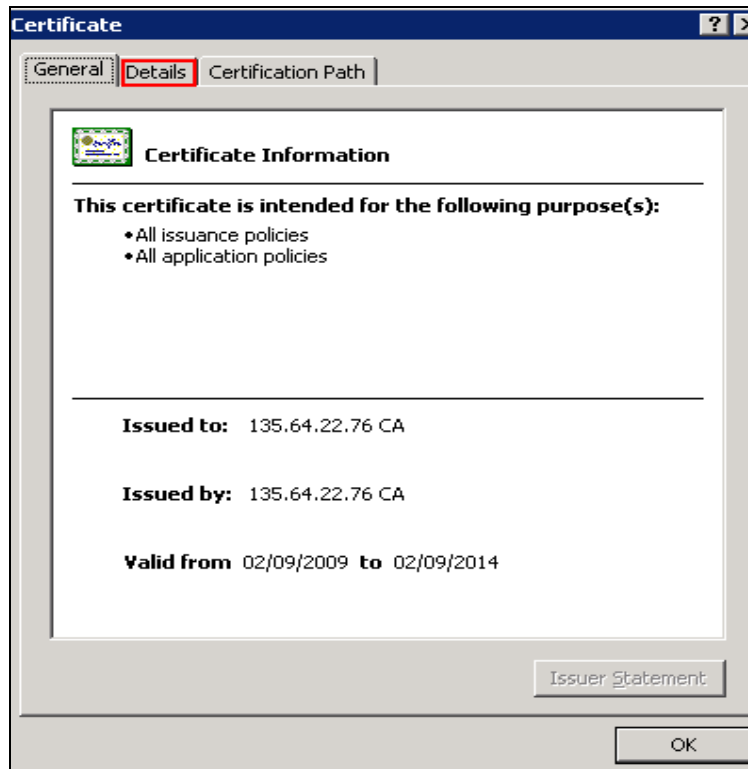

From the Microsoft CA management window right click on the CA name and select **Properties**.

The following screenshot is shown below. Click on the **View Certificate** button.

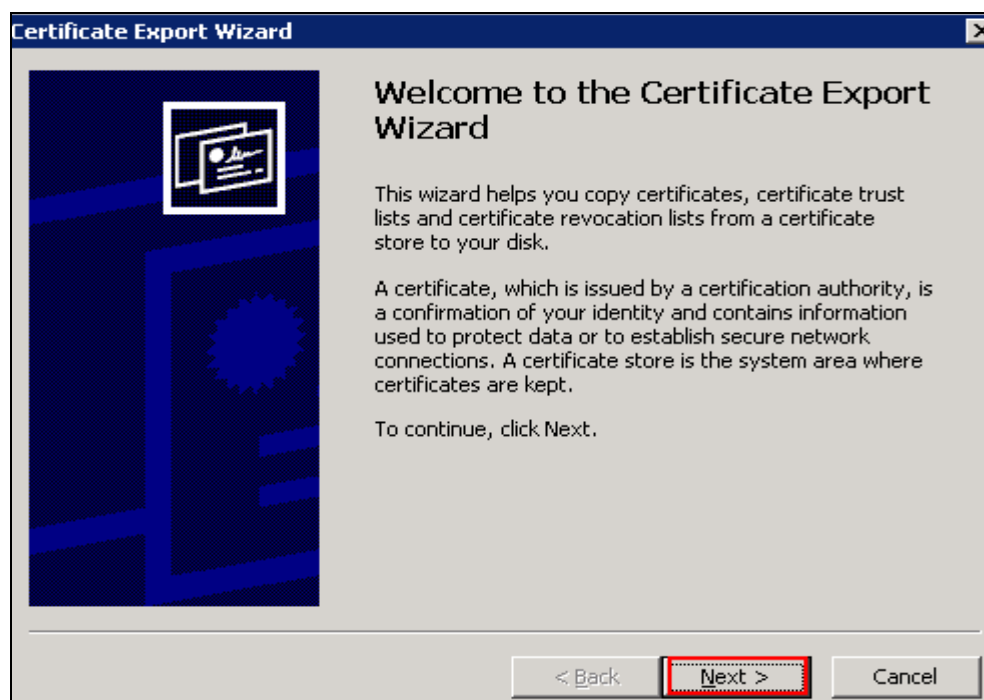

Click on the **Details** tab of the **Certificate** window.

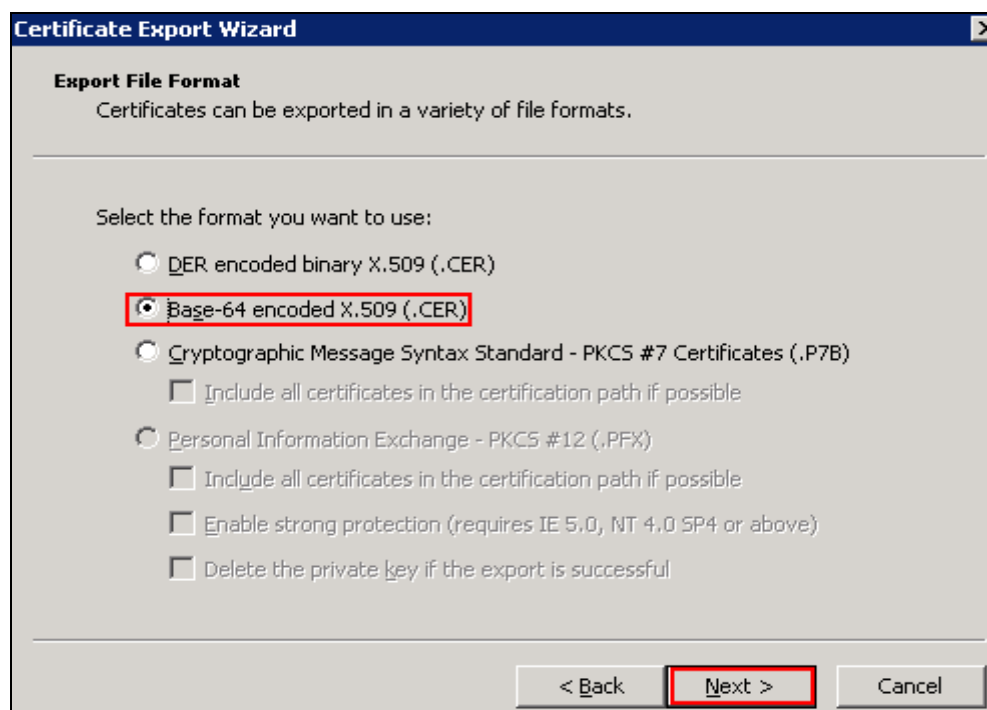

Select **Copy to File**.

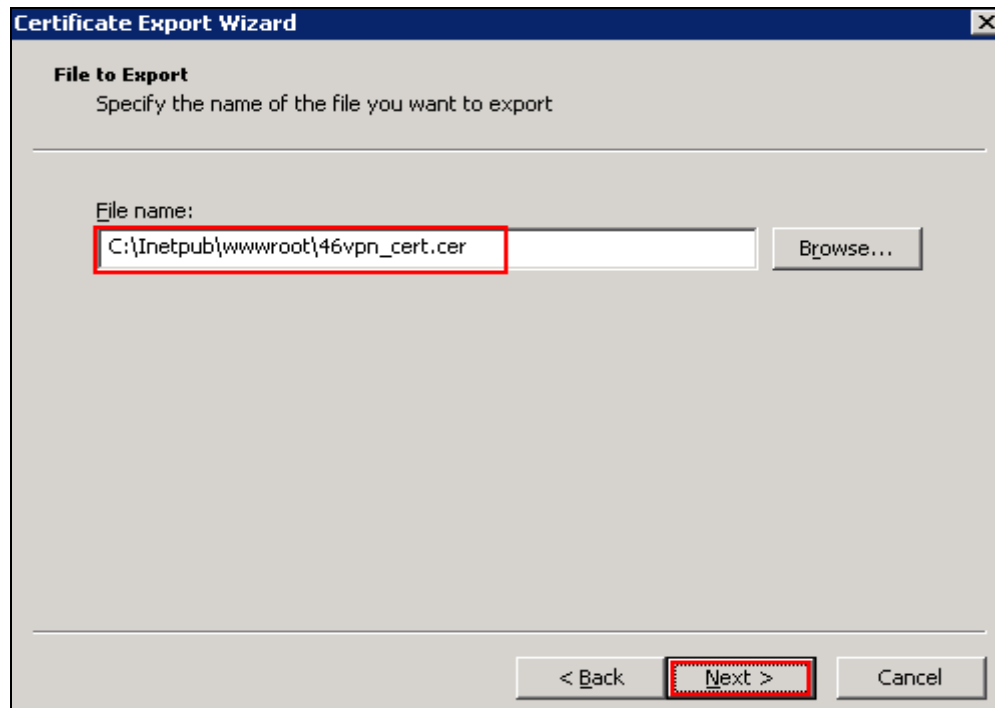

The **Welcome to the Certificate Export Wizard** page is displayed. Click on the **Next** button.

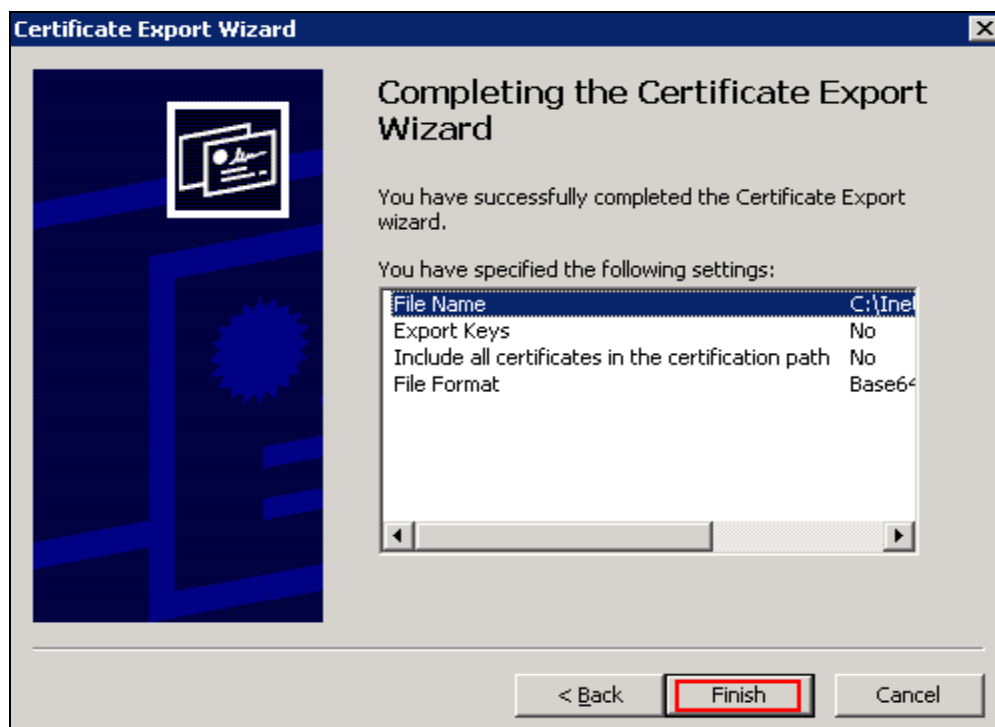

Select the **Base-64 encoded X.509 (.CER)** option and select the **Next** button.

Specify a location to store the certificate file. The file was stored in **C:\Inetpub\wwwroot** location. Select the **Next** button.

The **Completing the Certificate Export Wizard** screen is shown. Select the **Finish** button.

The **export was successful** dialog box was shown to confirm the successful export of the certificates.

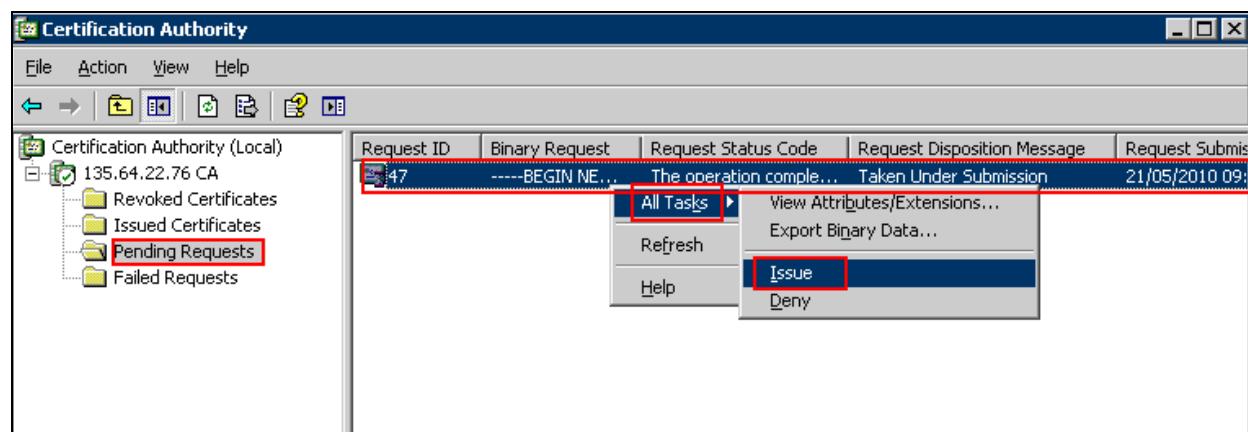

3.4. Upload Certificates to 9600 IP Telephone

To upload the exported certificates to the 9600 IP telephone the 46xxsettings file is used. A number of settings need to be adjusted within the settings file to accomplish this. The **SCEPPASSWORD** and **SET TRUSTCERTS** variables need to be set. The SCEPPASSWORD is set to the password generated in **Section 3.2**. SET TRUSTCERTS is set to the file name **46vpn_cert.cer**, the file name of the exported certificates in **Section 3.3**. With these settings put into the 46xxsettings file the 9600 IP telephone is rebooted to upload the new 46xxsettings file to the 9600 IP telephone. When the 9600 IP telephone receives the 46xxsettings file, the IP telephone will enroll with the Microsoft CA. The 9600 IP telephone begins the uploading of the certificates to the IP telephone. The SCEP timeout is displayed on the 9600 IP telephone as the certificates are uploaded.

SCEP 10 secs

The 9600 IP telephone has begun requesting the certificates from the Microsoft CA and will continue requesting the certificate for 60 minutes until the certificate is issued. On the Microsoft CA the certificates are currently in a Pending state and need to be issued to the 9600 IP telephone by the user for the uploading of the certificates to take place. From the **Pending Request** folder in the Microsoft CA subfolder right click on the pending certificate. Highlight the **All Tasks** heading and select **Issue**. This completes the uploading of the certificates

The following screen is displayed on the 9600 IP telephone.

4. Configure Cisco 5510 Adaptive Security Appliance

The Cisco 5510 Adaptive Security Appliance was configured using Adaptive Security Device Manager software. The following steps describe how generate a keypair, create and authenticate a Trustpoint and enroll the TrustPoint with the Microsoft Certificate Authority. It also describes the steps needed to create the IPSec VPN tunnel and VPN user accounts using the Adaptive Security Device Manager VPN Wizard of the Adaptive Security Device Manager application.

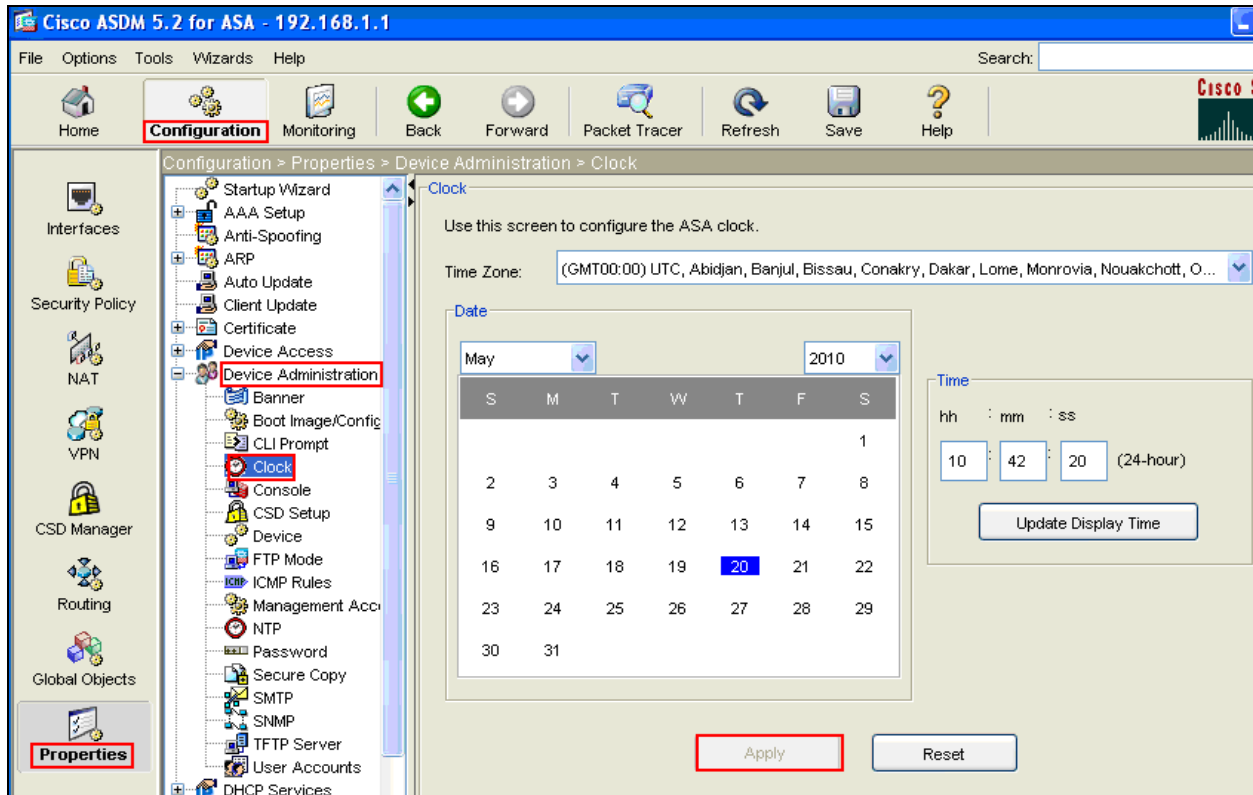

4.1. Access the Cisco 5510 Adaptive Security Device

The Adaptive Security Device Manager can be accessed by accessing the management interface of the Cisco 5510 Adaptive Security Appliance. The **IP Address** of the management interface 0/0 was **192.168.1.1**. Type the **Username** and **Password** and press the **OK** button.

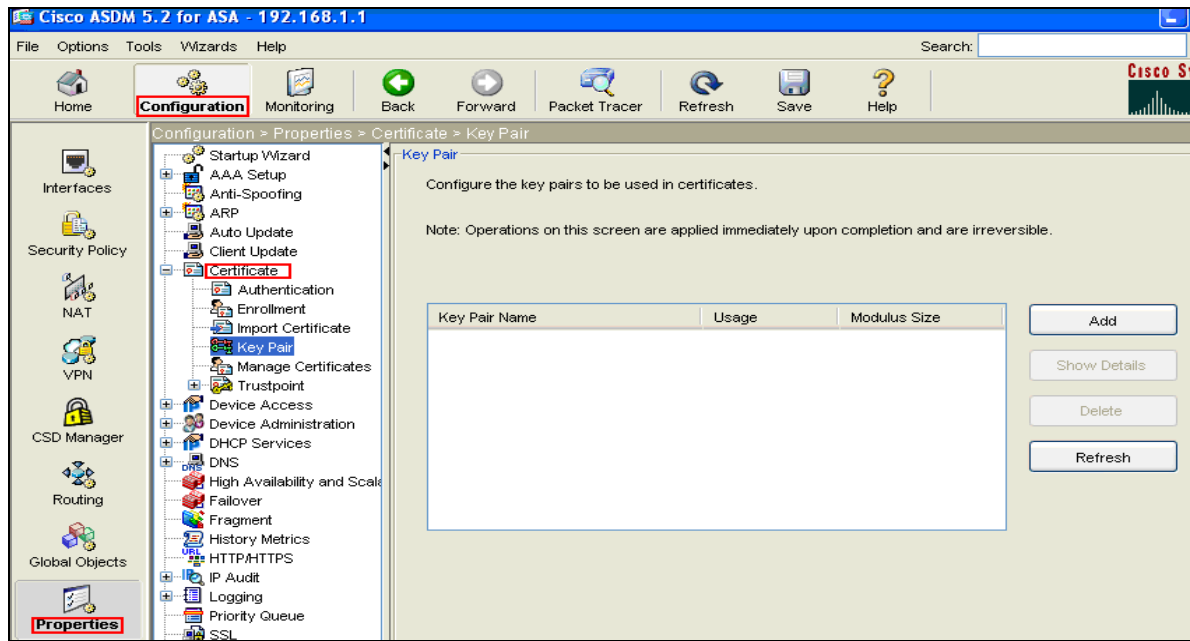

4.2. Set Date and Time on Cisco ASA

To set the date and time on the Cisco 5510 Adaptive Security Appliance, select **Configuration**, then **Properties**, then **Device Administration** and then select **clock**. Set the correct date and time on the system. Press the **Apply** button.

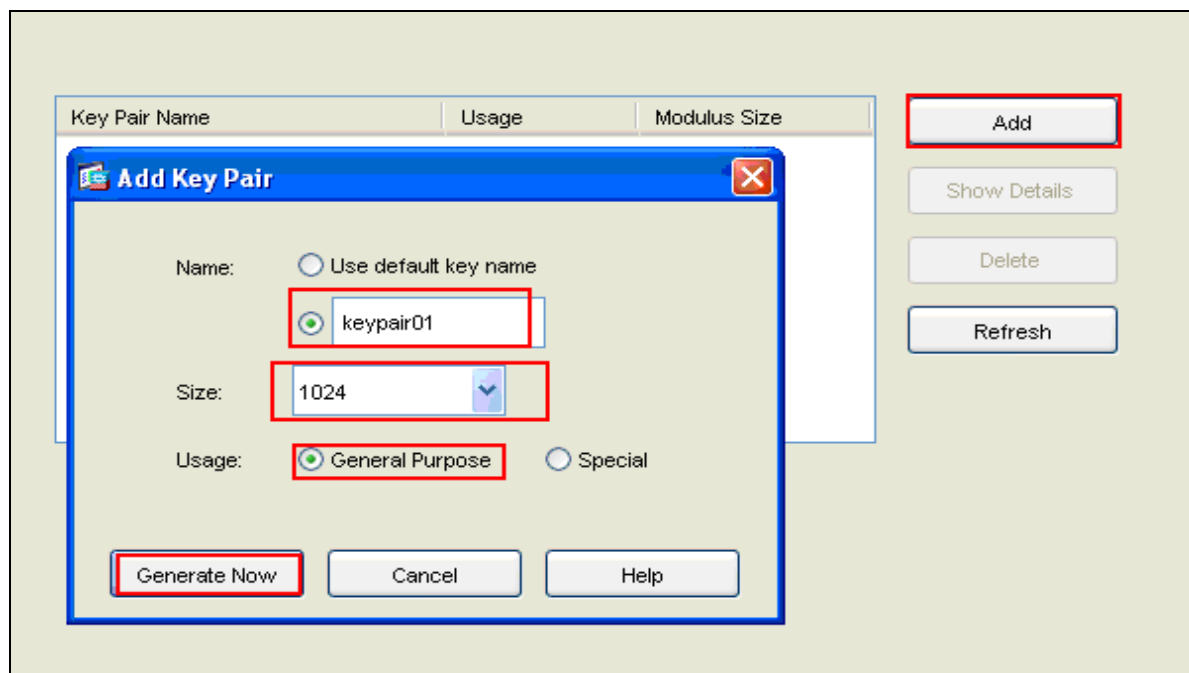

4.3. Generate Keypair

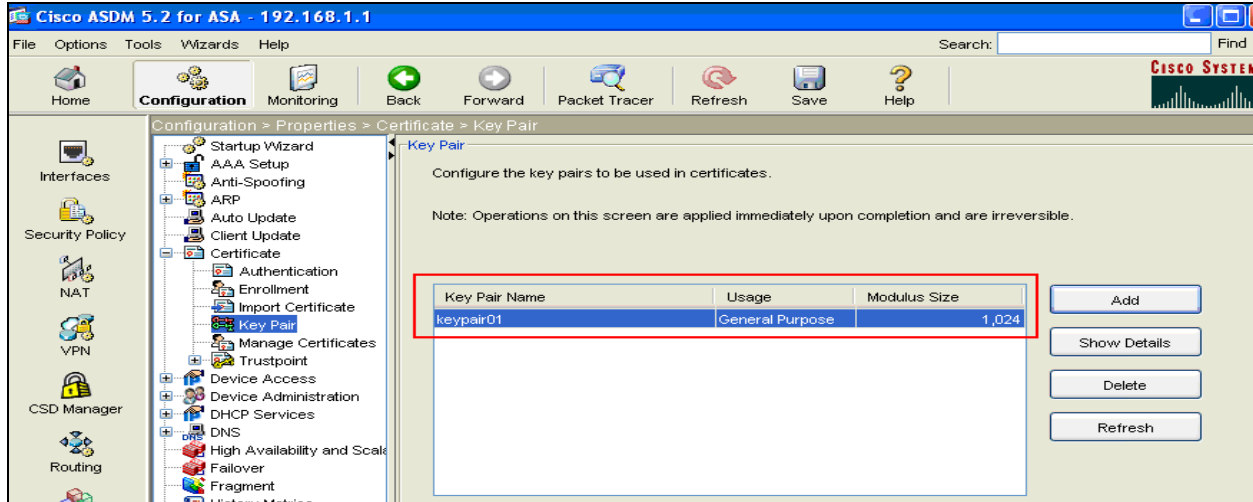

Configure the Cisco ASA key pair. The Cisco ASA must have its own private and public keys. The public key will be sent to the Microsoft CA during enrollment in **Section 4.6**. Select **Configuration**, then **Properties**, then **Certificate** then **Keypair**.

Select the **Add** button and set the keypair **Name** to **keypair01**, set the **Size** to **1024** and **Usage** to **General Purpose**. Press the **Generate Now** button

The following screenshot is shown with **keypair01** generated.

4.4. Create and Authenticate a TrustPoint

To add a new Trustpoint select **Configuration**, then **Properties**, then **Certificate** then **TrustPoint** then **Configuration**. The **Trustpoint name** was set to **Certificate**. Under **Enrollment Settings** set the **Key Pair** to **keypair01** as created in **Section 4.3**, set the **Challenge Password** to the password generated in **Section 3.2**. Choose the **Use automatic enrollment** and set the **Enrollment URL** to <http://135.64.186.207/certsrv.mscep/mscep.dll/135.64.186.207> is the IP Address of the Microsoft CA Server. Press the **OK** button.

Add Trustpoint Configuration

Trustpoint Name:

☐ Generate a self-signed certificate on enrollment
If this option is enabled, only Key Pair and Certificate Parameters can be specified.

Enrollment Settings | Revocation Check | CRL Retrieval Policy | CRL Retrieval Method | OCSP Rules | Advanced

Key Pair:

Challenge Password: Confirm Challenge Password:

Enrollment Mode can only be specified if there are no certificates associated with this trustpoint.

Enrollment Mode

☐ Use manual enrollment
☒ Use automatic enrollment

Enrollment URL:

Retry Period: minutes
Retry Count: (Use 0 to indicate unlimited retries)

Under the **CRL Retrieval Method**, set the **Enable Simple Certificate Enrollment Protocol (SCEP)** checkbox. Press the **OK** button.

Edit Trustpoint Configuration

Trustpoint Name: certificate

☐ Generate a self-signed certificate on enrollment
If this option is enabled, only Key Pair and Certificate Parameters can be specified.

Enrollment Settings | Revocation Check | CRL Retrieval Policy | **CRL Retrieval Method** | OCSP Rules | Advanced

Specify the retrieval methods to be used to retrieve Certificate Revocation List

☐ Enable Lightweight Directory Access Protocol (LDAP)

LDAP Parameters

Name:

Password: Confirm Password:

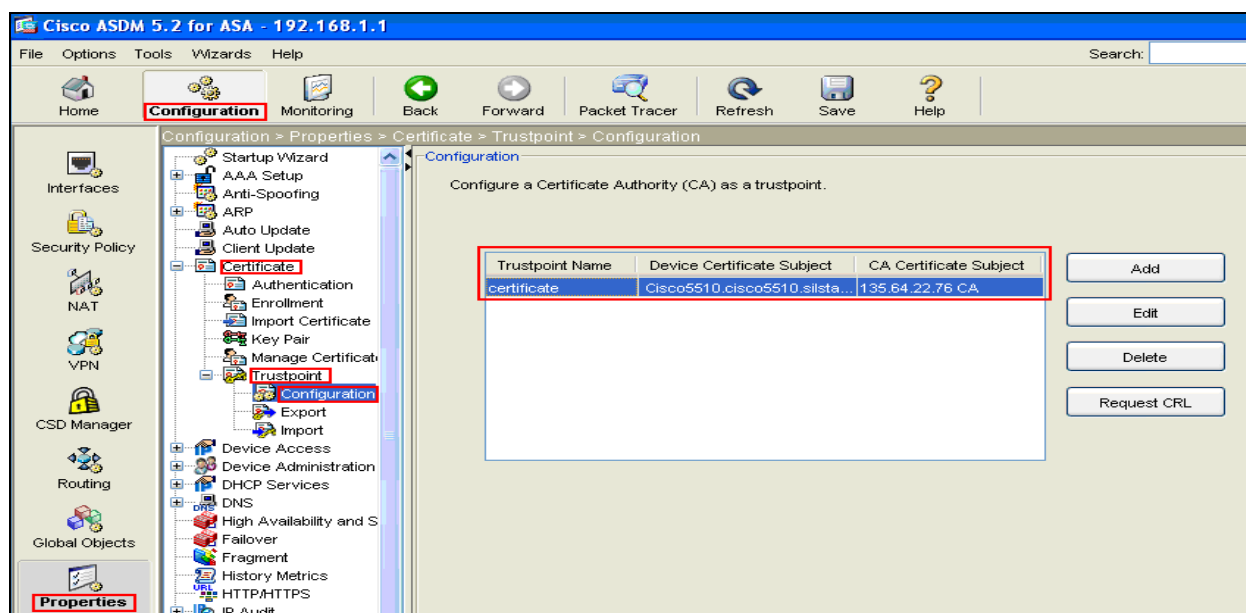

Default Server: Default Port:

☐ Enable HTTP

☒ **Enable Simple Certificate Enrollment Protocol (SCEP)**

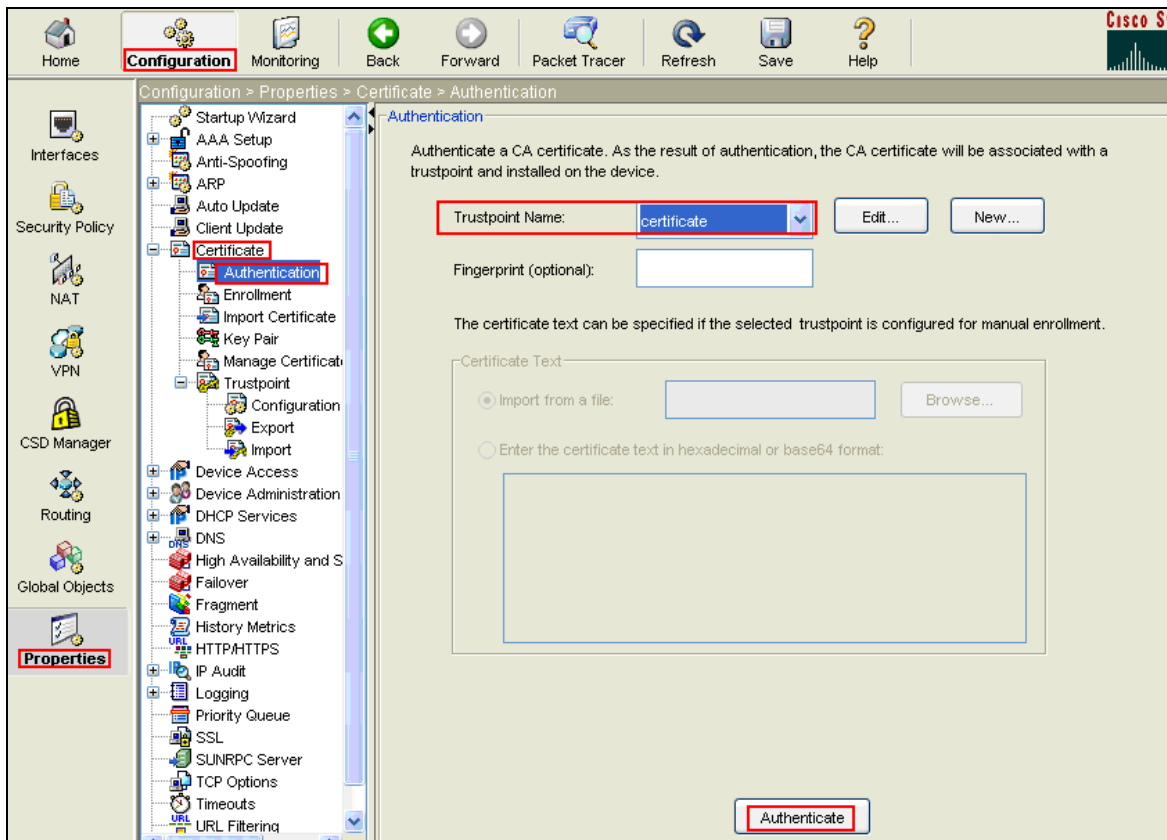

OK Cancel Help

The following screenshot is displayed.

4.5. Authenticate the TrustPoint

To authenticate the Trustpoint, select **Configuration, Properties, Certificate** then **Authentication**. Select the **Trustpoint Name** as **certificate** which was created in **Section 4.4** and click **Authenticate**.

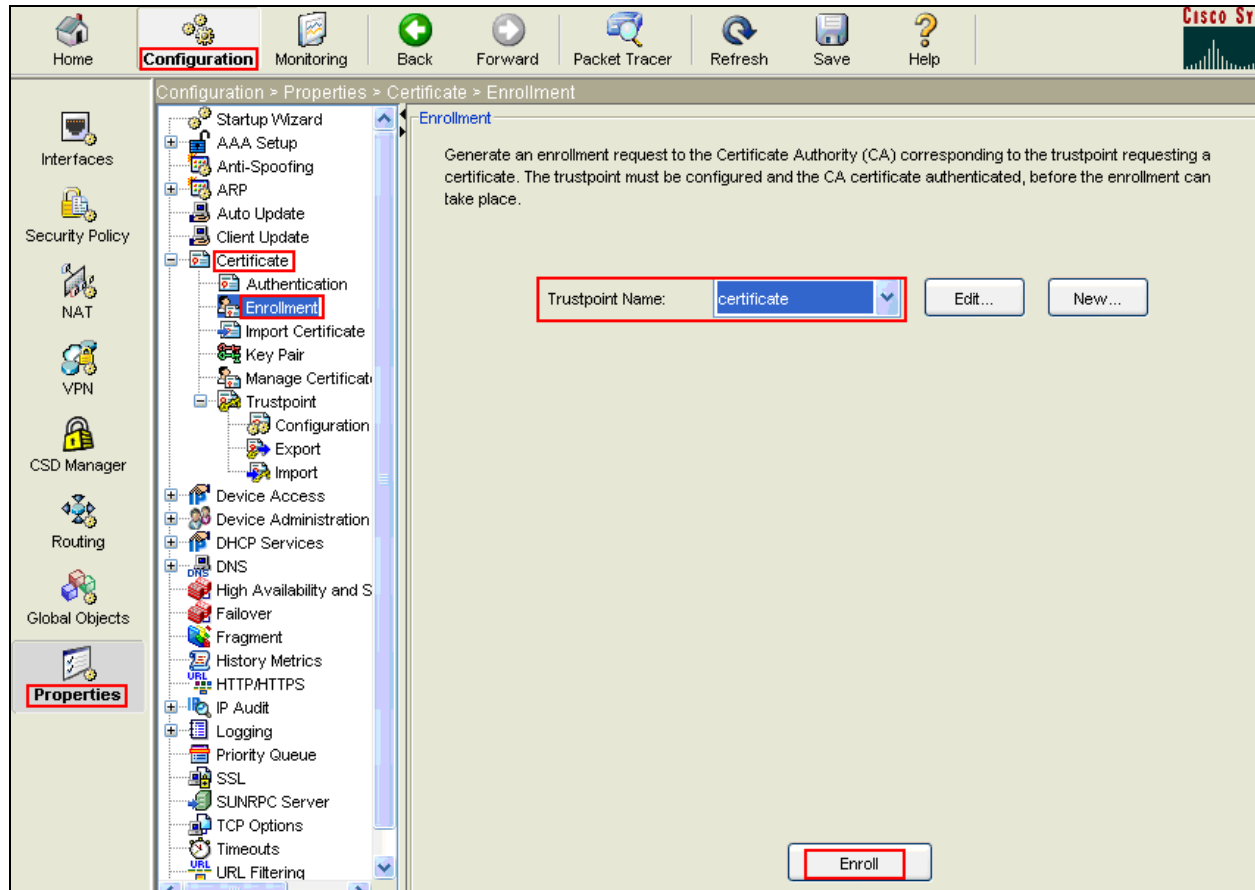

The following screenshot is displayed stating the authentication of the Trustpoint named **certificate** was successful.

4.6. Enroll a Trustpoint with Microsoft CA

To enroll a Trustpoint, select **Configuration, Properties, Certificate** then **Enrollment**. Select the **Trustpoint Name** as **certificate** which was created in **Section 4.4**. Press the **Enroll** button.

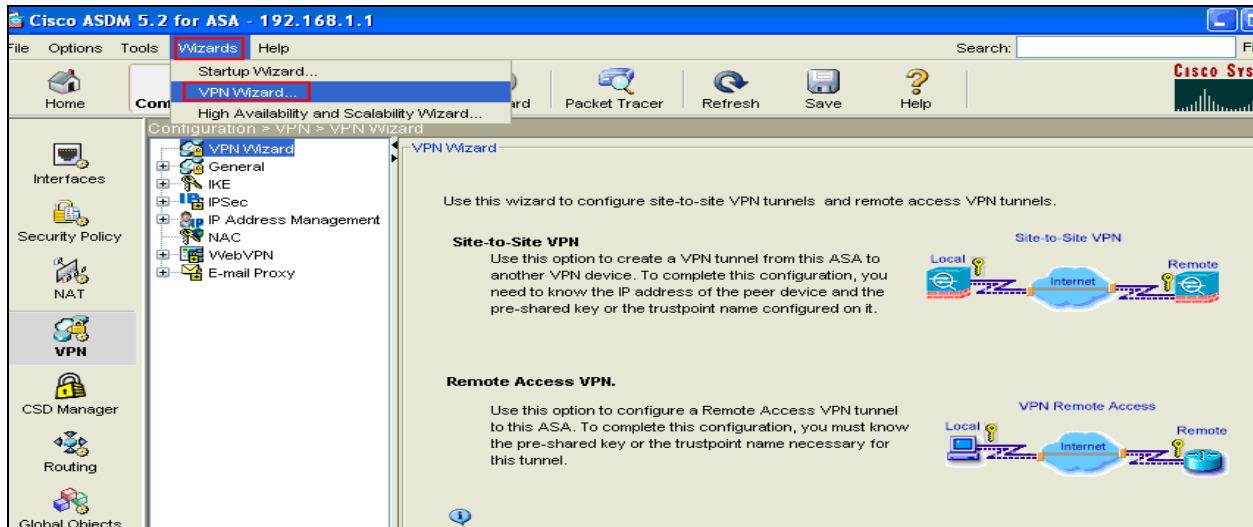

The following screenshot is displayed stating enrollment has been sent to CA.

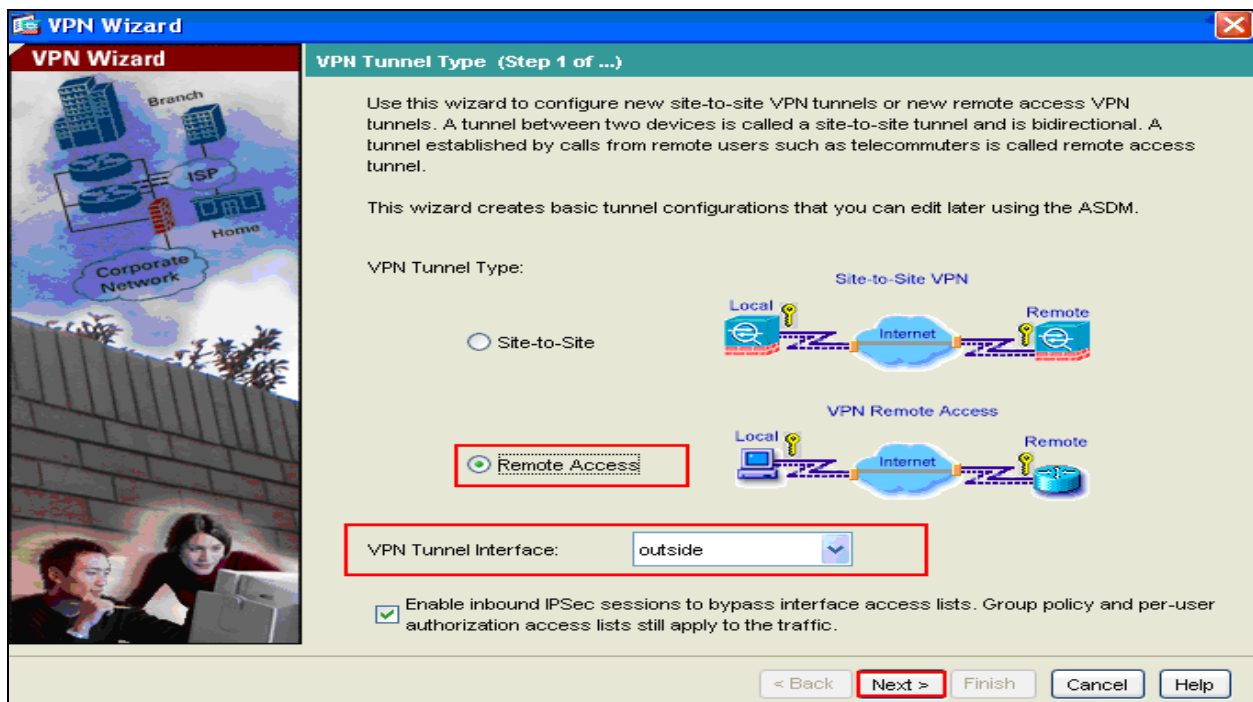

4.7. Create IPsec VPN Tunnel

This section describes the steps to create the IPsec VPN and VPN user accounts using the Adaptive Security Device Manager VPN Wizard of the Adaptive Security Device Manager application. The user accounts are created in the user authentication database local to the Cisco 5510 Adaptive Security Appliance. Access the **Wizards** heading and sub heading **VPN Wizard**.

The following screenshot is displayed. Select **Remote Access** and set the **VPN Tunnel Interface** to **outside**. Press the **Next** button.

Set **VPN Client type** to **Cisco VPN Client, Release 3.x or higher**. Press the **Next** button.

VPN Wizard

Remote Access Client (Step 2 of ...)

Remote access users of various types can open VPN tunnels to this ASA. Select the type of VPN client for this tunnel.

VPN Client Type:

☒ **Cisco VPN Client, Release 3.x or higher**
or other Easy VPN Remote product

☐ Microsoft Windows client using L2TP over IPSec

Specify the PPP authentication protocol. If a protocol is not specified on the remote client, do not specify it.

☐ PAP ☒ CHAP ☒ MS-CHAP-V1 ☐ MS-CHAP-V2 ☐ EAP-PROXY

Specify if the client will send tunnel group name as - username@tunnelgroup.

☐ Client will send tunnel group name as username@tunnelgroup.

If pre-shared authentication is used with this option then DefaultRAGroup's pre-shared key and ppp authentication are also modified.

< Back **Next >** Finish Cancel Help

Set the **Authentication Method** to **Certificate** and select from the drop down menu the **Trustpoint Name** named **certificate** created in **Section 4.4**. It was decided to set the **Tunnel Group Name** to **vpnphone**. Press the **Next** button.

VPN Wizard

VPN Client Authentication Method and Tunnel Group Name (Step 3 of ...)

The ASA allows you to group remote access tunnel users based on common connection parameters and client attributes configured in the subsequent screens. Configure authentication method and tunnel group for this remote connection. Use the same tunnel group name for the device and the remote client.

Authentication Method

☐ Pre-shared key
Pre-Shared Key:

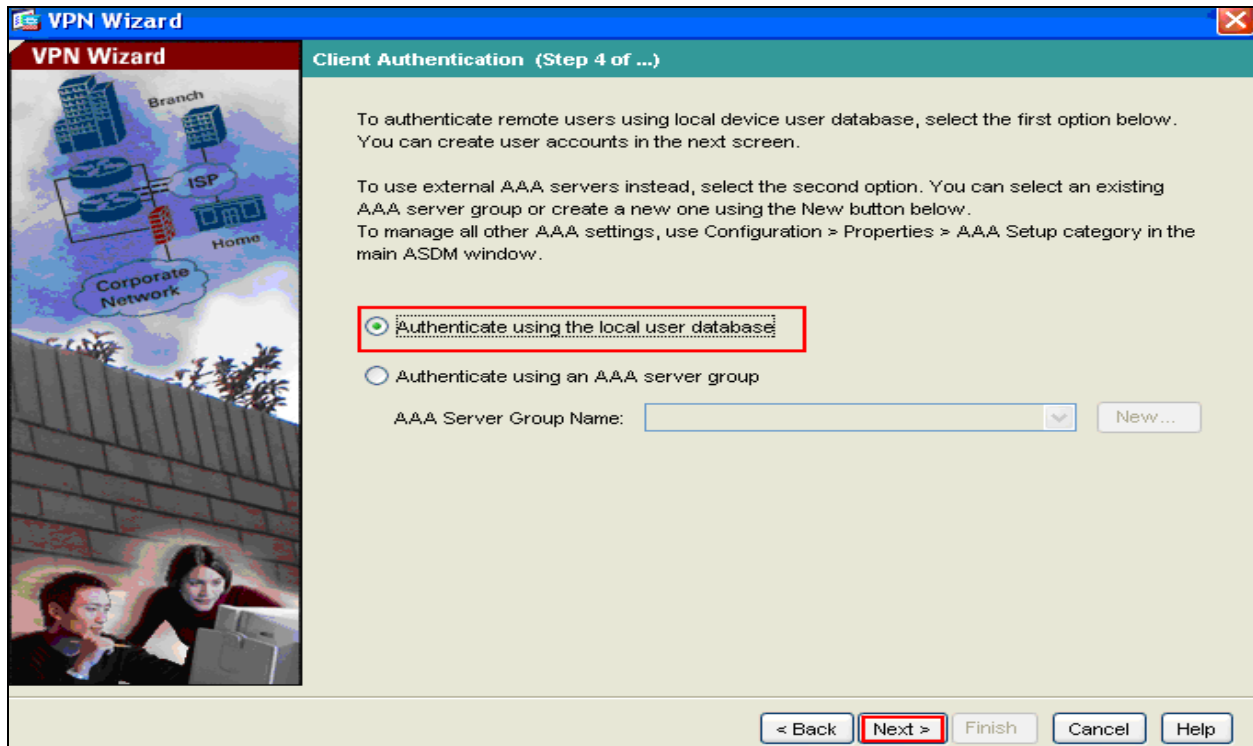

☒ **Certificate**
Certificate Signing Algorithm: rsa-sig
Trustpoint Name: **certificate**

☐ Challenge/response authentication (CRACK)

Tunnel Group
Tunnel Group Name: **vpnphone**

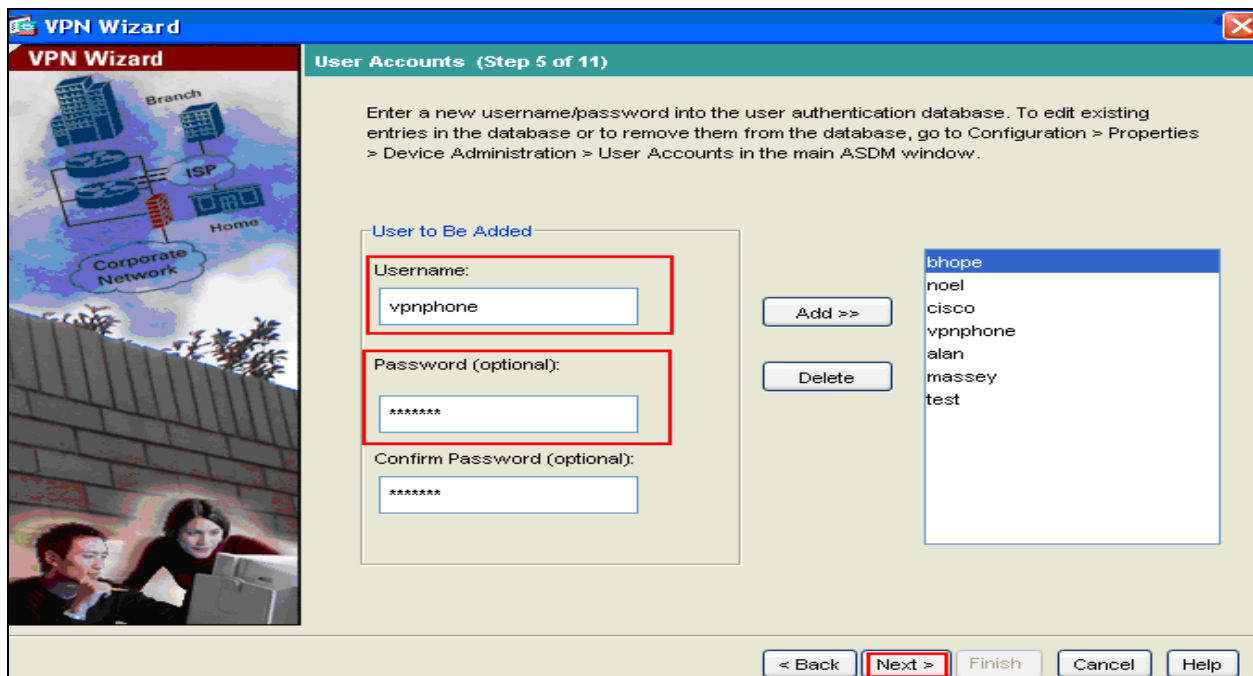

< Back **Next >** Finish Cancel Help

Select **Authenticate using the local user database**. Press the **Next** button.

The screenshot shows the 'VPN Wizard' window, 'Client Authentication (Step 4 of 11)'. The left sidebar contains a network diagram with 'Branch', 'ISP', 'Corporate Network', and 'Home' components, and an image of two people at a computer. The main area has instructional text: 'To authenticate remote users using local device user database, select the first option below. You can create user accounts in the next screen.' and 'To use external AAA servers instead, select the second option. You can select an existing AAA server group or create a new one using the New button below. To manage all other AAA settings, use Configuration > Properties > AAA Setup category in the main ASDM window.' There are two radio buttons: 'Authenticate using the local user database' (selected and highlighted with a red box) and 'Authenticate using an AAA server group'. Below the second option is a text field for 'AAA Server Group Name:' and a 'New...' button. At the bottom are buttons: '< Back', 'Next >' (highlighted with a red box), 'Finish', 'Cancel', and 'Help'.

Enter **vpnphone** as the **Username** and an appropriate **Password**. Press the **Next** button.

The screenshot shows the 'VPN Wizard' window, 'User Accounts (Step 5 of 11)'. The left sidebar is identical to the previous screen. The main area has instructional text: 'Enter a new username/password into the user authentication database. To edit existing entries in the database or to remove them from the database, go to Configuration > Properties > Device Administration > User Accounts in the main ASDM window.' There is a 'User to Be Added' section with three fields: 'Username:' (containing 'vpnphone' and highlighted with a red box), 'Password (optional):' (containing '*****' and highlighted with a red box), and 'Confirm Password (optional):' (containing '*****'). To the right of these fields are 'Add >>' and 'Delete' buttons. Further right is a list box containing the following usernames: 'bhope', 'noel', 'cisco', 'vpnphone', 'alan', 'massey', and 'test'. At the bottom are buttons: '< Back', 'Next >' (highlighted with a red box), 'Finish', 'Cancel', and 'Help'.

Select the **New** button to create a new pool of local IP Addresses. It was decided to set the IP Address pool range name as **vpnphone-ip-pool**. Set the IP Address pool range from **10.10.25.40 to 10.10.25.80**. This is the range of IP addresses the VPN telephone will take its IP Address from. Press the **Next** button.

The screenshot shows the 'VPN Wizard' window at 'Step 6 of 11', titled 'Address Pool'. The left sidebar contains a network diagram with labels for 'Branch', 'ISP', 'Home', and 'Corporate Network', along with an image of two people at a computer. The main area contains the following configuration options:

- Tunnel Group Name : vpnphone
- Pool Name: A dropdown menu showing 'vpnphone-ip-pool' with a 'New ...' button to its right.
- Pool Settings (highlighted in a red box):
 - Range Start Address: 10.10.25.40
 - Range End Address: 10.10.25.80
 - Subnet Mask: 255.255.255.0

At the bottom, there are five buttons: '< Back', 'Next >' (highlighted with a red box), 'Finish', 'Cancel', and 'Help'.

No values were needed for DNS Server or WNS Server. Press the **Next** button.

VPN Wizard

VPN Wizard

Attributes Pushed to Client (Optional) (Step 7 of 11)

Attributes you configure below are pushed to the VPN client when the client connects to the ASA. If you do not want an attribute pushed to the client, leave the corresponding field blank.

Tunnel Group: vpnphone

Primary DNS Server:

Secondary DNS Server:

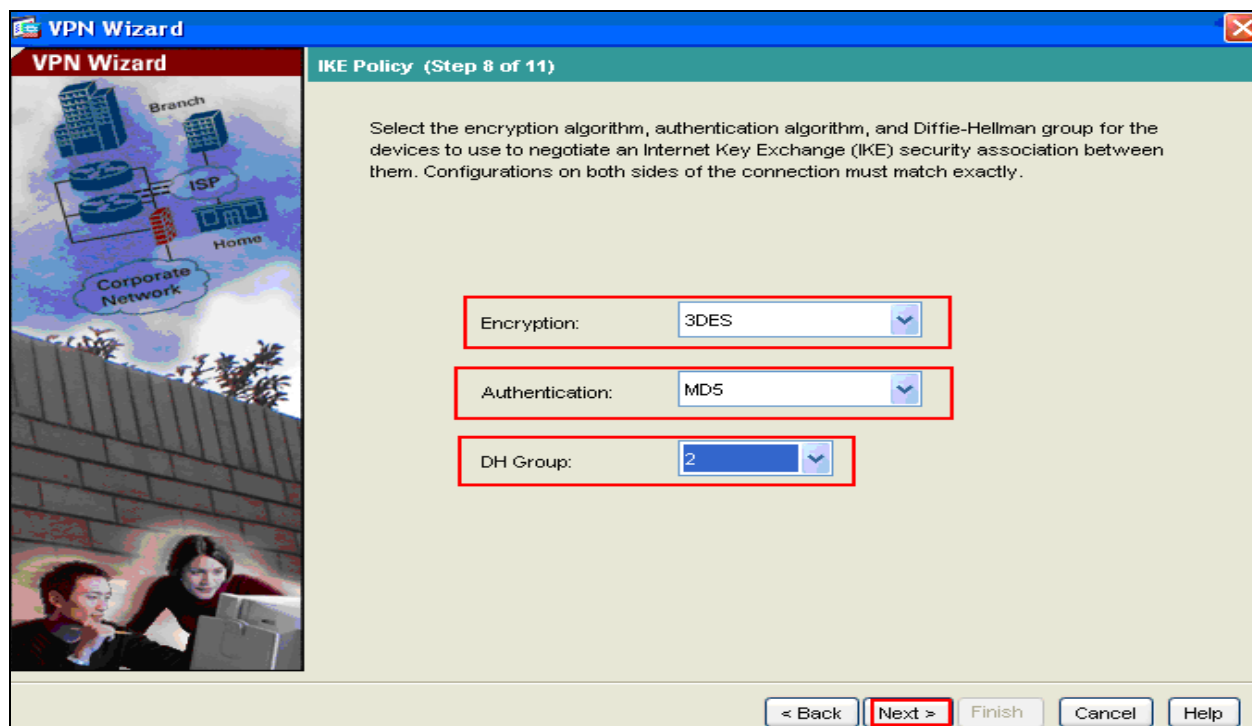

Primary WINS Server:

Secondary WINS Server:

Default Domain Name:

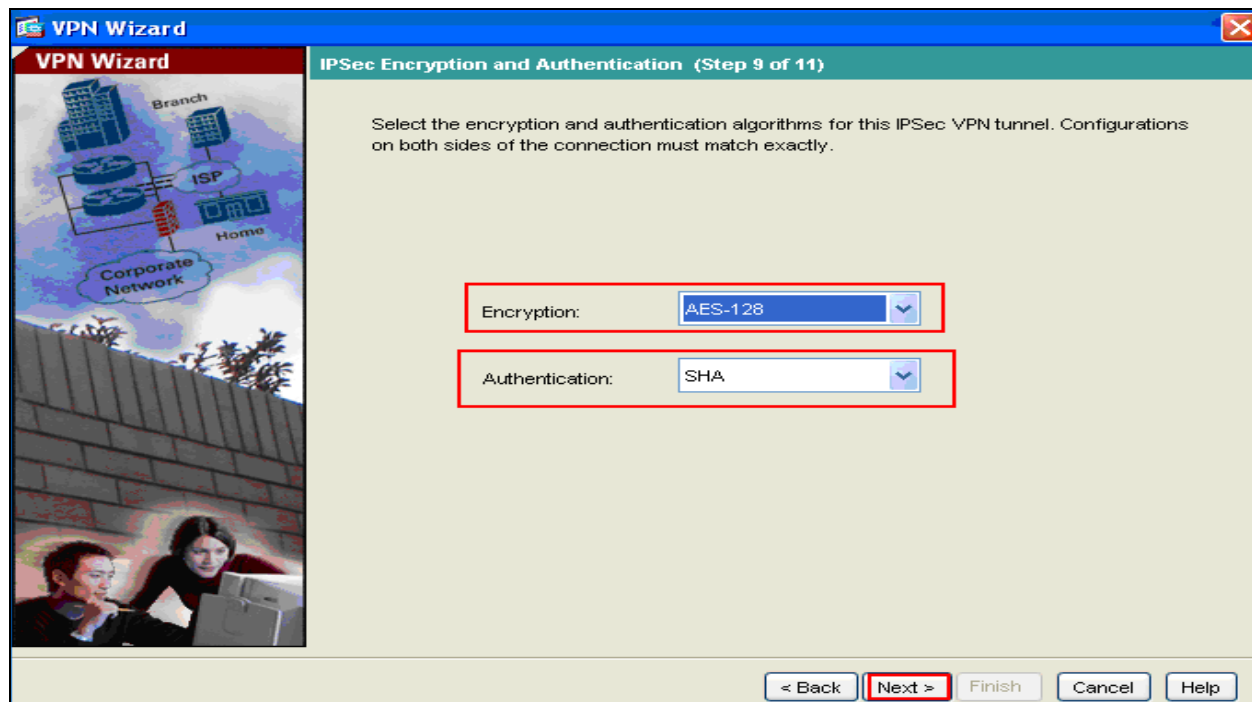

< Back **Next >** Finish Cancel Help

Set the IKE **Encryption** to **3DES**, set the IKE **Authentication** to **MD5** and set the **DH Group** to **2**. Press the **Next** button.

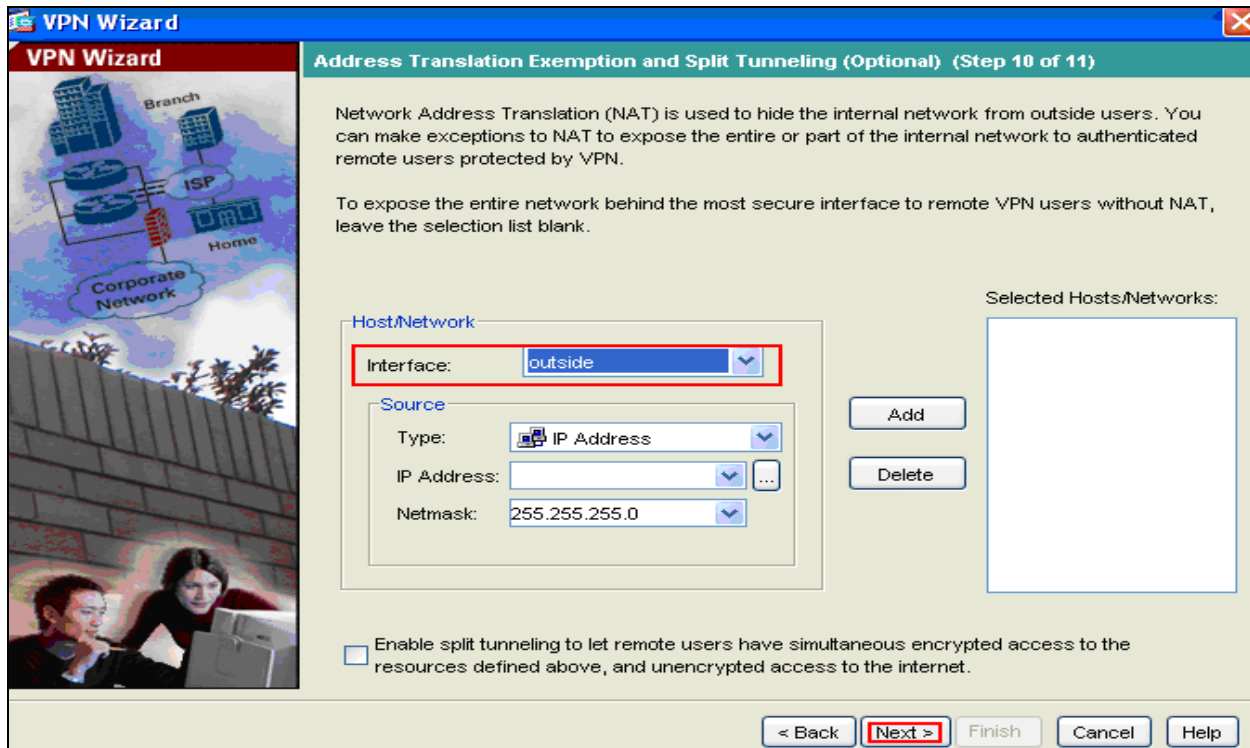

The screenshot shows the 'VPN Wizard' window at 'IKE Policy (Step 8 of 11)'. The left sidebar contains a network diagram with 'Branch', 'ISP', 'Home', and 'Corporate Network' components, and an image of two people at a computer. The main area has a title bar 'IKE Policy (Step 8 of 11)' and a text block: 'Select the encryption algorithm, authentication algorithm, and Diffie-Hellman group for the devices to use to negotiate an Internet Key Exchange (IKE) security association between them. Configurations on both sides of the connection must match exactly.' Below this are three dropdown menus: 'Encryption:' set to '3DES', 'Authentication:' set to 'MD5', and 'DH Group:' set to '2'. At the bottom are buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'. The 'Next >' button is highlighted with a red box.

Set the IPSec **Encryption** to **AES-120** and IPSec **Authentication** to **SHA**. Press the **Next** button.

The screenshot shows the 'VPN Wizard' window at 'IPSec Encryption and Authentication (Step 9 of 11)'. The left sidebar is identical to the previous step. The main area has a title bar 'IPSec Encryption and Authentication (Step 9 of 11)' and a text block: 'Select the encryption and authentication algorithms for this IPSec VPN tunnel. Configurations on both sides of the connection must match exactly.' Below this are two dropdown menus: 'Encryption:' set to 'AES-128' and 'Authentication:' set to 'SHA'. At the bottom are buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'. The 'Next >' button is highlighted with a red box.

Set the **Interface** to **outside**. All other fields are not required. Press the **Next** button.

The screenshot shows the 'VPN Wizard' window at Step 10 of 11, titled 'Address Translation Exemption and Split Tunneling (Optional)'. The left sidebar contains a diagram of a network topology with 'Branch', 'ISP', 'Home', and 'Corporate Network' components. The main area contains text explaining NAT and instructions on how to expose the internal network. Below this, there is a 'Host/Network' section with a red box around the 'Interface' dropdown menu, which is set to 'outside'. The 'Source' section has 'Type' set to 'IP Address', 'IP Address' set to '255.255.255.0', and 'Netmask' set to '255.255.255.0'. To the right is a 'Selected Hosts/Networks' list with 'Add' and 'Delete' buttons. At the bottom, there is a checkbox for 'Enable split tunneling' and a row of navigation buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'. The 'Next >' button is highlighted with a red box.

VPN Wizard

VPN Wizard

Address Translation Exemption and Split Tunneling (Optional) (Step 10 of 11)

Network Address Translation (NAT) is used to hide the internal network from outside users. You can make exceptions to NAT to expose the entire or part of the internal network to authenticated remote users protected by VPN.

To expose the entire network behind the most secure interface to remote VPN users without NAT, leave the selection list blank.

Host/Network

Interface: **outside**

Source

Type: **IP Address**

IP Address: **255.255.255.0**

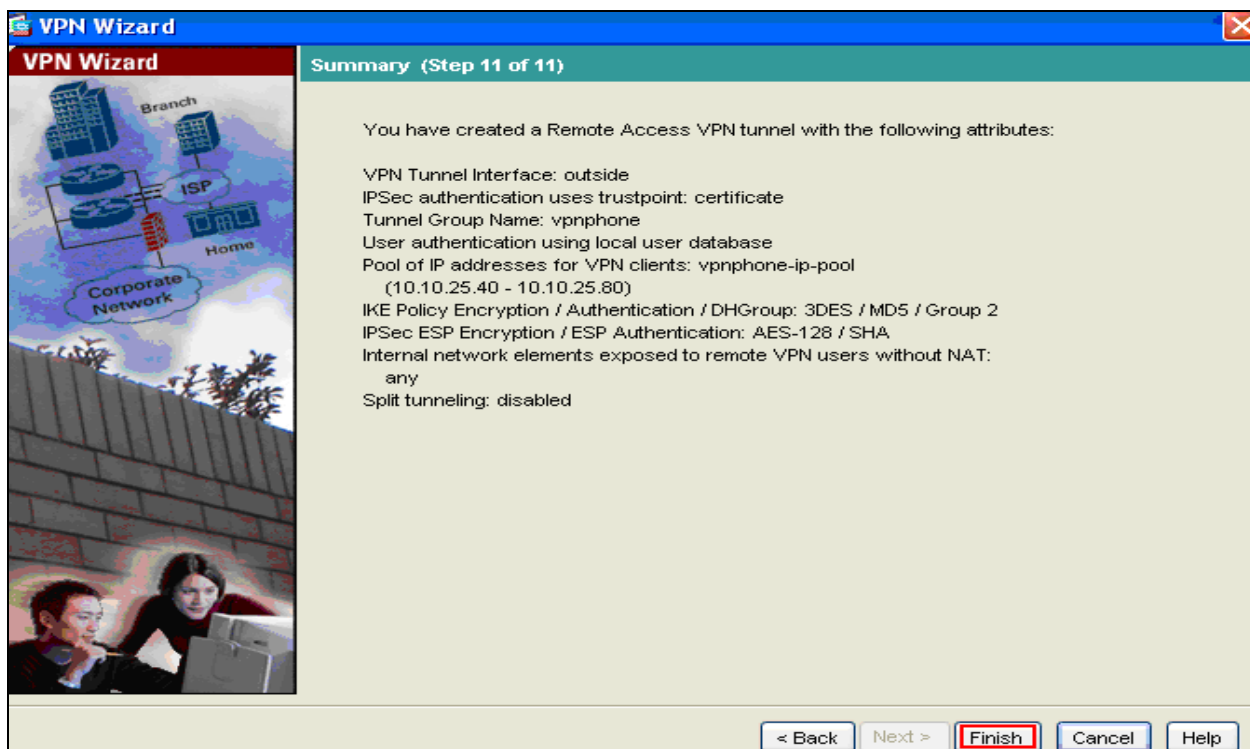

Netmask: **255.255.255.0**

Selected Hosts/Networks:

☐ Enable split tunneling to let remote users have simultaneous encrypted access to the resources defined above, and unencrypted access to the internet.

Press the **Finish** button.

The screenshot shows the 'VPN Wizard' window at Step 11 of 11, titled 'Summary'. The left sidebar contains the same network topology diagram as in Step 10. The main area displays a summary of the VPN configuration attributes. At the bottom, there is a row of navigation buttons: '< Back', 'Next >', 'Finish', 'Cancel', and 'Help'. The 'Finish' button is highlighted with a red box.

VPN Wizard

VPN Wizard

Summary (Step 11 of 11)

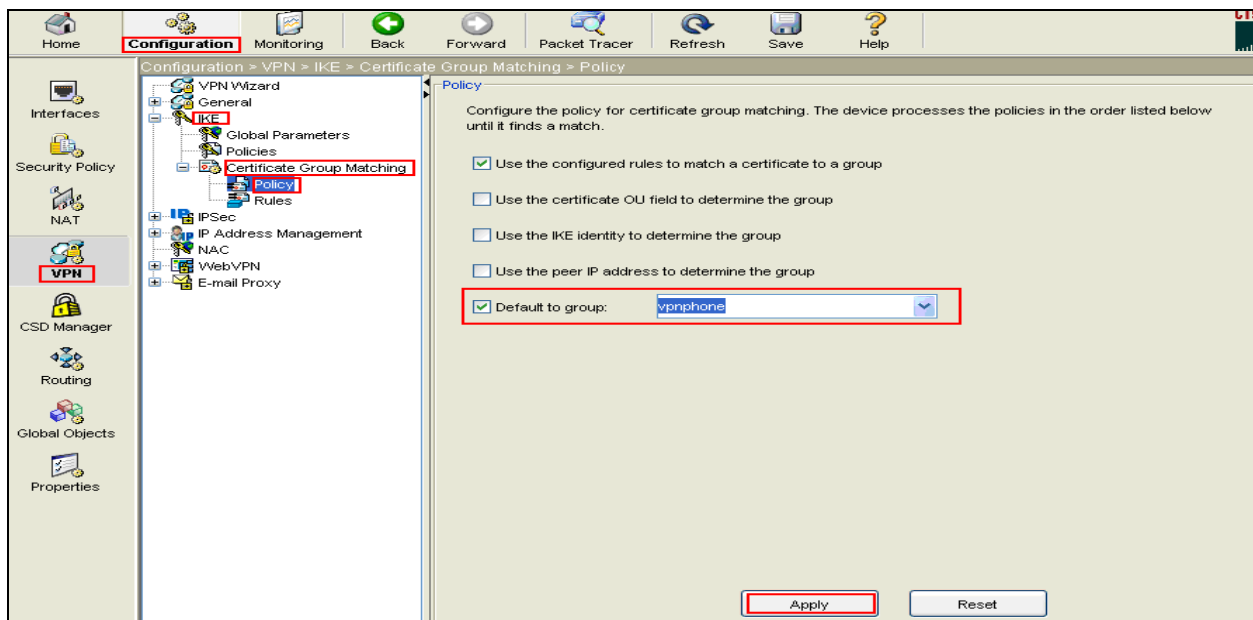

You have created a Remote Access VPN tunnel with the following attributes:

- VPN Tunnel Interface: outside
- IPSec authentication uses trustpoint: certificate
- Tunnel Group Name: vpnphone
- User authentication using local user database
- Pool of IP addresses for VPN clients: vpnphone-ip-pool (10.10.25.40 - 10.10.25.80)
- IKE Policy Encryption / Authentication / DHGroup: 3DES / MD5 / Group 2
- IPSec ESP Encryption / ESP Authentication: AES-128 / SHA
- Internal network elements exposed to remote VPN users without NAT: any
- Split tunneling: disabled

< Back Next > **Finish** Cancel Help

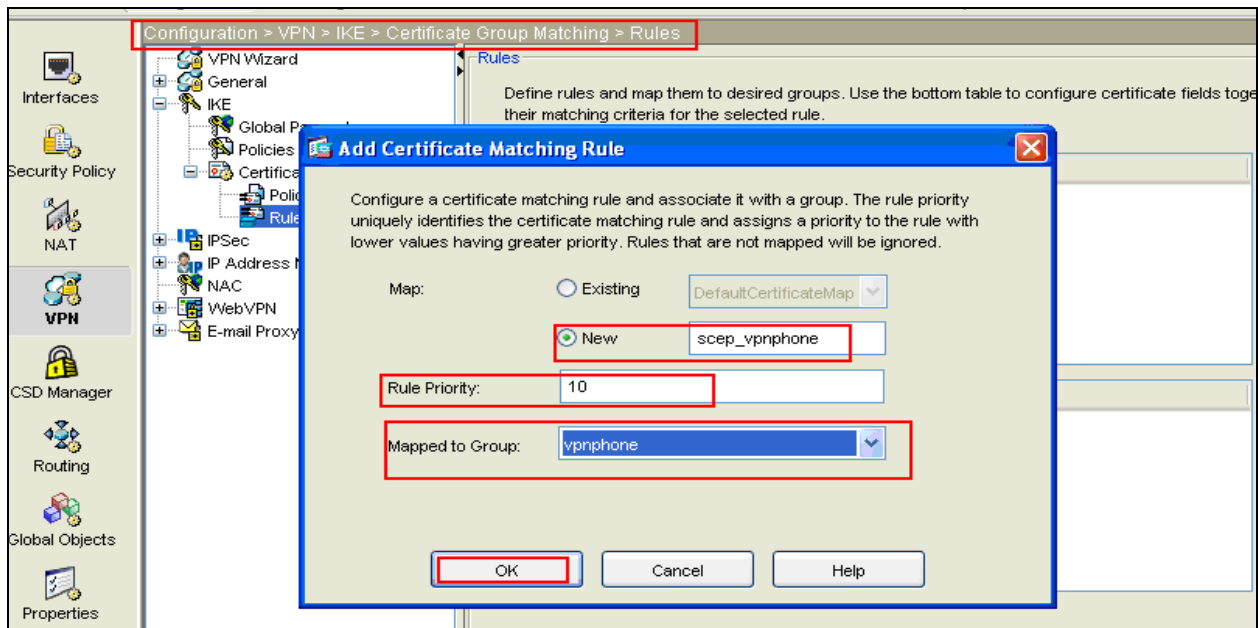

4.8. Create VPN Policy

For an added layer of security when using certificate based authentication, the Certificate Group Matching feature of the Cisco 5510 Adaptive Security Appliance can be used with Avaya VPN telephones. Certificate Group Matching allows a rule to be created to match an Avaya VPN telephone certificate based on fields of the certificate. The rule created in the sample configuration requires the Common Name attribute of the certificate to contain a specified string value. The string value used is the first three octets of the MAC address of the Avaya 9600 Series IP Telephone, 00-04-0d. These first three octets of a MAC address are designated as the Organizationally Unique Identifier and common across all 9600 Series IP Telephones. This rule verifies that the device the certificate is associated with is an Avaya Telephone. To populate the Common Name attribute of the certificate with the MAC address of the Avaya VPN telephone, the variable MYCERTCN must be set to \$MACADDR in the 46xxsetting.txt file. Select **Configuration, VPN, IKE, Certificate Group Matching** and select **vpnphone** as the **Default to group** as created in **Section 4.7**. Press the **Apply** button.

4.9. Create VPN Rule

To create a new VPN Rule, select **Add** (not shown) and enter the **New** rule name **SCEP_vpnphone**. Set the **Rule Priority** to **10**. Set **Mapped to Group** to **vpnphone**, the vpn tunnel group name created in **Section 4.7**. Press the **OK** button.

In the subsequent screen set the first three octets of the MAC address of the 9600 IP telephone.

5. 46xxSettings File

The 46xxsetting.txt file contains Virtual Private Network specific variables for the Avaya 9600 IP telephone to use during the setup of the IPSec VPN tunnel. Variables specific to digital certificate authentication and the Cisco 5510 Adaptive Security Appliance are listed below. Descriptions of each variable and the values used in the sample configuration are shown.

SET NVVPNMODE 1

This variable dictates when the VPN Client is started. If it's value is 1, VPN Client is started immediately after TCP/IP stack is initialized, If it's value is 0, VPN Client is disabled

SET NVVPNSVENDOR 2

Specifies the security gateway Vendor to be used.

1 = Juniper PSK with Authentication or Juniper Certificate with Authentication

2 = Cisco PSK with Authentication or **Cisco Certificate with Authentication**

3 = Checkpoint Security Gateway

4 = Generic PSK

5 = Nortel Contivity

SET NVVPNENCAPS 0

Specifies type of UDP encapsulation method to use if there is a NAT device between phone and the security gateway. By default UDP Encapsulation 4500-4500 is used.

SET NVVPNCOPYTOS 2

The value of this variable decides whether TOS bits should be copied from inner header to outer header or not. If it's value is 1, TOS bits are copied otherwise not. By default TOS bits are not copied from inner header to outer header. Some Internet Service Provider don't route the IP packets properly if TOS bits are set to anything other than 0.

SET NVVPNAUTHTYPE 5

RSA Signature with Authentication

3 = PSK

4 = PSK with Authentication

5 = RSA Signature with Authentication

6 = Hybrid Authentication

7 = RSA Signature

SET NVVPNUSERTYPE 1

Specifies whether the user can change the VPN username.

SET NVVPNUSER "vpnuser"

This variable contains the VPN User Name. In most cases this value will be unique to each phone hence should not be specified here. However it is possible to force the VPN client in the phone to use phone's mac address or serial number as user name thus eliminating the need to

enter user name by the phone user via phone keypad. In such cases you need to add each phone's serial number or mac address in your authentication

SET NVVPNPSWDTYPE 1

This variable determines how password should be treated. By default, password type is set to 1. You must set this variable to 3 or 4 if using One Time Password such as SecureID from RSA.

SET NVIKEID “vpnphone”

Phone uses this string as IKE Identifier during phase 1 negotiation. Some XAuth documentation refers to this variable as group name because the same IKE Id is shared among a group of users. Individual user authentication is done using XAuth after establishing IKE phase 1 security association.

SET NVIKEIDTYPE 11

Phone uses this variable as the IKE Identifier type for the IKE-ID specified via NVIKEID variable.

SET NVVPNCFGPROF 8

For Cisco authentication with certificates choose option number 8.

The following variables are set to specified value when **NVVPNCFGPROF** is set to **8**

NVIKECONFIGMODE 1

NVIKEIDTYPE 11

NVIKEXCHGMODE 1

SET NVIKEDHGRP 2

This variable contains the value of the DH group to use during phase 1 negotiation. By default phone uses Group 2.

SET NVIKEP1ENCALG 2

Security Gateway picks the algorithm mandated by administrator.

0 ANY

1 AES-128

2 3DES

3 DES

4 AES-192

5 AES-256

SET NVIKEP1AUTHALG 0

0 ANY

1 MD5

2 SHA1

SET NVPFSDHGRP 2

This variable contains the value of DH group to use during phase 2 negotiation for establishing IPsec security associations also known as perfect forward secrecy. By default PFS is disabled.

SET NVIKEP2AUTHALG 0**0 ANY**

1 MD5

2 SHA1

SET NVIKEOVERTCP 0

Specifies whether and when to use TCP as a transport protocol for IKE.

SET MCIPADD 135.64.186.81

The Call Server Addresses which is the processor IP Address of the MBT.

SET TRUSTCERTS "46vpn_cert.cer"

List of trusted certificates to download to phone. This parameter may contain one or more certificate filenames, separated by commas without any intervening spaces. Files may contain only PEM-formatted certificates.

SET MYCERTWAIT 1

Specifies whether the telephone will wait until a pending certificate request is complete, or whether it will periodically check in the background.

SET MYCERTURL http://135.64.186.207/certsrv/mscep/mscep.dll

URI used to access SCEP server.

SET MYCERTCN \$MACADDR

Common Name specified for SUBJECT of SCEP certificate request.

SET SCEPPASSWORD "9B5F04D7D3FCEBFD "

The string specified here is used by phone as the SCEP challenge pass phrase for SCEP certificate enrollment. If left unspecified and SCEPPASSWORDREQ is SET to 0, phone uses it's SERIAL number as the challenge pass phrase.

6. Administer Avaya Aura™ Communication Manager

This section highlights the important commands for registering the Avaya 9600 IP telephone within Communication Manager and administering an IP network region and IP codecs to carry calls between Avaya IP endpoints.

6.1. Verify OPS Capacity

Use the **display system-parameters customer-options** command to verify that **Maximum Concurrently Registered IP Stations** has been set to the value that has been licensed, and that this value will accommodate addition of IP telephones. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya Sales representative to obtain additional capacity.

```
display system-parameters customer-options                               Page 2 of 11
                                OPTIONAL FEATURES

IP PORT CAPACITIES                                                    USED
      Maximum Administered H.323 Trunks: 8000 12
      Maximum Concurrently Registered IP Stations: 18000 5
      Maximum Administered Remote Office Trunks: 8000 0
Maximum Concurrently Registered Remote Office Stations: 18000 0
      Maximum Concurrently Registered IP eCons: 128 0
      Max Concur Registered Unauthenticated H.323 Stations: 100 0
      Maximum Video Capable Stations: 2400 0
      Maximum Video Capable IP Softphones: 100 3
      Maximum Administered SIP Trunks: 5000 80
Maximum Administered Ad-hoc Video Conferencing Ports: 8000 0
      Maximum Number of DS1 Boards with Echo Cancellation: 522 0
      Maximum TN2501 VAL Boards: 10 1
      Maximum Media Gateway VAL Sources: 250 0
      Maximum TN2602 Boards with 80 VoIP Channels: 128 0
      Maximum TN2602 Boards with 320 VoIP Channels: 128 0
      Maximum Number of Expanded Meet-me Conference Ports: 300 0
```

6.2. Administer Dial Plan Analysis

This section describes the **Dial Plan Analysis** screen. This is Communication Manager's way of translating digits dialed by the user. The user can determine the beginning digits and total length for each type of call that Communication Manager needs to interpret. The **Dialed String** beginning with the number **4** and with a **Total Length** of **5** digits will be used to administer the **extension** range used for the IP telephones.

display dialplan analysis							Page 1 of 12				
DIAL PLAN ANALYSIS TABLE											
Location: all							Percent Full: 0				
	Dialed String	Total Length	Call Type		Dialed String	Total Length	Call Type		Dialed String	Total Length	Call Type

5		5	ext								
6		5	ext								
7		5	aar								
8		5	aar								
9		1	fac								
*		3	dac								
#		3	dac								

6.3. Administer IP Node-Name

This section describes **IP Node-Name** form. This is where Communication Manager assigns the IP Address and node-name to the SIP Enablement Server. The node-name of the SIP Enablement Server is **ses1** and the IP Address of the SIP Enablement Server is **135.64.186.89** within Communication Manager. Communication Manager automatically populates a processor node name to the IP Address of Communication Manager. This node name is **procr** with IP Address **135.64.186.81**.

list node-names all		
NODE NAMES		
Type	Name	IP Address
IP	AES1	135.64.186.88
IP	CMM	135.64.186.82
IP	MedSvcsMedpro1	135.64.186.84
IP	MedSvcsMedpro2	135.64.186.85
IP	MedSvcsMedpro3	135.64.186.86
IP	MedSvcsMedpro4	135.64.186.87
IP	procr	135.64.186.81
IP	ses1	135.64.186.89

6.4. Administer IP Network Region

This section describes **IP Network Region** screen. The sample configuration places all IP endpoints in the one network region. The **Authoritative Domain** must mirror the domain name of the SIP Enablement Server. This was **silstack.com**. The codecs used on the IP endpoints were placed in **Codec Set 1**. IP Shuffling was turned on so both **Intra-region IP-IP Direct Audio** and **Inter-region IP-IP Direct Audio** were set to **yes**.

```
display ip-network-region 1                                     Page 1 of 19

                                IP NETWORK REGION

Region: 1
Location: 1      Authoritative Domain: silstack.com
Name:
MEDIA PARAMETERS                                Intra-region IP-IP Direct Audio: yes

H.323 Link Bounce Recovery? y
Idle Traffic Interval (sec): 20
Keep-Alive Interval (sec): 5
      Keep-Alive Count: 5
```

6.5. Administer IP Codec Set

This section describes the **IP Codec Set** screen. It was decided to use IP Codecs **G.711MU**, **G.711A** and **G.729** for testing purposes with the IP endpoints.

```
display ip-codec-set 1                                         Page 1 of 2

                                IP Codec Set

      Codec Set: 1

      Audio      Silence      Frames      Packet
      Codec      Suppression  Per Pkt   Size(ms)
1: G.711MU      n            2        20
2: G.711A      n            2        20
3: G.729      n            2        20
4:
```

6.6. Administer Station Screen

This screen describes the **station** form setup for the IP telephone in Communication Manager as shown. The **Extension** used was **40125** with phone **Type 9630**. The **Name** of the phone was set to **VPN test** and the **IP SoftPhone** parameter was set to **yes**. All other values on **Page 1** of the station form were left as default.

```

display station 40125

```

			Page 1 of 5
STATION

Survivable COR: internal	Media Complex Ext:		
Survivable Trunk Dest? y	IP SoftPhone? y		
	IP Video? n		

7. Verification Steps

The following verification steps were tested using the sample configuration.

From Communication Manager, verify the IP telephones registered to Communication Manager as shown below.

```

list registered-ip-stations

```

REGISTERED IP STATIONS					
Station Ext or Orig Port	Set Type/ Net Rgn	Prod ID/ Release	TCP Skt	Station IP Address/ Gatekeeper IP Address	
40020	9640	IP_Phone	y	10.10.99.11	
	1	3.1000		135.64.186.81	
40125	9640	IP_Phone	y	10.10.25.40	
	1	3.1000		135.64.186.81	
40126	9630	IP_Phone	y	10.10.25.41	
	1	3.1000		135.64.186.81	

Verify calls can be made with clear audio from the Avaya VPN telephone to a second VPN telephone. The VPN telephone extension 40125 registered with IP Address 10.10.25.40 and VPN telephone extension 40126 registered with IP Address 10.10.25.41. Verify the calls are seen to be active within Communication Manager. Verify supplementary features such as Call Hold, Call Forward, Conference and Transfer can be completed between the Avaya endpoints.

8. Conclusion

These Application Notes describe the administration steps required to configure an Avaya 9600 IP Telephone VPN feature for Certificate Authentication using Cisco Adaptive Appliance and Microsoft Certificate Authority with Avaya Aura™ Communication Manager and Avaya Aura™ SIP Enablement Services running on Avaya Aura™ Midsize Enterprise Single Server.
