

Avaya Solution & Interoperability Test Lab

Applications Notes for Avaya Aura™ Communication Manager 6.0, Avaya Aura™ Session Manager 6.0 and Avaya Aura™ Session Border Controller with AT&T IP Toll Free SIP Trunk Service – Issue 1.1

Abstract

These Application Notes describe the steps for configuring Avaya Aura™ Session Manager, Avaya Aura™ Communication Manager, and the Avaya Aura™ Session Border Controller with the AT&T IP Toll Free service using MIS/PNT transport connection.

Avaya Aura™ Session Manager 6.0 is a core SIP routing and integration engine that connects disparate SIP devices and applications within an enterprise. Avaya Aura™ Communication Manager 6.0 is a telephony application server and is the point of connection between the enterprise endpoints and Avaya Aura™ Session Manager. An Avaya Aura™ Session Border Controller is the point of connection between Avaya Aura™ Session Manager and the AT&T IP Toll Free service and is used not only to secure the SIP trunk, but also to make adjustments to the signaling for interoperability.

The AT&T IP Toll Free service is a managed Voice over IP (VoIP) communications solution that provides toll-free services over SIP trunks. Note that these Application Notes do NOT cover the AT&T IP Transfer Connect service option of the AT&T IP Toll Free service. Interaction of Avaya Aura™ Session Manager and Avaya Aura™ Communication Manager with the AT&T IP Transfer Connect service option will be addressed in separate Application Notes.

AT&T is a member of the Avaya DevConnect Service Provider program. Information in these Application Notes has been obtained through compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program.

1. Introduction

These Application Notes describe the steps for configuring Avaya Aura™ Session Manager, Avaya Aura™ Communication Manager, and Avaya Aura™ Session Border Controller (SBC) with the AT&T IP Toll Free service using MIS/PNT transport connection.

Avaya Aura™ Session Manager 6.0 is a core SIP routing and integration engine that connects disparate SIP devices and applications within an enterprise. Avaya Aura™ Communication Manager 6.0 is a telephony application server and is the point of connection between the enterprise endpoints and Avaya Aura™ Session Manager. An Avaya Aura™ Session Border Controller (SBC) is the point of connection between Avaya Aura™ Session Manager and the AT&T IP Toll Free service and is used not only to secure the SIP trunk, but also to make adjustments to the signaling for interoperability.

The AT&T IP Toll Free service is a managed Voice over IP (VoIP) communications solution that provides toll-free services over SIP trunks utilizing MIS/PNT¹ transport. **Note that these Application Notes do NOT cover the AT&T IP Transfer Connect service option of the AT&T IP Toll Free service.** Interaction of Avaya Aura™ Session Manager and Avaya Aura™ Communication Manager with the AT&T IP Transfer Connect service option will be addressed in separate Application Notes.

1.1. Interoperability Compliance Testing

The interoperability compliance testing focused on verifying inbound IP Toll Free call flows (see **Section 2.2** for examples) between Avaya Aura™ Session Manager, Avaya Aura™ Communication Manager, Avaya Aura™ Session Border Controller, and the AT&T IP Toll Free service.

The compliance testing was based on a test plan provided by AT&T, for the functionality required for certification as a solution supported on the AT&T network. Calls were made to and from the PSTN across the AT&T network (see **Section 2.2** for sample call flows). The following features were tested as part of this effort:

- SIP trunking
- T.38 Fax
- Passing of DTMF events and their recognition by navigating automated voice menus
- PBX and AT&T IP Toll Free service features such as hold, resume, conference and transfer
- Legacy Transfer Connect
- Alternate Destination Routing

¹ MIS/PNT does not support compressed RTP (cRTP).

1.2. Support

AT&T customers may obtain support for the AT&T IP Toll Free service by calling (888) 325-5555.

Avaya customers may obtain documentation and support for Avaya products by visiting <http://support.avaya.com>. In the United States, (866)GO-AVAYA (866-462-8292) provides access to overall sales and service support menus. Customers may also use specific numbers (provided on <http://support.avaya.com>) to directly access specific support and consultation services based upon their Avaya support agreements.

1.3. Known Limitations

1. If Avaya Aura™ Communication Manager receives an SDP offer with multiple codecs, where at least two of the codecs are supported in the codec set provisioned on Avaya Aura™ Communication Manager, then Avaya Aura™ Communication Manager selects a codec according to the priority order specified in its configured codec set, not the priority order specified in the SDP offer. For example, if the AT&T IP Toll Free service offers G.711, G.729A, and G.729B in that order, but the Avaya Aura™ Communication Manager codec set contains G.729B, G.729A, and G.711 in that order, then Avaya Aura™ Communication Manager selects G.729A, not G.711. The practical resolution is to provision the Avaya Aura™ Communication Manager codec set to match the expected codec priority order in AT&T IP Toll Free SDP offers.
2. G.726 codec is not supported between Avaya Aura™ Communication Manager and the AT&T IP Toll Free service.
3. G.711 faxing is not supported between Avaya Aura™ Communication Manager and the AT&T IP Toll Free service. Avaya Aura™ Communication Manager does not support the protocol negotiation that AT&T requires to have G.711 fax calls work. T.38 faxing is supported, as is Group 3 and Super Group 3 fax. Fax speeds are limited to 9600 bps in the configuration tested. In addition, Fax Error Correction Mode (ECM) is not supported by Avaya Aura™ Communication Manager.
4. Shuffling must be disabled on the SIP trunk between Avaya Aura™ Communication Manager and Avaya Aura™ Session Manager for calls local to the enterprise site due to codec negotiation issues with Avaya SIP telephones.

2. Reference Configuration

The reference configuration used in these Application Notes is shown in the figure below and consists of several components:

- Session Manager provides core SIP routing and integration services that enables communications between disparate SIP-enabled entities, e.g., PBXs, SIP proxies, gateways, adjuncts, trunks, applications, etc. across the enterprise. Session Manager allows enterprises to implement centralized and policy-based routing, centralized yet flexible dial plans, consolidated trunking, and centralized access to adjuncts and applications.
- System Manager provides a common administration interface for centralized management of all Session Manager instances in an enterprise.
- Communication Manager provides the voice communications services for a particular enterprise site. In this reference configuration, Communication Manager runs on an Avaya S8800 Server. This solution is extensible to other Avaya S8xxx Servers.
- The Avaya Media Gateway provides the physical interfaces and resources for Communication Manager. In the reference configuration, an Avaya G650 Media Gateway is used. This solution is extensible to other Avaya Media Gateways.
- Avaya “desk” phones are represented with Avaya 4600 and 9600 Series IP Telephones running H.323 software, 9600 Series IP Telephones running SIP software, Avaya 6211 series Analog Telephones, and Avaya one-X® Agent, a PC based Softphone.
- Session Border Controller provides SIP header manipulation between the AT&T IP Toll Free service and the enterprise internal network². UDP transport protocol is used between the Session Border Controller and the AT&T IP Toll Free service.
- An existing Avaya Modular Messaging system (in Multi-Site mode in this reference configuration) provides the corporate voice messaging capabilities in the reference configuration and its provisioning is beyond the scope of this document.
- Inbound calls from PSTN were sent from AT&T IP Toll Free service, through the Session Border Controller to the Session Manager which routed the call to Communication Manager. Communication Manager terminated the call to the appropriate agent/phone or fax extension. The H.323 phones on the enterprise side registered to the Communication Manager C-LAN. The SIP phones on the enterprise side registered to the Session Manager.

² The AT&T IP Toll Free service uses SIP over UDP to communicate with enterprise edge SIP devices, e.g., the Session Border Controller in this sample configuration. Session Manager may use SIP over UDP, TCP, or TLS to communicate with SIP network elements, e.g., the Session Border Controller and Communication Manager. In the reference configuration, Session Manager uses SIP over TCP to communicate with the Session Border Controller and Communication Manager.

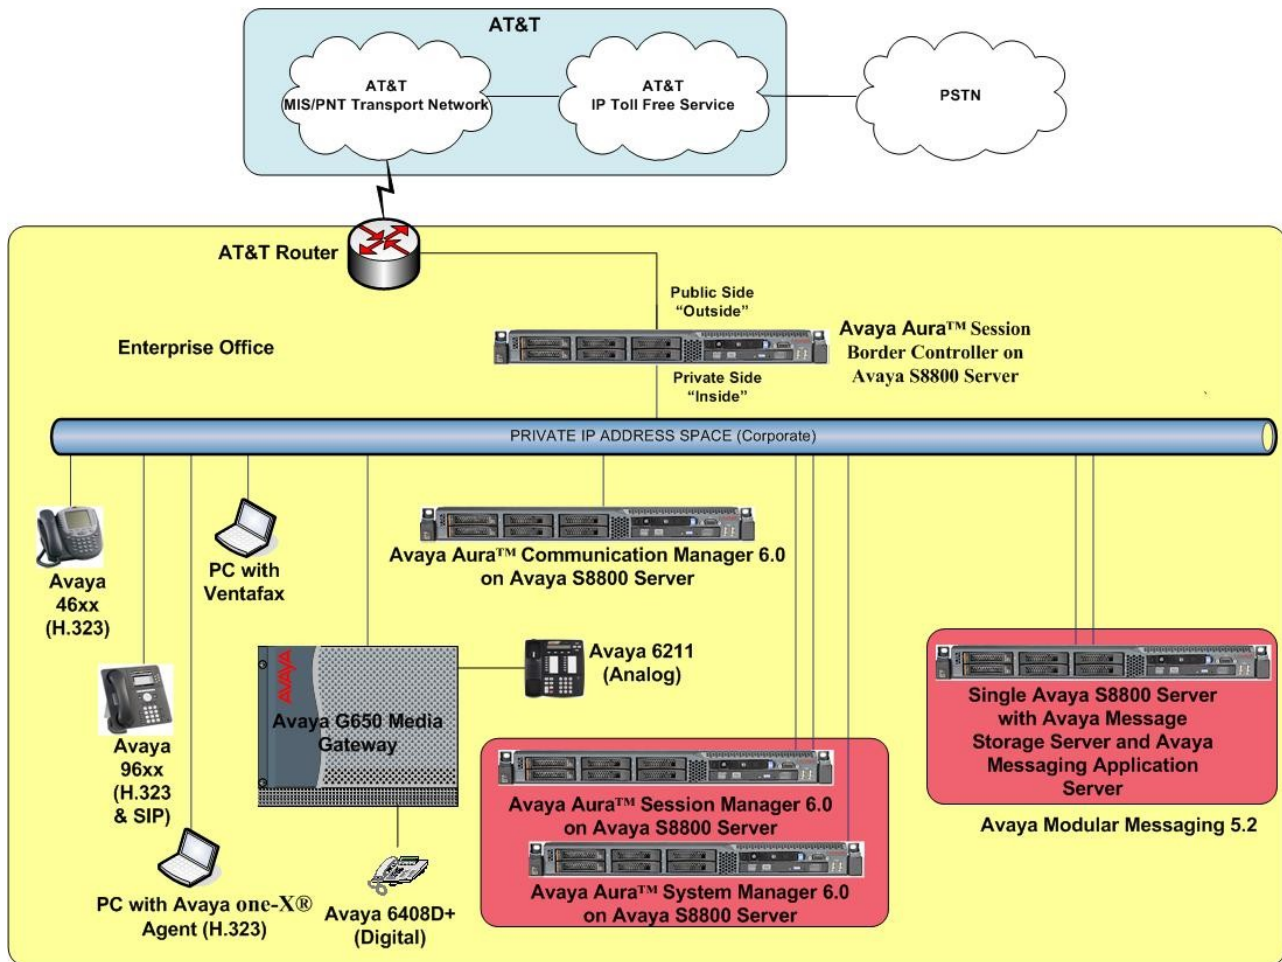

Figure 1: Reference configuration

2.1. Illustrative Configuration Information

The specific values listed in the table below and in subsequent sections are used in the reference configuration described in these Application Notes, and are **for illustrative purposes only**. Customers must obtain and use the specific values for their own specific configurations.

Note - The AT&T IP Toll Free service border element IP addresses shown in this document are examples. AT&T Customer Care will provide the actual IP addresses as part of the IP Toll Free service provisioning process.

Component	Illustrative Value in these Application Notes
Avaya Aura™ System Manager	
Management IP Address	10.80.120.21
Avaya Aura™ Session Manager	
Management IP Address	10.80.120.27
Network IP Address	10.80.120.28
Avaya Aura™ Communication Manager	
C-LAN IP Address	10.80.111.31
VDN	6665310 to 6665313
Skill (Hunt Group)	11, 12, 13
Agent login ID's	6665611 to 6665615
Hunt Group Extensions	6665711 (11), 6665712 (12), 6665713 (13)
Phone Extensions	66650xx – H323 Phones 66654xx – SIP Phones 66651xx – Analog Phone 66652xx – Digital Phones
Voice Messaging Pilot Extension	666-4999
Avaya Modular Messaging	
Messaging Application Server (MAS) IP Address	10.80.100.30
Messaging Server (MSS) IP Address	10.80.100.29
Avaya Aura™ Session Border Controller	
IP Address of “Outside” (Public) Interface (connected to AT&T Access Router/IP Toll Free Service)	192.168.62.55 (active)
IP Address of “Inside” (Private) Interface (connected to Avaya Aura™ Session Manager)	10.80.130.12 (active)
AT&T IP Toll Free Service	
Border Element IP Address	135.242.225.200
Digits passed in SIP-URI Request	00000105x, 00000106x

Table 1: Illustrative Values Used in these Application Notes

2.2. Call Flows

To understand how inbound AT&T IP Toll Free service calls are handled by Session Manager and Communication Manager, following call flows are described in this section.

2.2.1. Inbound Call

The first call scenario illustrated in the figure below is an inbound AT&T IP Toll Free service call that arrives on Session Manager and is subsequently routed to Communication Manager, which in turn routes the call to a phone, fax, or in some cases, a vector.

1. A PSTN phone originates a call to an AT&T IP Toll Free service number.
2. The PSTN routes the call to the AT&T IP Toll Free service network.
3. The AT&T IP Toll Free service routes the call to the Session Border Controller.
4. The Session Border Controller performs any necessary SIP header modifications, and routes the call to Session Manager.
5. Session Manager applies any necessary SIP header adaptations and digit conversions, and based on configured Routing Policies, determines to where the call should be routed next. In this case, Session Manager routes the call to Communication Manager.
6. Depending on the called number, Communication Manager routes the call to
 - A vector, which in turn, routes the call to an agent
 - Directly to an agent or a phone/fax extension.

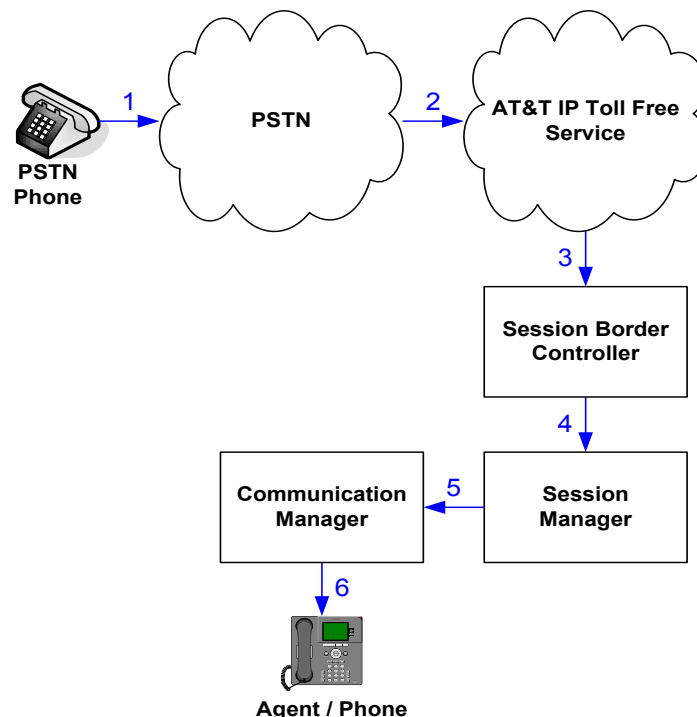

Figure 2: Inbound AT&T IP Toll Free Call to VDN/Agent/Phone

2.2.2. Coverage to Voicemail

The second call scenario illustrated in the figure below is an inbound call that is covered to voicemail. In this scenario, the voicemail system is a Modular Messaging system (MultiSite mode) connected to Session Manager.

1. Same as call scenario in **Section 2.2.1**.
2. The agent or phone on Communication Manager does not answer the call, and the call covers to their voicemail which Communication Manager forwards³ to Session Manager.
3. Session Manager applies any necessary SIP header adaptations and digit conversions, and based on configured Routing Policies, determines it needs to route the call to Modular Messaging which answers the call and connects the caller to the called agent/phone voice mailbox. Note that the call⁴ continues to go through Communication Manager.

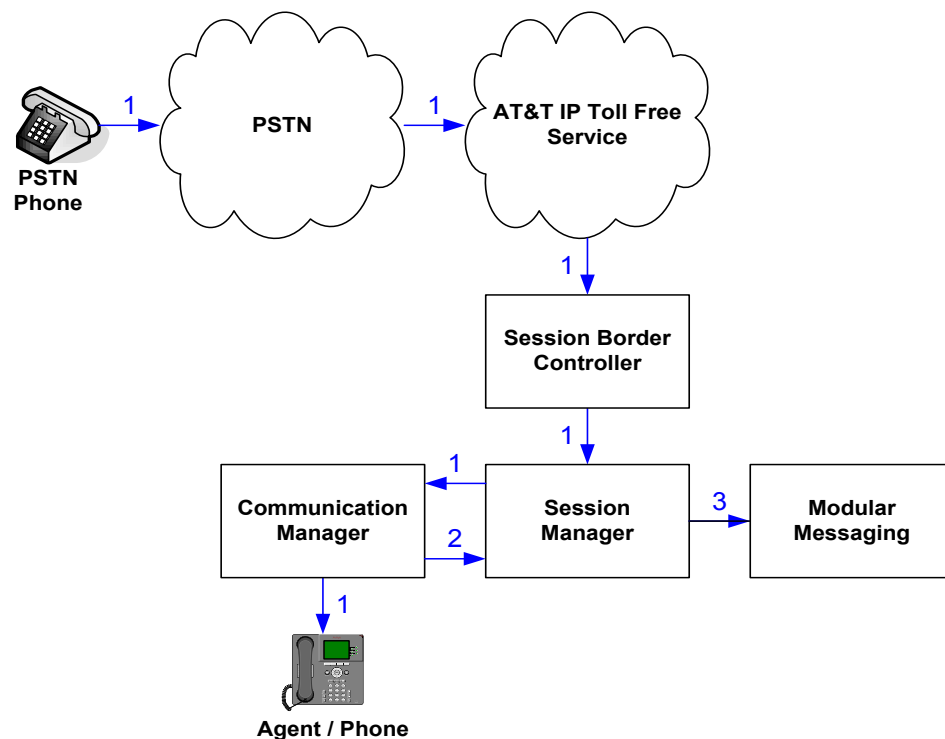

Figure 3: Inbound AT&T IP Toll Free Service Call to Agent/Phone Covered to Avaya Modular Messaging

³ Communication Manager places a call to Modular Messaging, and then connects the inbound caller to Modular Messaging. SIP redirect methods, e.g., 302, are not used.

⁴ The SIP signaling path still goes through Communication Manager. In addition, since the inbound call and Modular Messaging use different codecs (G.729 and G.711, respectively), Communication Manager performs the transcoding, and thus the RTP media path also goes through Communication Manager.

3. Equipment and Software Validated

The following equipment and software were used for the reference configuration described in these Application Notes.

Component	Version
Avaya S8800 Server	Avaya Aura™ System Manager 6.0 (6.0.0.0.556-3.0.6.1)
Avaya S8800 Server	Avaya Aura™ Session Manager 6.0 (6.0.0.0.600020)
Avaya S8800 Server	Avaya Aura™ Communication Manager 6.0 (R016x.00.0.345.0) with patch 18246
Avaya S8800 Server	Avaya Aura™ Session Border Controller 6.0 (R6.0.0.3.4), Product Version 36M2, Build Version 3.6.0, Build 46752 on VSP-6.0.1.0.5
Avaya G650 Media Gateway	
TN2312BP IP Server Interface (IPSI)	HW15 FW050
TN799DP Control-LAN (C-LAN)	HW01 FW037
TN2602AP IP Media Resource 320 (MedPro)	HW02 FW054
TN2501AP VAL-ANNOUNCEMENT	HW03 FW021
TN2224CP Digital Line	HW08 FW015
TN793CP Analog Line	HW04 FW010
Avaya 9630 IP Telephone	Avaya one-X® Deskphone Edition H.323 Version S3.1
Avaya 9620C IP Telephone	Avaya one-X® Deskphone Edition SIP Version 2.6.0 (sip96xx_2_6_0_0.bin)
Avaya one-X® Agent	2.0 with SP3
Avaya 4625SW IP Telephone	a25d01a2_8.bin
Avaya 6408D+ Digital phone	-
Avaya 6211 Analog phone	-
Avaya S8800 Single Server	Avaya Modular Messaging 5.2
Fax device	Ventafax Home Version 6.2
AT&T IP Toll Free Service using MIS/PNT transport service connection	VNI 18

Table 2: Equipment and Software Versions

Note - The solution integration validated in these Application Notes should be considered valid for deployment with Avaya Aura® Communication Manager release 6.0.1 and Avaya Aura® Session

Manager release 6.1. Avaya agrees to provide service and support for the integration of Avaya Aura® Communication Manager release 6.0.1 and Avaya Aura® Session Manager release 6.1 with the AT&T IP Toll Free service offer, in compliance with existing support agreements for Avaya Aura® Communication Manager release 6.0 and Avaya Aura® Session Manager 6.0, and in conformance with the integration guidelines as specified in the body of this document.

4. Avaya Aura™ Session Manager

These Application Notes assume that basic System Manager and Session Manager administration has already been performed. Consult [1] and [2] for further details if necessary. Configuration of Session Manager is performed from System Manager. To invoke the System Manager Common Console, launch a web browser, enter <https://<IP address of the System Manager server>/SMGR> in the URL, and log in with the appropriate credentials.

4.1. Background

Session Manager serves as a central point for supporting SIP-based communication services in an enterprise. Session Manager connects and normalizes disparate SIP network components and provides a central point for external SIP trunking to the PSTN. The various SIP network components are represented as “SIP Entities” and the connections/trunks between Session Manager and those components are represented as “Entity Links”. Thus, rather than connecting to every other SIP Entity in the enterprise, each SIP Entity simply connects to Session Manager and relies on Session Manager to route calls to the correct destination. This approach reduces the dial plan and trunking administration needed on each SIP Entity, and consolidates said administration in a central place, namely System Manager.

When calls arrive at Session Manager from a SIP Entity, Session Manager applies SIP protocol and numbering modifications to the calls. These modifications, referred to as “Adaptations”, are sometimes necessary to resolve SIP protocol differences between disparate SIP Entities, and also serve the purpose of “normalizing” the calls to a common or uniform numbering format, which allows for simpler administration of routing rules in Session Manager. Session Manager then matches the calls against certain criteria embodied in profiles termed “Dial Patterns”, and determines the destination SIP Entities based on “Routing Policies” specified in the matching Dial Patterns. Lastly, before the calls are routed to the respective destinations, Session Manager again applies Adaptations in order to bring the calls into conformance with the SIP protocol interpretation and numbering formats expected by the destination SIP Entities.

4.2. Routing Policies

Routing Policies define how Session Manager routes calls between SIP network elements. Routing Policies are dependent on the administration of several inter-related items:

- SIP Entities – SIP Entities represent SIP network elements such as Session Manager instances, Communication Manager systems, Session Border Controllers, SIP gateways, SIP trunks, and other SIP network devices.
- Entity Links – Entity Links define the SIP trunk/link parameters, e.g., ports, protocol (UDP/TCP/TLS), and trust relationship, between Session Manager instances and other SIP Entities.
- SIP Domains – SIP Domains are the domains for which Session Manager is authoritative in routing SIP calls. In other words, for calls to such domains, Session Manager applies Routing Policies to route those calls to SIP Entities. For calls to other domains, Session Manager routes those calls to another SIP proxy (either a pre-defined default SIP proxy or one discovered through DNS).

- **Locations** – Locations define the physical and/or logical locations in which SIP Entities reside. Call Admission Control (CAC) / bandwidth management may be administered for each location to limit the number of calls to and from a particular Location.
- **Adaptations** – Adaptations are used to apply any necessary protocol adaptations, e.g., modify SIP headers, and apply any necessary digit conversions for the purpose of inter-working with specific SIP Entities. As another example, basic “Digit Conversion” Adaptations are used in this reference configuration to convert digit strings in “destination” (e.g., Request-URI) and “origination” (e.g. P-Asserted Identity) type headers of SIP messages sent to and received from SIP Entities.
- **Dial Patterns** – A Dial Pattern specifies a set of criteria and a set of Routing Policies for routing calls that match the criteria. The criteria include the called party number and SIP domain in the Request-URI, and the Location from which the call originated. For example, if a call arrives at Session Manager and matches a certain Dial Pattern, then Session Manager selects one⁵ of the Routing Policies specified in the Dial Pattern. The selected Routing Policy in turn specifies the SIP Entity to which the call is to be routed. Note that Dial Patterns are matched after ingress Adaptations have already been applied.
- **Time Ranges** – Time Ranges specify customizable time periods, e.g., Monday through Friday from 9AM to 5:59PM, Monday through Friday 6PM to 8:59AM, all day Saturday and Sunday, etc. A Routing Policy may be associated with one or more Time Ranges during which the Routing Policy is in effect. For example, for a Dial Pattern administered with two Routing Policies, one Routing Policy can be in effect on weekday business hours and the other Routing Policy can be in effect on weekday off-hours and weekends. In the reference configuration no restrictions were placed on calling times.

The general strategy employed in this reference configuration with regard to Called Party Number manipulation and matching, and call routing is as follows:

- Use common number formats and uniform numbers in matching called party numbers for routing decisions.
- On ingress to Session Manager, apply any called party number modifications necessary to “normalize” the number to a common format or uniform number as defined in the Dial Patterns.
- On egress from SM, apply any called party number modifications necessary to conform to the expectations of the next-hop SIP Entity. For example, on egress from Session Manager to Communication Manager, modify the called party number such that the number is consistent with the dial plan on Communication Manager.

Of course, the items above are just several of many possible strategies that can be implemented with Session Manager.

To view the sequenced steps required for configuring network routing policies, click on “**Routing**” in the left pane of the System Manager Common Console (see below).

⁵ The Routing Policy in effect at that time with highest ranking is attempted first. If that Routing Policy fails, then the Routing Policy with the next highest rankings is attempted, and so on.

Introduction to Network Routing Policy

Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.

The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:

Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).

Step 2: Create "Locations"

Step 3: Create "Adaptations"

Step 4: Create "SIP Entities"

- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)
- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"

Step 5: Create the "Entity Links"

- Between Session Managers
- Between Session Managers and "other SIP Entities"

Step 6: Create "Time Ranges"

- Align with the tariff information received from the Service Providers

Step 7: Create "Routing Policies"

- Assign the appropriate "Routing Destination" and "Time Of Day"
- (Time Of Day = assign the appropriate "Time Range" and define the "Ranking")

Step 8: Create "Dial Patterns"

- Assign the appropriate "Locations" and "Routing Policies" to the "Dial Patterns"

Step 9: Create "Regular Expressions"

- Assign the appropriate "Routing Policies" to the "Regular Expressions"

Each "Routing Policy" defines the "Routing Destination" (which is a "SIP Entity") as well as the "Time of Day" and its associated "Ranking".

IMPORTANT: the appropriate dial patterns are defined and assigned afterwards with the help of the routing application "Dial patterns". That's why this overall routing workflow can be interpreted as

"Dial Pattern driven approach to define Routing Policies"

That means (with regard to steps listed above):

- Step 7: "Routing Policies" are defined
- Step 8: "Dial Patterns" are defined and assigned to "Routing Policies" and "Locations" (one step)
- Step 9: "Regular Expressions" are defined and assigned to "Routing Policies" (one step)

Figure 4: Main Routing Page

4.3. SIP Domains

The steps in this section specify the SIP domains for which Session Manager is authoritative.

1. In the left pane under **Routing**, click on “**Domains**”. In the **Domain Management** page click on “**New**” (not shown) and configure as follows:
 - **Name** –Set to **avaya.com** in this reference configuration
 - **Type** – Set to **sip**
 - **Notes** – Optional Field
2. Click on “**Commit**”
3. Repeat above steps to add additional domains.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top header features the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and a welcome message for user 'admin' with a 'Log off' link. A red breadcrumb trail indicates the path: 'Home / Routing / Domains'. On the left, a sidebar menu lists various system components, with 'Routing' expanded and 'Domains' selected. The main content area, titled 'Domain Management', contains a table with one entry: 'avaya.com' (Name), 'sip' (Type), and an unchecked 'Default' checkbox. A 'Notes' column is also present. Above the table, there are 'Commit' and 'Cancel' buttons. Below the table, a red asterisk indicates 'Input Required'.

Name	Type	Default	Notes
* avaya.com	sip	<input type="checkbox"/>	

Figure 5: Domain Management Page

4.4. Locations

The steps in this section define the physical and/or logical locations in which SIP Entities reside.

1. In the left pane under **Routing**, click on “**Locations**”. In the **Location** page [not shown] click on “**New**”.
2. In the **Location Details** page, configure as follows:
 - **Name** – Enter any descriptive string.
 - **Notes** – (Optional) Enter a description
 - **Managed Bandwidth** and **Average Bandwidth per Call** – (Optional) To limit the number of calls going to and from this location i.e., apply Call Admission Control.
 - **Location Pattern** - [Optional] To identify IP addresses associated with this Location. In the reference configuration, the IP address of Session Border Controller i.e. **10.80.130.12** was used.
3. Click on “**Commit**”.
4. Repeat above steps to add any additional Locations (e.g. **Subnet 10.80.100.x**, **10.80.120.x**, **Subnet 10.80.130.x**, **Subnet 10.80.111.x**) used in this Reference Configuration.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top header shows the Avaya logo, the product name 'Avaya Aura™ System Manager 6.0', and a welcome message for user 'admin' last logged on at June 14, 2010 4:35 PM. The breadcrumb trail indicates the current path: Home / Routing / Locations / Location Details. The left sidebar contains a navigation menu with categories like Elements, Events, Groups & Roles, Licenses, Routing (selected), Domains, Locations (highlighted), Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, Defaults, Security, System Manager Data, and Users. The main content area is titled 'Location Details' and includes 'Commit' and 'Cancel' buttons. It is divided into two sections: 'General' and 'Location Pattern'. The 'General' section contains fields for 'Name' (filled with 'AuraSBC'), 'Notes' (filled with 'AuraSBC used for ATT Testing'), 'Managed Bandwidth' (empty), and 'Average Bandwidth per Call' (filled with '80'). The 'Location Pattern' section has 'Add' and 'Remove' buttons and a table with one item. The table has columns for 'IP Address Pattern' and 'Notes'. The first row shows a checkbox, a red asterisk, the IP address '10.80.130.12', and the note 'Inside IP Address of the Aura SBC'. Below the table is a 'Select' dropdown set to 'All, None'. At the bottom, there is a red asterisk indicating 'Input Required' and 'Commit' and 'Cancel' buttons.

Figure 6: Location Details Page

4.5. Adaptations

Adaptations on Session Manager are always between Session Manager and another entity. Adaptations could potentially be applied to both calls coming into Session Manager and going out from the Session Manager. In this section, Adaptations are administered for calls from AT&T to Communication Manager (**Section 4.5.1**). Modification of SIP messages sent to Communication Manager are:

- The IP address of Session Manager is replaced with the Avaya CPE SIP domain (**avaya.com**) in the PAI Header.
- The AT&T DNIS in Request URI is replaced with an associated Communication Manager Extension/VDN.

4.5.1. Adaptation for calls to Avaya Aura™ Communication Manager

The Adaptation administered in this section is used for modification of SIP messages to Communication Manager only.

1. In the left pane under **Routing**, click on “**Adaptations**”. In the **Adaptations** page, click on “**New**” (not shown).
2. In the **Adaptation Details** page, configure as follows:
 - **Adaptation name** – Set to any descriptive string.
 - **Module name** - Select “**DigitConversionAdapter**” from the drop-down list; if no module name is present, select “<click to add module>” and enter “**DigitConversionAdapter**”.
 - **Module parameter** - Enter **osrcd=avaya.com**, which will replace the IP Address/Domain in the PAI header with the Avaya CPE domain (avaya.com) for egress to Communication Manager.
 - Configure **Digit Conversion for Outgoing Calls from SM** section as follows:
 - a) Click **Add**.
 - b) **Matching Pattern** – Add a matching pattern in the Request URI of the call coming into Session Manager.
 - c) **Min** and **Max** – Set the minimum and maximum value of the pattern to be matched.
 - d) **Delete Digits** – Set the number of digits to be deleted from the pattern.
 - e) **Insert Digits** – Set the number of digits to be added to the number in the Request URI.
 - f) **Address to modify** – Set the address to modify i.e. origination/destination or both.
 - g) **Notes** – [Optional]
 - Repeat the previous step for additional digit conversions to be configured.
 - The figure below lists the digit conversions done for calls coming from AT&T Toll Free service destined for Communication Manager. Note that the 9-digit DNIS coming from AT&T is converted to a 7-digit Communication Manager extension.
3. Click on “**Commit**”.

Note: In the reference configuration no **Digit Conversion for Incoming Calls to SM** are required.

Figure 7: Adaptation Details Page – Adaptation for Communication Manager

4.6. SIP Entities

In this section, SIP Entities are administered for the following SIP network elements:

- Avaya Aura™ Session Manager
- Avaya Aura™ Communication Manager
- Avaya Aura™ Session Border Controller
- Avaya SIP Endpoints SIP Entity
- Avaya Modular Messaging

Note – In this reference configuration TCP (port 5060) is used as the transport protocol between Session Manager and all the SIP Entities including Communication Manager. This was done to facilitate protocol trace analysis. However, Avaya best practices call for TLS (port 5061) to be used as transport protocol between Communication Manager and Session Manager in customer environments.

4.6.1. Avaya Aura™ Session Manager SIP Entity

1. In the left pane under **Routing**, click on “**SIP Entities**”. In the **SIP Entities** page click on “**New**” [not shown].
2. In the **General** section of the **SIP Entity Details** page, configure as follows:
 - **Name** – Enter a descriptive name for Session Manager (e.g. **SM1**).
 - **FQDN or IP Address** – Enter the IP address of the Session Manager network interface, (*not* the management interface), provisioned during installation. Set to **10.80.120.28** in this reference configuration.
 - **Type** – Select “**Session Manager**”.
 - **Location** – Select “**Location 1 Subnet 10.80.120.x**” as configured in **Section 4.4**.
 - **Outbound Proxy** – (Optional) Leave blank or select another SIP Entity. For calls to SIP domains for which Session Manager is not authoritative, Session Manager routes those calls to this **Outbound Proxy** or to another SIP proxy discovered through DNS if **Outbound Proxy** is not specified.
 - **Time Zone** – Select the time zone in which Session Manager resides.
3. In the **SIP Link Monitoring** section of the **SIP Entity Details** page select “**Use Session Manager Configuration**” for **SIP Link Monitoring** field.
4. In the **Port** section of the **SIP Entity Details** page, click on “**Add**” and provision an entry as follows:
 - **Port** – Enter “**5060**” (see note above).
 - **Protocol** – Select “**TCP**” (see note above).
 - **Default Domain** – (Optional) Select a SIP domain administered in **Section 4.3**.
5. Repeat **Step 4** to provision another entry, except with “**5080**” for **Port** and “**TCP**” for **Protocol**. Since a single C-LAN was used in this reference configuration, a separate port was configured to separate the SIP endpoint traffic from other traffic on C-LAN. This was done because of the known limitation noted in **Section 1.3, Item 4**.
6. Click on “**Commit**”.

These entries enable Session Manager to accept SIP requests on the specified ports/protocols.

Figure 8: SIP Entity Details Page –Session Manager SIP Entity

4.6.2. Avaya Aura™ Communication Manager SIP Entity

1. In the **SIP Entities** page, click on “New” [not shown].
2. In the **General** section of the **SIP Entity Details** page, configure as follows:
 - **Name** – Enter any descriptive name for the Communication Manager Signaling Interface.
 - **FQDN or IP Address** – Enter the IP address of the Communication Manager C-LAN provisioned in **Section 5.3, Step 5**.
 - **Type** – Select “CM”.
 - **Adaptation** – Select the Adaptation administered in **Section 4.5.1**.
 - **Location** – Select a Location administered in **Section 4.4**.
 - **Time Zone** – Select the time zone in which Communication Manager resides.
 - In the **SIP Link Monitoring** section of the **SIP Entity Details** page select “Use Session Manager Configuration” for **SIP Link Monitoring** field.
3. Click on “Commit”.

The screenshot shows the Avaya Aura™ System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.0", and a welcome message for user "admin" last logged on at July 29, 2010 7:20 PM. Below the navigation bar is a breadcrumb trail: "Home / Routing / SIP Entities / SIP Entity Details".

The left sidebar contains a tree view of the system configuration options, including Elements, Events, Groups & Roles, Licenses, Routing (selected), Domains, Locations, Adaptations, SIP Entities (highlighted), Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, Defaults, Security, System Manager Data, and Users. A "Help" section at the bottom of the sidebar provides links for "Help for SIP Entity Details fields", "Help for Committing configuration changes", and "Help for Committing configuration changes".

The main content area is titled "SIP Entity Details" and is divided into three sections: "General", "SIP Link Monitoring", and "Entity Links".

General Section:

- Name:** ATT-CLAN
- FQDN or IP Address:** 10.80.111.31
- Type:** CM
- Notes:** CLAN For ATT Testing
- Adaptation:** ATT CLAN
- Location:** Location 1 Subnet 10.80.111.x
- Time Zone:** America/Denver
- Override Port & Transport with DNS SRV:** ☐
- SIP Timer B/F (in seconds):** 4
- Credential name:** (empty field)
- Call Detail Recording:** none

SIP Link Monitoring Section:

- SIP Link Monitoring:** Use Session Manager Configuration

Entity Links Section:

Entity Links can be modified after SIP Entity is committed.

At the bottom of the form, there is a red asterisk indicating required input: "* Input Required".

Buttons for "Commit" and "Cancel" are located at the top right and bottom right of the form area.

Figure 9: SIP Entity Details Page –Communication Manager SIP Entity

4.6.3. Avaya Aura™ Session Border Controller SIP Entity

To configure the Session Border Controller Entity, repeat the Steps in **Section 4.6.2**. The **FQDN or IP Address** field is populated with the IP address of the private (inside) interface configured in **Section 7.1** and the **Type** field is set to “**Other**”. See the figure below for the values used in this reference configuration.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.0", and a welcome message for user "admin" last logged on September 15, 2010 at 2:56 PM. A secondary navigation bar shows the breadcrumb "Home / Routing / SIP Entities / SIP Entity Details".

On the left is a sidebar menu with categories: Elements, Events, Groups & Roles, Licenses, Routing (selected), Domains, Locations, Adaptations, SIP Entities (highlighted), Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, Defaults, Security, System Manager Data, and Users. Below the menu is a "Help" section with links for "Help for SIP Entity Details fields" and "Help for Committing configuration changes".

The main content area is titled "SIP Entity Details" and has "Commit" and "Cancel" buttons at the top right. It is divided into sections:

- General**: Contains fields for Name (AuraSBC), FQDN or IP Address (10.80.130.12), Type (Other), Notes (Avaya Aura SBC Inside IP), Adaptation (dropdown), Location (AuraSBC), Time Zone (America/Denver), Override Port & Transport with DNS SRV (checkbox), SIP Timer B/F (in seconds) (4), Credential name (text field), and Call Detail Recording (none).
- SIP Link Monitoring**: Contains a dropdown for SIP Link Monitoring set to "Use Session Manager Configuration".
- Entity Links**: Includes "Add" and "Remove" buttons and a table with 0 items. The table has columns: SIP Entity 1, Protocol, Port, SIP Entity 2, Port, and Trusted. A "Filter: Enable" link is at the top right of the table.

At the bottom, there is a "* Input Required" message and "Commit" and "Cancel" buttons.

Figure 10: SIP Entity Details Page – Session Border Controller SIP Entity

4.6.4. Avaya SIP Endpoints SIP Entity

Because of the shuffling limitation noted in **Section 1.3, Item 4** a separate SIP Entity was created to handle calls to and from SIP endpoints registered with Session Manager. A single CLAN was used in this reference configuration but a different port number was used as configured in **Section 4.6.1, Step 5**. Configuration for this Entity is similar to the Entity configured in **Section 4.6.2**.

Note: For routing the calls from SIP Endpoints to Communication Manager, this Entity has to be used in Application Sequence. The configuration of the Application Sequence on Session Manager is beyond the scope of this document.

The screenshot displays the Avaya Aura System Manager 6.0 interface. The top header shows the Avaya logo, the title 'Avaya Aura™ System Manager 6.0', and a welcome message for the 'admin' user. The breadcrumb trail indicates the current location: 'Home / Routing / SIP Entities / SIP Entity Details'. The left sidebar contains a navigation menu with categories like Elements, Events, Groups & Roles, Licenses, Routing (expanded), Domains, Locations, Adaptations, SIP Entities (selected), Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, Defaults, Security, System Manager Data, and Users. The main content area is titled 'SIP Entity Details' and features a 'General' tab. The configuration fields include: Name (AvayaSIPEndpointsTrunk), FQDN or IP Address (10.80.111.31), Type (CM), Notes (Trunk to Handle SIP Endpoints), Adaptation (ATT CLAN), Location (Location 1 Subnet 10.80.111.x), Time Zone (America/Denver), Override Port & Transport with DNS SRV (unchecked), SIP Timer B/F (4 seconds), Credential name, and Call Detail Recording (none). The 'SIP Link Monitoring' section shows 'Use Session Manager Configuration'. A red asterisk indicates required input fields. The bottom of the page has 'Commit' and 'Cancel' buttons.

Figure 11: SIP Entity Details Page – Avaya SIP Endpoints

4.6.5. Avaya Modular Messaging SIP Entity

To configure the Modular Messaging SIP Entity, repeat the steps in **Section 4.6.2**. The **FQDN or IP Address** field is populated with the IP address of the Modular Messaging Application Server (MAS) and the **Type** field is set to “**Other**”. See the figure below for the values used in this reference configuration.

4.7. Entity Links

In this section, Entity Links are administered between Session Manager and the following SIP Entities:

- Avaya Aura™ Communication Manager
- Avaya Aura™ Session Border Controller
- Avaya SIP Endpoints SIP Entity
- Avaya Modular Messaging

Note – In this reference configuration TCP (port 5060) is used as the transport protocol between Session Manager and all the SIP Entities including Communication Manager. This was done to facilitate protocol trace analysis. However, Avaya best practices call for TLS (port 5061) to be used as transport protocol between Communication Manager and Session Manager in customer environments.

4.7.1. Entity Link to Avaya Aura™ Communication Manager

1. In the left pane under **Routing**, click on “**Entity Links**”. In the **Entity Links** page click on “**New**” (not shown).
2. Continuing in the **Entity Links** page, provision the following:
 - **Name** – Enter a descriptive name for this link to Communication Manager (e.g. **SM1-ATTClan**).
 - **SIP Entity 1** – Select the SIP Entity administered in **Section 4.6.1** for Session Manager. SIP Entity 1 must always be an Session Manager instance.
 - **SIP Entity 1 Port** – Enter “**5060**”
 - **SIP Entity 2** – Select the SIP Entity administered in **Section 4.6.2** for Communication Manager.
 - **SIP Entity 2 Port** - Enter “**5060**”.
 - **Trusted** – Check the checkbox.
 - **Protocol** – Select “**TCP**”.
3. Click on “**Commit**”.

4.7.2. Entity Link to AT&T IP Toll Free Service via Session Border Controller

To configure the entity link between the Session Manager and Session Border Controller entities, repeat the steps in **Section 4.7.1**. The **SIP Entity 2** field is populated with the SIP Entity configured in **Section 4.6.3**. See the figure below for the values used in this reference configuration.

The screenshot shows the Avaya Aura System Manager 6.0 interface. The left sidebar contains a navigation menu with options: Elements, Events, Groups & Roles, Licenses, Routing (selected), Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, and Routing Policies. The main content area is titled 'Entity Links' and includes a 'Commit' and 'Cancel' button. Below the title, there is a table with 1 item. The table has columns: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, Port, Trusted, and Notes. The row shows: Name: SM1_AuraSBC, SIP Entity 1: SM1, Protocol: TCP, Port: 5060, SIP Entity 2: AuraSBC, Port: 5060, Trusted: checked, and Notes: empty. A 'Filter: Enable' link is present. At the bottom, there is a '* Input Required' message and another 'Commit' and 'Cancel' button.

4.10. Routing Policies

In this section, Routing Policies are administered for routing calls to the following SIP Entities:

- Routing Policy to Avaya Aura™ Communication Manager for calls from AT&T
- Routing Policy to Avaya Modular Messaging

4.10.1. Routing Policy to Communication Manager

1. In the left pane under **Routing**, click on “**Routing Policies**”. In the **Routing Policies** page click on “**New**” (not shown).
2. In the **General** section of the **Routing Policy Details** page, enter a descriptive **Name** (e.g. **To_ACM**) for routing calls from AT&T, and ensure that the **Disabled** checkbox is unchecked to activate this Routing Policy.

4.11. Dial Patterns

In this section, Dial Patterns are administered matching the following calls:

- Inbound PSTN calls via AT&T IP Toll Free service.
- Calls to Avaya Modular Messaging pilot number.

4.11.1. Matching Inbound Calls from AT&T IPTF to Communication Manager

In this example inbound calls from any PSTN number with the pattern 0000010xx are defined.

1. In the left pane under **Routing**, click on “**Dial Patterns**”. In the **Dial Patterns** page click on “**New**” (not shown).
2. In the **General** section of the **Dial Pattern Details** page, configure as follows:
 - **Pattern** – Enter matching patterns for inbound dialed digits. Set to **0000010** in this example.
 - **Min** and **Max** – Enter **9**.
 - **SIP Domain** – Select one of the SIP Domains defined in **Section 4.3** or “**-ALL-**”, to select all of those administered SIP Domains. Only those calls with the same domain in the Request-URI as the selected SIP Domain (or any of the administered SIP Domains if “**-ALL-**” is selected) can match this Dial Pattern. Set to **avaya.com** in this example.
 - (Optional) Add any notes if desired.
3. In the **Originating Locations and Routing Policies** section of the **Dial Pattern Details** page, click on “**Add**”.

4.11.2. Matching Inbound Calls to Avaya Modular Messaging Pilot Number via Avaya Aura™ Communication Manager

Communication Manager stations cover to Modular Messaging using a pilot extension (6664999 in this reference configuration). Also, stations on Communication Manager may dial this number to retrieve messages or modify mailbox settings. To match dial pattern for the calls covered to Modular Messaging, repeat the Steps in **Section 4.11.1**. In the **Originating Location** section of the **Originating Location and Routing Policy List** page, select the locations from where calls can originate to be routed to Modular Messaging. Note that only those calls that originate from the selected Location(s), or any of the administered Locations if “-ALL-” is selected, can match this Dial Pattern. See the figure below for the values used in the reference configuration. See **Section 4.12** for all the Dial Patterns used in this reference configuration.

5. Avaya Aura™ Communication Manager

This section describes the administration steps for Communication Manager in support of the reference configuration described in these Application Notes. The steps are performed from the Communication Manager System Access Terminal (SAT) interface. For any values not configured, defaults are used in this reference configuration. These Application Notes assume that basic Communication Manager administration has already been performed. Consult [3] and [4] for further details if necessary.

Note – In the following sections, only the parameters that are highlighted in **bold** text are applicable to this reference configuration. Other parameter values may or may not match specific local configurations.

5.1. System Parameters

This section reviews the Communication Manager licenses and features that are required for the reference configuration described in these Application Notes. For required licenses that are not enabled in the steps that follow, contact an authorized Avaya account representative to obtain the licenses.

1. Enter the **display system-parameters customer-options** command. On Page 2 of the **system-parameters customer-options** form, verify that the **Maximum Administered SIP Trunks** number is sufficient for the number of expected SIP trunks.

display system-parameters customer-options		Page	2 of 11
OPTIONAL FEATURES			
IP PORT CAPACITIES		USED

5.2. Dial Plan and Feature Access Codes

This section briefly describes the dial plan requirements and feature access codes for the reference configuration described in these Application Notes.

1. Enter the **change dialplan analysis** command to provision the dial plan. Note the following dialed strings administered in the figure below:
 - 3-digit dial access codes (indicated with a **Call Type** of “**dac**”) beginning with the digit “**1**”. Trunk Access Codes (TACs) defined for trunk groups in this reference configuration conform to this format.
 - 7-digit extensions with a **Call Type** of “**ext**” beginning with the digits “**6665**”. Local extensions for Communication Manager stations, agents, and Vector Directory Numbers (VDNs) in this reference configuration conform to this format.
 - 1-digit facilities access code (indicated with a **Call Type** of “**fac**”), e.g., “**9**” access code for outbound ARS dialing and “**8**” for AAR local dialing.
 - 3-digit facilities access codes, e.g., codes starting with “*****” and “**#**” for Agent logon/logoff).

change dialplan analysis						Page 1 of 12

5.3. IP Network Parameters

These Application Notes assume that the appropriate IP network regions and IP codec sets have already been administered to support internal calls, i.e., calls within the Avaya site. For simplicity in this reference configuration, all Communication Manager elements, e.g., stations, C-LAN and MedPro boards, etc., within the Avaya site are assigned to a single IP network region and all internal calls use a single IP codec set. Additionally, this section describes the steps for administering IP network regions and codec sets for external calls between the Avaya site and the AT&T IP Toll Free network.

1. Enter the **change ip-codec-set *ci*** command, where ***ci*** is the number of an IP codec set used only for **internal** calls. In this reference configuration, following codecs were used for internal calls.

change ip-codec-set 2		Page 1 of 2	
IP Codec Set			
Codec Set: 2			
Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size (ms)
1: G.711MU	n	2	20
2: G.729B	n	2	20
3: G.729A	n	2	20

Figure 40: IP Codec Set Form for Internal Calls – Page 1

- On Page 2 of the **ip-codec-set** form, set **FAX Mode** to “**t.38-standard**”.

change ip-codec-set 2		Page 2 of 2	
IP Codec Set			
Allow Direct-IP Multimedia? n			
	Mode	Redundancy	
FAX	t.38-standard	0	
Modem	off	0	
TDD/TTY	US	3	
Clear-channel	n	0	

Figure 41: IP Codec Set Form for Internal Calls – Page 2

- Repeat this step as necessary for each IP codec set used only for internal calls.

- Enter the **change ip-codec-set ce** command, where **ce** is the number of an unused IP codec set. This IP codec set will be used for external calls. On Page 1 of the **ip-codec-set** form, provision the codecs in the order shown in figure below:

Note - The **Frames Per Pkt** and **Packet Size (ms)** values for **G.729A**, **G711MU** and **G.726A-32K** are set according to the requirements of the AT&T IP Toll Free service.

```
change ip-codec-set 3
```

Page 1 of 2

IP Codec Set

Codec Set: 3

Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size (ms)
1: G.729A	n	2	20
2: G.711MU	n	2	20
3: G.726A-32K	n	2	20

Figure 42: IP Codec Set Form for External Calls – Page 1

- On Page 2 of the **ip-codec-set** form, set **FAX Mode** to “t.38-standard”.

```
change ip-codec-set 3
```

IP	ASM1	10.80.120.28
IP	procr	10.80.111.73
IP	default	0.0.0.0

Figure 48: Node Names Form

5.4. Alternate Automated Routing (AAR) Table

The AAR table is selected based on the caller dialing the AAR access code (e.g. “8”) as defined in **Section 5.2**. The access code is removed and the AAR table matches the remaining dialed digits and sends them to the designated route pattern (see **Section 5.6**). Configure as follows:

- **Dialed String** – Set to **6665** for calls to SIP endpoints registered with Session Manager.
- **Min** and **Max** - Set to **7**, the minimum and maximum size the dialed string will assume.
- **Route Pattern** – Set to **21** as configured in **Section 5.6**.
- **Call Type** – Set to **aar**.
- Repeat the above steps for calls to Modular Messaging pilot number **6664999**. Note in this case the **Call Type** field is set to **unku**.

change aar analysis 0							Page	1 of	2
AAR DIGIT ANALYSIS TABLE							Percent Full: 1

6665	7	7	21	aar		n			
6664999	7	7	21	unku		n			

Figure 49: AAR Analysis Form

5.5. SIP Trunks

Two SIP trunks are defined on Communication Manager in the reference configuration:

- Inbound for AT&T access – SIP Trunk 1
- Local for Modular Messaging and Avaya SIP telephone access – SIP Trunk 2

SIP trunks are defined on Communication Manager by provisioning a Signaling Group and a corresponding Trunk Group.

Note – In the reference configuration TCP (port 5060) is used as the transport protocol between Session Manager and all the SIP Entities including Communication Manager. This was done to facilitate protocol trace analysis. However, Avaya best practices call for TLS (port 5061) to be used as transport protocol between Communication Manager and Session Manager in customer environments.

5.5.1. SIP Trunk for AT&T Access

This section describes the steps for administering the SIP trunk connecting to Session Manager used for AT&T access. This trunk connects to the **SM1** Entity defined in **Section 4.6.1**.

1. Enter the **add signaling-group x** command, where **x** is the number of an unused signaling group (e.g. **20**), and provision the following:
 - **Group Type** – Set to “**sip**”.
 - **Transport Method** – Set to “**tcp**”. Note – Although TCP is used as the transport protocol between the Avaya CPE components, the transport protocol used between the Session Border Controller and the AT&T IP Toll Free service is UDP.
 - Verify that **Peer Detection Enabled** is “**y**” and that **Peer Server** is **SM**.
 - **Near-end Node Name** – Set to the node name of the CLAN i.e. **CLAN-1A03** noted in **Section 5.3, Step 5**.
 - **Far-end Node Name** – Set to the node name of Session Manager i.e. **ASM1** noted in **Section 5.3, Step 5**.
 - **Near-end Listen Port** and **Far-end Listen Port** – set to “**5060**” (see Transport Method note above).
 - **Far-end Network Region** – Set to the IP network region **3**, as defined in **Section 5.3, Step 4**.
 - **Far-end Domain** – Enter **avaya.com**. This is the domain inserted by Session Manager in **Section 4.5.1**.
 - **DTMF over IP** – Set to “**rtp-payload**” to enable Communication Manager to use DTMF according to RFC 2833.
 - **Direct IP-IP Audio Connections** – Set to “**y**”, indicating that the RTP paths should be optimized to reduce the use of Communication Manager audio resources when possible.
 - **Enable Layer 3 Test** – Set to “**y**”. This allows Communication Manager to send SIP OPTIONS “pings” to Session Manager to monitor link status.

2. Enter the **add trunk-group x** command, where x is the number of an unused trunk group (e.g. 20). On **Page 1** of the **trunk-group** form, provision the following:
 - **Group Type** – Set to “sip”.
 - **Group Name** – Enter any descriptive name.
 - **TAC** – Enter a trunk access code that is consistent with the dial plan.
 - **Direction** – Set to “incoming”.
 - **Service Type** – Set to “public-ntwrk”.
 - **Signaling Group** – Set to the number of the signaling group administered in **Step 1**.
 - **Number of Members** – Enter the maximum number of simultaneous calls permitted on this trunk group (e.g. 20).

5.5.2. Local SIP Trunk (Modular Messaging and SIP Telephones)

This section describes the steps for administering the local SIP trunk for Avaya Modular Messaging and SIP Telephone traffic.

1. Enter the **add signaling-group x** command, where **x** is the number of an unused signaling group (e.g. **21**), and follow the same procedures described in **Section 5.5.1, Step 1**, except:
 - **Far-end Network Region** – Set to the IP network region **2**, as defined in **Section 5.3**.
 - **Near-end Listen Port** and **Far-end Listen Port** – set to “**5080**” (see **Section 4.6.1, Step 5** for using a different port number).
 - **Direct IP-IP Audio Connections** – Set to “**n**”. In an AT&T IP Toll Free environment, shuffling needs to be disabled for Avaya SIP telephones as noted in **Section 1.3, Item 4**.
 - **Enable Layer 3 Test** – Set to “**n**”.

5.7. Optional Features

5.7.1. Call Center Provisioning

For provisioning the call center functionality, verify that the call center parameters are enabled as shown below. Verify that an agent login id is created with an appropriate skill. Verify the skill (hunt group) for that agent is in place. Make sure that a VDN as per the dial plan is in place along with the vector which lists the steps to be executed when an inbound call is received from AT&T IP Toll Free service.

Note - The administration of Communication Manager Call Center elements – hunt groups, vectors, and Vector Directory Numbers (VDNs) are beyond the scope of these Application Notes. Additional licensing may be required for some of these features. Consult[3], [4], [5], and [6] for further details if necessary. The samples that follow are provided for reference purposes only.

Figure 61: Call Center Optional Features Form

In the reference configuration below, an inbound call from AT&I IP Toll Free service is handled using the VDN 6665310 (**Figure 66**) which routes the call to Vector 10 (**Figure 67**) and based upon the digit inputted by the caller, the call is directed to an appropriate skill. Skill 11 (**Figure 68**) is shown for reference purposes and additional skills can be similarly added.

5.7.2. Modular Messaging Coverage Path and Hunt Group

Hunt group 1 is used in the reference configuration to verify Modular Messaging coverage functionality. This hunt group is defined with the 7 digit Modular Messaging pilot number **6664999**. The hunt group is associated with call **coverage path 1** in **Figure 69** and the coverage path is assigned to a station (e.g., **6665011** in **Figure 72**). Communication Manager will use the AAR access code “8” (defined in **Section 5.4**) to dial Modular Messaging (e.g. **86664999**) as shown in **Figure 71**.

6. Avaya Modular Messaging

In this reference configuration, Avaya Modular Messaging is used to verify DTMF, Message Wait Indicator (MWI), as well as basic call coverage functionality. The Avaya Modular Messaging used in the reference configuration is provisioned for Multi-Site mode. Multi-Site mode allows Avaya Modular Messaging to serve subscribers in multiple locations. The administration for Modular Messaging is beyond the scope of these Application Notes. Consult [7], [8], [9], and [10] for further details.

7. Avaya Aura™ Session Border Controller

This section illustrates an example of installation and configuration of the Session Border Controller. Similar to Communication Manager Release 6.0, the Session Border Controller runs on its own S8800 Server as an application template using Avaya Aura™ System Platform. The installation of the System Platform is assumed to have been previously completed.

The Session Border Controller includes a configuration wizard that can be used as part of the installation of the Session Border Controller template on System Platform. As such, screens from the installation of the SBC template are presented in **Section 7.1**. The wizard pre-configures the underlying Session Border Controller for much of the required provisioning. After the installation wizard is completed, subsequent configuration can be performed through the GUI as shown in **Section 7.2**.

In the Reference Configuration, the Avaya S8800 Server has four physical network interfaces, labeled 1 through 4. The port labeled “1” (virtual “eth0”) is used for the management and private (inside) network interface of the SBC. The port labeled “4” (virtual “eth2”) is used for the public (outside) network interface of the SBC.

Note: If using an Acme Packet Net-Net OS-E / Net-Net 2600 rather than an Avaya Aura™ Session Border Controller (SBC), the configuration can be obtained from the following Acme Packet website: <https://support.acmepacket.com>. Please note that an Acme Packet ID and Password are required.

7.1. Avaya Aura™ SBC Installation

To begin the SBC Template installation, log in to the System Platform console domain by entering `https://<ip-addr>/webconsole` as shown in the example screen below. In the Reference Configuration, the console domain uses the IP Address **10.80.130.11**, and the system domain uses the IP Address **10.80.130.10**. Enter an appropriate **User Id** and click **Continue**.

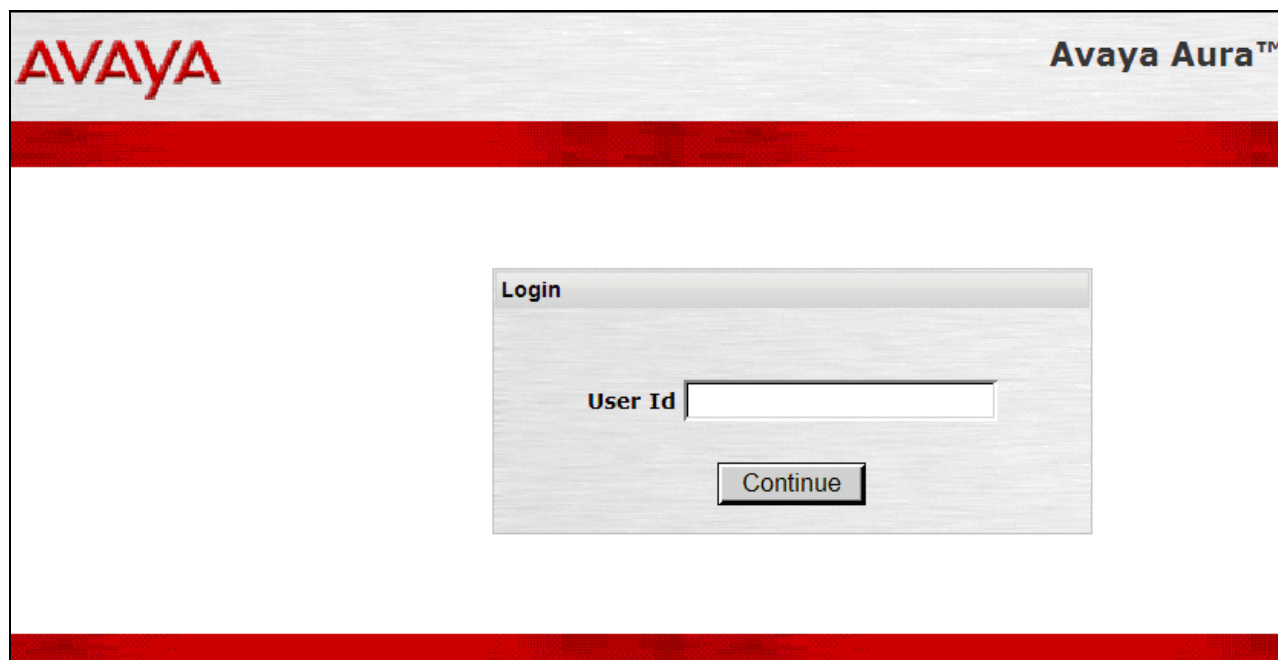

Figure 73: System Platform Console Domain Login screen

On the subsequent screen (not shown), enter the appropriate **Password** and click the **Log On** button.

Select **Virtual Machine Management** → **Solution Template**. In the **Install Template From** area, choose where the template files are located. In the sample configuration, the template was copied to the to USB drive. Click **Search**.

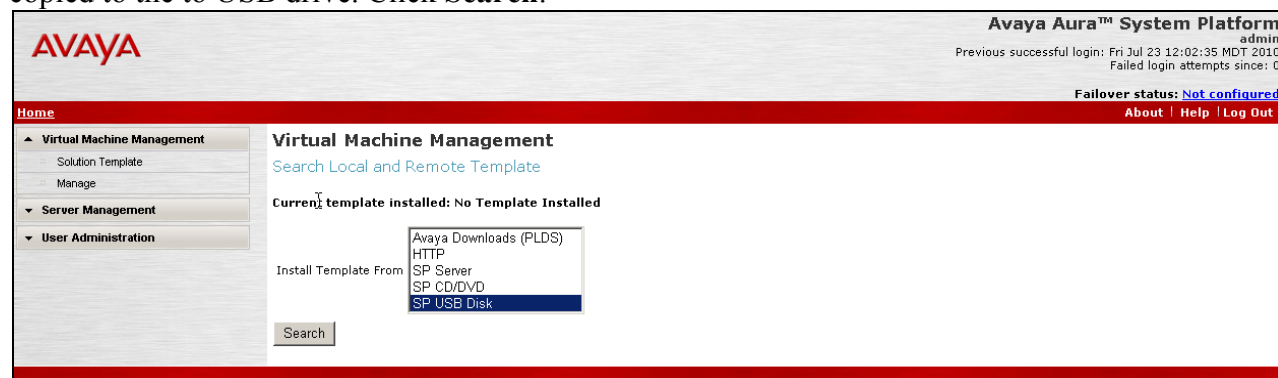

Figure 74: SBC Installation Template Search screen

Select the appropriate file, such as “SBCT.ovf”. Click the **Select** button.

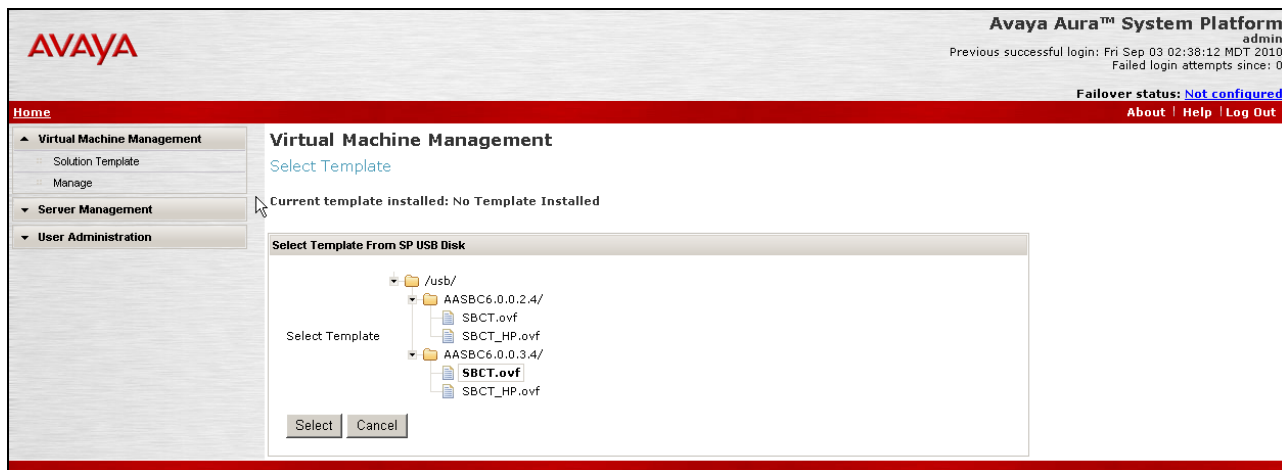

Figure 75: SBC Installation Template Selection screen

In the resultant screen shown below, the **Selected Template** can be observed. If an EPW file is available, it may be uploaded and used. In the sample configuration, the **Continue without EPW file** button was used.

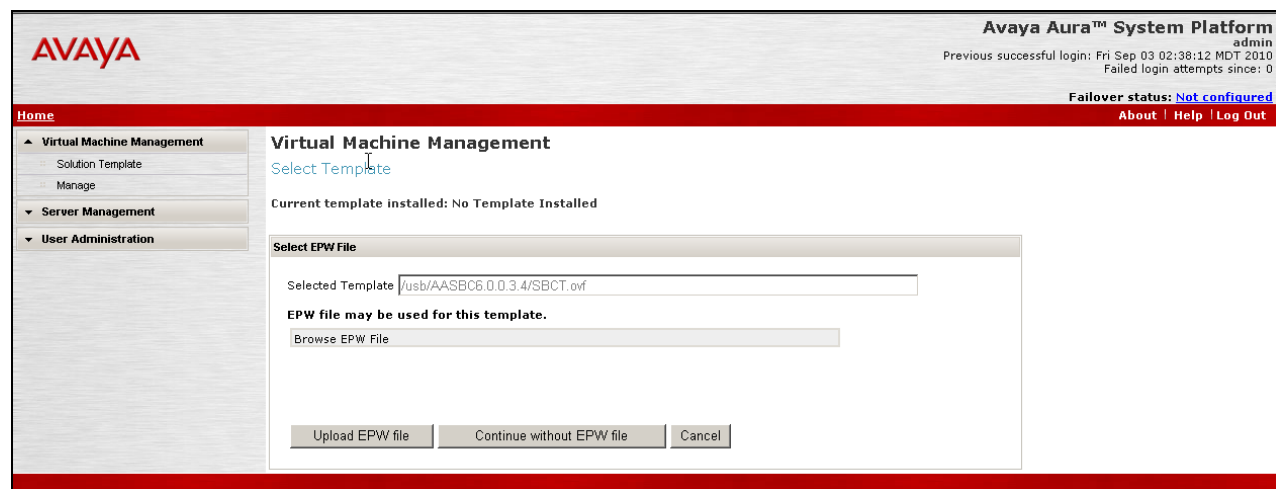

Figure 76: SBC Installation EPW screen

The **Template Details** screen is presented. If satisfied that the information is correct, click the **Install** button.

Figure 77: SBC Installation Template Details screen

The installation will proceed until user input is expected, as shown below. The following shows the first screen in a series, beginning with **Network Settings**. The SystemDomain Domain-0 IP Address, Console Domain CDom IP Address, Gateway IP Address, a Network Mask and Primary DNS and Secondary DNS (if configured) are pre-populated. This information was supplied during the System Platform installation. Enter the **IP Address** to be assigned to the SBC (e.g. **10.80.130.12**) and **Hostname** and click on **Next Step**. This IP Address becomes the private, inside IP Address as well as the management address for the Session Border Controller.

Virtual Machine	IP Address	Hostname	Domain
SBC	10.80.130.12	AvayaSBC	

Figure 78: SBC Installation Network Settings screen

The resulting screen (not shown) allows VPN Access parameters to be configured. Configure as appropriate, or skip, and click **Next Step**. In this reference configuration, this step was skipped.

The following screen shows the Session Border Controller Data entry screen. Note that the Private (Management) Interface information has already been completed with the IP Address (10.80.130.12) provided as the **Virtual Machine IP Address** on the first screen of the series.

Configure the **SIP Service Provider Data** section as follows:

- **Service Provider** – Set to **AT&T**
- **IP Address** – Set to the AT&T Border Element IP Address
- **Port** – Port number for the SIP Signaling port
- **Media Network** – Set to the AT&T Media Network
- **Media Netmask** – Set to the AT&T Media Netmask

Configure the **SBC Network Data** (Public section) as follows:

- **IP Address** – IP Address of the public interface of the Session Border Controller
- **NetMask** – Netmask for the public IP interface of the Session Border Controller
- **Gateway** – IP Address of the Gateway for the public side of the Session Border Controller

Configure the **Enterprise SIP Server** section as follows:

- **IP Address** – Set to IP Address of the Session Manager network Interface configured in Section 4.6.1.
- **Transport** – Set to **TCP** in Reference Configuration; **TLS** may be used in production environment.
- **SIP Domain** – Set to **avaya.com**
- Click **Next Step**

WARNING - the country specific values configured by the installation wizard are based upon those that have typically been used, in similar installations, in those countries in the past. Due to the many different ways in which systems may be configured, even within the same country, it is your responsibility to verify (after installation) that all parameters are consistent with those required by local and national laws and that the system has been correctly configured to guard against toll fraud and other security vulnerabilities, see *Avaya Toll Fraud and Security Handbook*, 555-025-600.

This is particularly important for emergency service numbers. **Avaya is not responsible or liable for any damages resulting from toll fraud, or failure to configure the system to comply with local or national laws or from misplaced emergency calls made from an Avaya endpoint.**

7.2. Avaya Aura™ Session Border Controller Configuration

After the installation wizard is completed, and proper service provider (i.e. AT&T) is selected, there would be no need to do any further configuration in future releases. However, in the current release of the Session Border Controller, some additional configuration needs to be performed through the GUI on the SBC. The configuration screens will be familiar to the reader experienced with the Acme Packet Net-Net OS-E.

7.2.1. Login and License Installation

To log in, either select the wrench  [sbc](#) icon shown in the prior screen, or enter the `https://<ip-addr>` where <ip-addr> is the management IP Address of the SBC. Enter appropriate **Username** and **Password** and click **Login**.

Acme Packet Net-Net OS-E

To access the NNOS-E management interface, you must first log in. Please provide your user name and password.

- Click the **Tools** tab and select the **Upload license file** from the left pane.
- Select the location where the license file is located.
- Check the **Apply License** box.
- Click **Upload**.
- If the license install is successful, a message is displayed.
- Click the **Configuration** tab.
- On the Configuration screen (not shown), click on **Configuration** in the left pane and select **Update and save configuration**.
- Click the **Actions** tab and select **restart** from the left pane to reboot SBC.
- After the reboot the SBC, the license is enabled.

Figure 87: SBC Upload License File screen

7.2.2. Stripping SIP Headers

Session Border Controller can be used to strip SIP headers. For headers that have relevance only within the enterprise, it may be desirable to prevent these header from being sent to the public SIP Service Provider. For example, Session Manager Release 6 inserts the P-Site header and the following procedures may be used to strip it.

- Select the **Configuration** tab. Using the menu on the left hand side, select **vsp** → **default-session-config**, then locate **header-settings** under the **header:** section as shown in the screen below. Select the **Configure** link on the right.

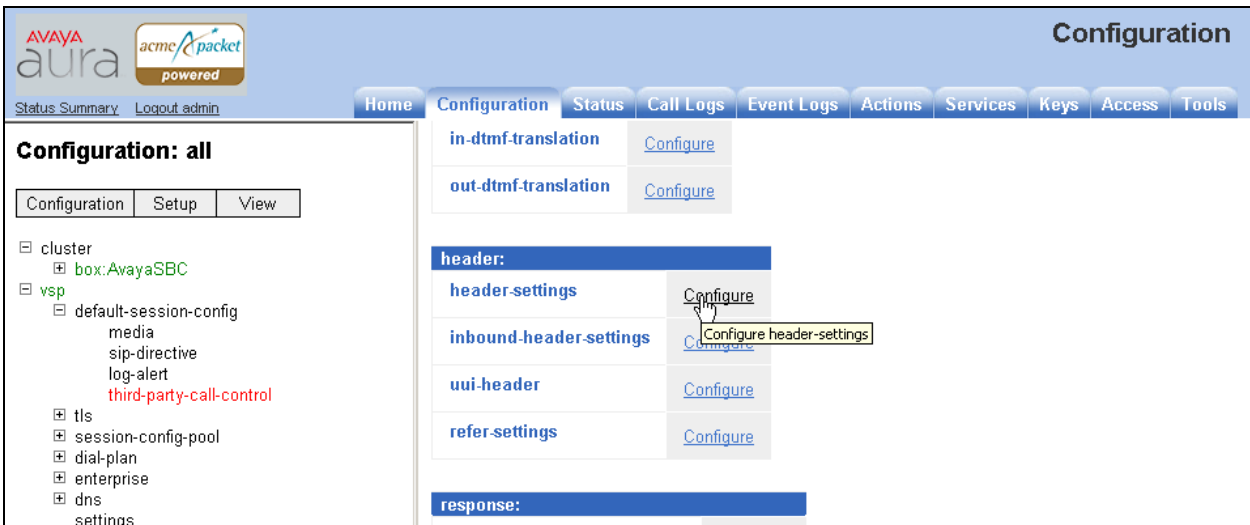

Figure 88: SBC Configuration header-settings

- In the subsequent screen (not shown) click **Edit blocked-header** and the following screen is displayed. Enter the header **P-Site** to be blocked and click **OK**.

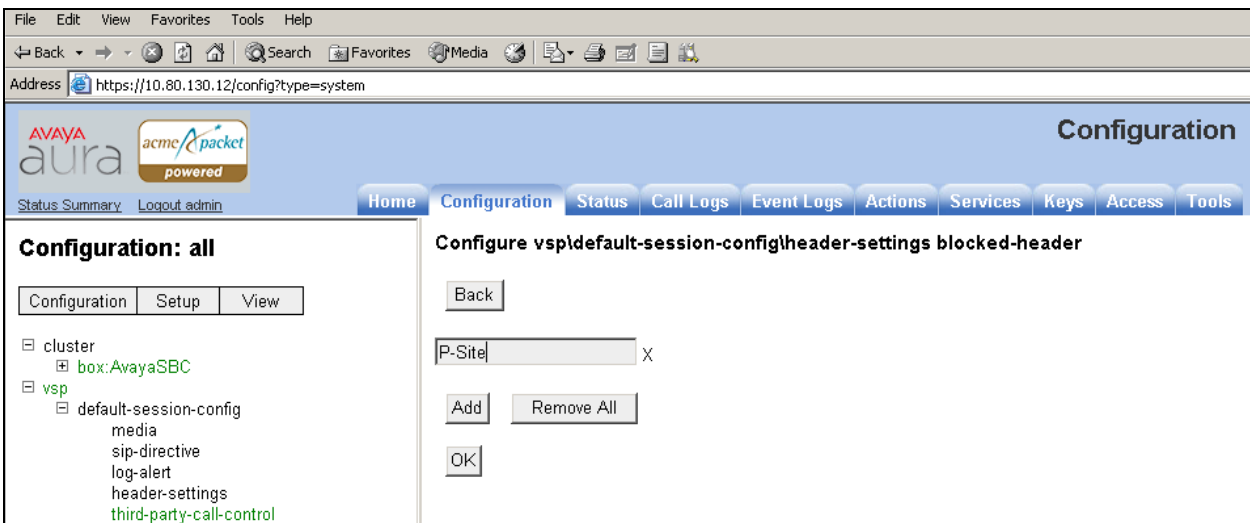

Figure 89: SBC Configuration blocked-header Entry

- The following screen is displayed indicating that P-Site header is configured to be blocked. Click **Set**.

The screenshot shows the Avaya Aura Configuration interface. The top navigation bar includes links for Home, Configuration, Status, Call Logs, Event Logs, Actions, Services, Keys, Access, and Tools. The left sidebar shows a tree view of configuration options under 'Configuration: all', with 'vsp' and 'default-session-config' expanded. The main content area is titled 'Configure vspdefault-session-configheader-settings' and includes a 'Show advanced' button. Below the title are buttons for Set, Reset, Back, and Delete. The configuration table has the following rows:

allowed-header	Edit allowed-header
blocked-header	P-Site Edit blocked-header
altered-header	Add altered-header
reg-ex-header	Add reg-ex-header
header-normalization	Add header-normalization
altered-body	Add altered-body
reg-ex-collector	Add reg-ex-collector
apply-allow-block-to	requests-and-responses (apply to requests and responses)
apply-to-allow-block-to-dialog	both (Apply to both inbound and outbound dialogs.)

At the bottom of the configuration area are buttons for Set, Reset, and Back.

Figure 90: SBC Configuration blocked-header

7.2.3. ICMP Configuration For AT&T OPTIONS Message Response

Navigate to **cluster→box:AvayaSBC→interface eth2→ip outside** and click on **Configure** for **icmp** to allow Session Border Controller to respond to OPTIONS messages from AT&T Border Element.

Figure 91: SBC Configuration ICMP

- Select **enabled** in the **admin** field and click **Set**.

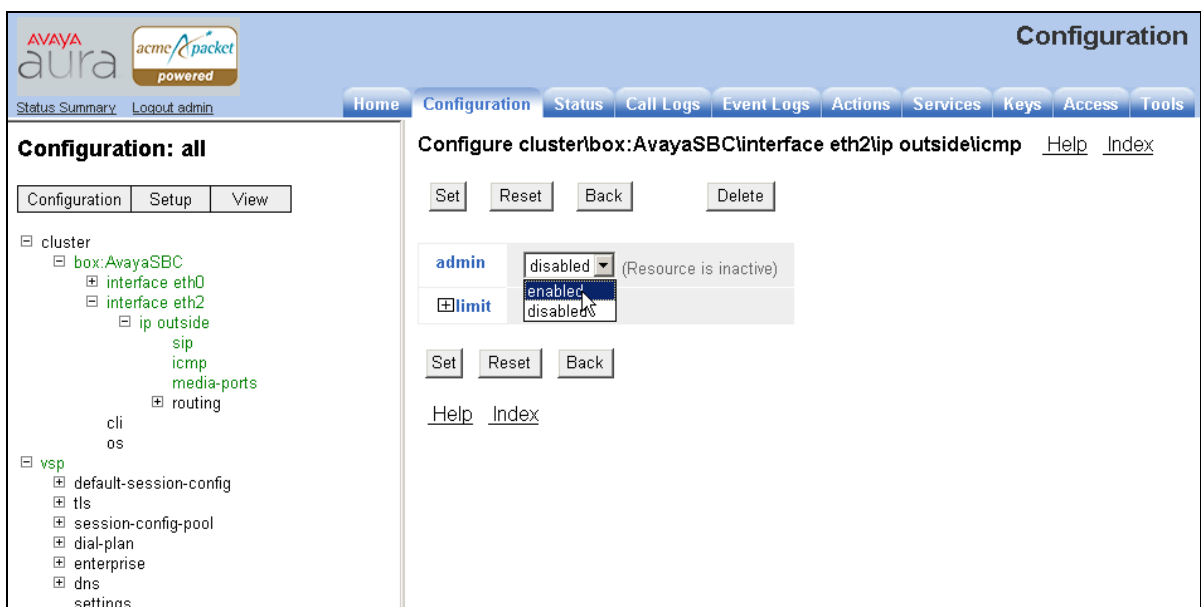

Figure 92: SBC Configuration Enable ICMP Admin

7.2.4. Contact Header Update

To enable the contact header to be updated after calls are transferred for both inbound and outbound calls, following configuration needs to be done:

1. Disable Third Party Call Control

- To disable third party call control, navigate to **vsp** → **default-session-config** → **third-party-call-control** and select **disabled** in the **admin** field. Click **Set**.

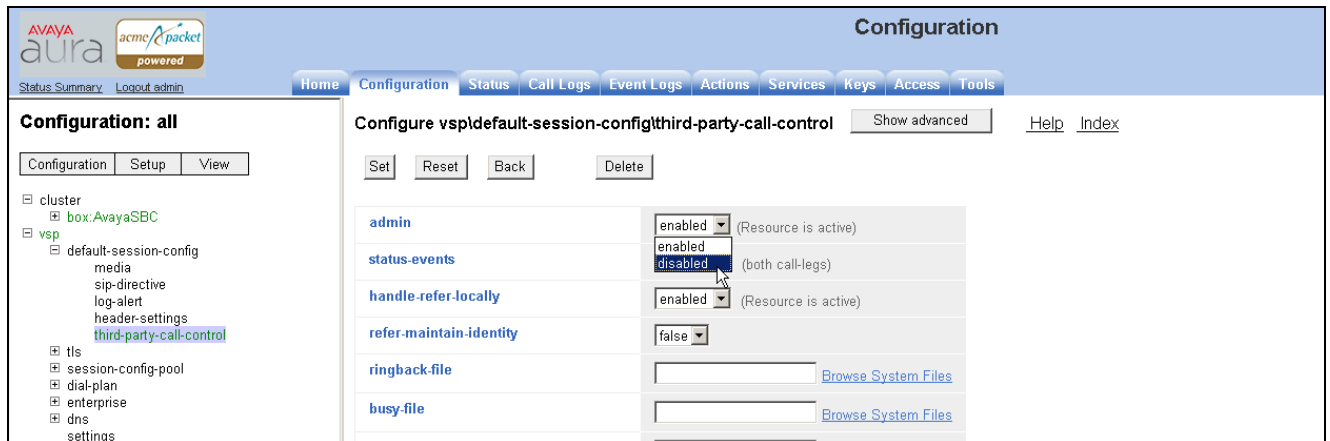

Figure 93: SBC Configuration Disabling Third Party Call Control

2. Enable Use Incoming Contact for both inside and outside leg for calls coming into PBX from AT&T IP Toll Free service.

- Navigate to **vsp** → **enterprise** → **servers** → **sip-gateway PBX** → **vsp\session-config-pool\entry ToPBX** and click **Configure** for **contact-uri-setting-in-leg**.

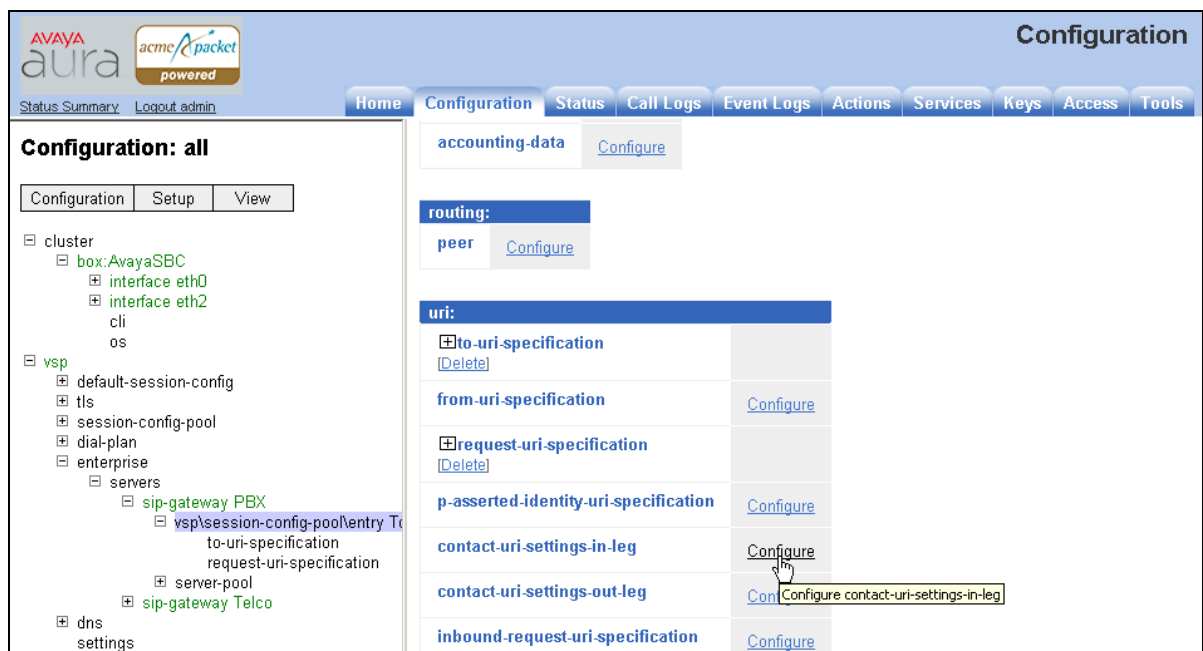

Figure 94: SBC Configuration Contact URI Settings

- Set **add-maddr** field to **disabled** and **use-incoming-contact** to **enabled** and click **Set**.

The screenshot shows the Avaya Aura Configuration web interface. The left sidebar displays a tree view of the configuration hierarchy: **cluster** > **box:AvayaSBC** > **interface eth0** > **interface eth2** > **cli** > **os** > **vsp** > **default-session-config** > **tls** > **session-config-pool** > **dial-plan** > **enterprise** > **servers** > **sip-gateway PBX** > **vsp\session-config-pool\entry ToPBX\contact-uri-settings-in-leg**. The main content area is titled "Configure vsp\session-config-pool\entry ToPBX\contact-uri-settings-in-leg" and includes buttons for **Set**, **Reset**, **Back**, and **Delete**. The configuration table below shows the following settings:

Field	Value	Notes
user	enter <input type="text" value="contact-uri"/> or select from <input type="text" value="contact-uri"/> (Net-N CONTACT URI.)	
host	enter <input type="text" value="CXC-address"/> or select from <input type="text" value="CXC-address"/> (Net OS-E's local interface.)

8. General Test Approach and Test Results

The test environment consisted of:

- A simulated enterprise with Avaya Aura™ System Manager, Avaya Aura™ Session Manager, Avaya Aura™ Communication Manager, Avaya phones, fax machines (Ventafax application), Avaya Aura™ Session Border Controller, and Avaya Modular Messaging.
- A laboratory version of the AT&T IP Toll Free service, to which the simulated enterprise was connected via MIS/PNT transport.

The main test objectives were to verify the following features and functionality:

- Inbound AT&T IP Toll Free service calls to Communication Manager telephones and VDNs/Vectors.
- Call and two-way talk path establishment between PSTN and Communication Manager phones via the AT&T Toll Free service..
- Basic supplementary telephony features such as hold, resume, transfer, and conference.
- G.729 and G.711 codecs.
- T.38 fax calls between the AT&T IP Toll Free service/PSTN and Communication Manager G3/SG3 fax endpoints.
- DTMF tone transmission using RFC 2833 between the AT&T IP Toll Free service/PSTN and Communication Manager automated access systems.
- Inbound AT&T IP Toll Free service calls to Communication Manager that are directly routed to stations and, if unanswered, are covered to Avaya Modular Messaging.
- Long duration calls.

The test objectives stated in **Section 8** with limitations as noted in **Section 1.3**, were verified.

9. Verification Steps

The following steps may be used to verify the configuration.

9.1. General

- Place an inbound call, answer the call, and verify that two-way talk path exists. Verify that the call remains stable for several minutes and disconnect properly.
- Place an inbound call to an agent or phone, but do not answer the call. Verify that the call covers to Modular Messaging voicemail. Retrieve the message from Modular Messaging.

9.2. Avaya Aura™ Communication Manager

The following examples are only a few of the monitoring commands available on Communication Manager. See [3] for more information.

- From the Communication Manager System Access Terminal (SAT) enter the command ***list trace tac xxx***, where ***xxx*** is a trunk access code defined for the SIP trunk to AT&T (e.g. 120).

```
list trace tac 120

Figure 98: Communication Manager *list trace tac 120* – Outbound call.

- Similar Communication Manager commands are, ***list trace station***, ***list trace vdn***, and ***list trace vector***. Other useful commands are ***status trunk*** and ***status station***.

9.3. Avaya Aura™ Session Manager

The following commands are issued from the System Manager console.

1. Verify the call routing administration on Session Manager.
 - In the left pane of the System Manager Common Console, under **Elements/Session Manager/System Tools**, click on “**Call Routing Test**”. The **Call Routing Test** page shown figure below will open.
 - In the **Call Routing Test** page, enter the appropriate parameters of the test call. The figure below shows a routing test for an inbound call from PSTN to AT&T DNIS **000001057**. The call arrives from the Session Border Controller (note that the source address of the call, **10.80.130.12**, is the “Inside” IP address of the Session Border Controller) and the calling number **3035381760**.
 - Click on “**Execute Test**”.

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

[SIP INVITE Parameters](#)

Called Party URI 000001057@avaya.com	Calling Party Address 10.80.130.12
Calling Party URI 3035381760@207.242.225.200	Session Manager Listen Port 5060
Day Of Week Monday	Time (UTC) 16:52
Called Session Manager Instance SM1	Transport Protocol TCP

[Execute Test](#)

Figure 99: Session Manager Call Routing Test Page

- The results of the test are displayed as shown in figure below. The ultimate routing decision is displayed under the heading **Routing Decisions**. The example test shows that the PSTN call to **000001057** is sent by Session Manager to the Communication Manager extension **6665310**. Under that section the **Routing Decision Process** steps are displayed (depending on the complexity of the routing, multiple pages may be generated). Verify that the test results are consistent with the expected results of the routing administered on Session Manager in **Section 4**.

Routing Decisions

Route < sip:6665310@avaya.com > to SIP Entity ATT-CLAN (10.80.111.31). Terminating Location is Location 1 Subnet 10.80.111.x.

Routing Decision Process

NRP Adaptations: no Incoming Adaptation administered.
BEGIN EMERGENCY CALL CHECK: Determining if this is a call to an emergency number.
Originating Location is AuraSBC. Using digits < 000001057 > and host < avaya.com > for routing.
NRP Dial Patterns: Found a Dial Pattern match for pattern < 0000010 > Min/Max length 9/9 and domain < avaya.com >.
NRP Routing Policies: Ranked destination NRP Sip Entities: ATT-CLAN.
NRP Routing Policies: Removing disabled routes.
NRP Routing Policies: Ranked destination NRP Sip Entities: ATT-CLAN.
END EMERGENCY CALL CHECK: This is not an emergency call.
Adapting and proxying for SIP Entity ATT-CLAN.
NRP Entity Links: Found direct link to destination. Link uses TCP to port 5060.
NRP Adaptations: ATT CLAN applied.
NRP Adaptations: P-Asserted-Identity set to sip:3035381760@avaya.com
NRP Adaptations: Request-URI set to sip:6665310@avaya.com
Route < sip:6665310@avaya.com > to SIP Entity ATT-CLAN (10.80.111.31). Terminating Location is Location 1 Subnet 10.80.111.x.

Figure 100: Call Routing Test Page -Completed

9.4. Protocol Traces

Using a SIP protocol analyzer (e.g. Wireshark), monitor the SIP traffic at the Session Border Controller “inside” interface connection to the AT&T IP Toll Free service.

1. The following are examples of inbound calls filtered for the SIP protocol.

No. .	Time	Source	Destination	Protocol	Info
78	2010-09-12 23:10:46	10.80.130.12	10.80.120.28	SIP/SDP	Request: INVITE sip:000001057@avaya.com:5060, with session
79	2010-09-12 23:10:46	10.80.120.28	10.80.130.12	SIP	Status: 100 Trying
81	2010-09-12 23:10:46	10.80.120.28	10.80.130.12	SIP/SDP	Status: 180 Ringing, with session description
747	2010-09-12 23:10:52	10.80.120.28	10.80.130.12	SIP/SDP	Status: 200 OK, with session description
759	2010-09-12 23:10:52	10.80.130.12	10.80.120.28	SIP	Request: ACK sip:10.80.111.31;transport=tcp
782	2010-09-12 23:10:52	10.80.120.28	10.80.130.12	SIP	Request: INVITE sip:3035381932@10.80.130.12:5060;transport

9.5. Avaya Aura™ Session Border Controller

The Session Border Controller provisioning can be checked by entering the command “**show -v**”. Additionally, call logs can be verified by clicking on the **Call Logs** button (not shown) on the Session Border Controller GUI and then clicking on the **Session Diagram** for the call in question. A split screen showing the call diagram and the actual call flow will be displayed. For convenience, two separate screens are shown here.

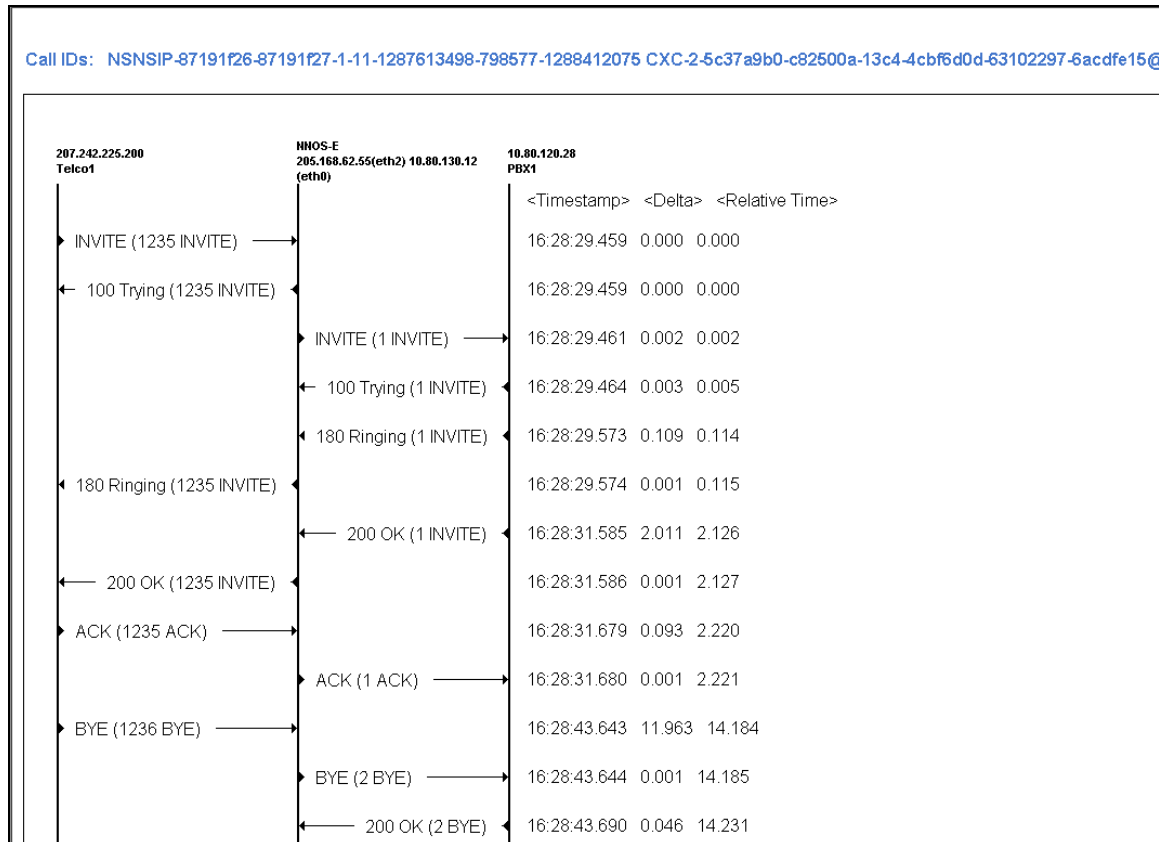

Figure 103: – Call Flow Diagram on Session Border Controller

Figure 104: – Call Flow Diagram on Session Border Controller

10. Conclusion

As illustrated in these Application Notes, Avaya Aura™ Session Manager, Avaya Aura™ Communication Manager, and the Avaya Aura™ Session Border Controller can be configured to interoperate successfully with the AT&T IP Toll Free service. This solution provides users of Avaya Aura™ Communication Manager the ability to support inbound toll free calls over an AT&T IP Toll Free SIP trunk service connection via MIS/PNT transport. These Application Notes further demonstrated that the Avaya Aura™ Session Manager Adaptation Module could be utilized to do digit manipulation for inbound calls.

Note: These Application Notes do NOT cover the AT&T IP Transfer Connect service option of the AT&T IP Toll Free service.

The reference configuration shown in these Application Notes is representative of a basic enterprise customer configuration and is intended to provide **configuration guidance** to supplement other Avaya product documentation. It is based upon formal interoperability compliance testing as part of the Avaya DevConnect Service Provider program.
