

# **Application Notes for Integrating Network Call Redirection passing User-to-User Information with Avaya Aura® 6.1 Infrastructure and AudioCodes Mediant™ 3000 Gateway for Look Ahead Interflow over SIP Trunks with Shared User-to-User Treatment - Issue 1.0**

## **Abstract**

These Application Notes describe the configuration steps required to successfully pass User-to-User Information (UII) with Network Call Redirection (NCR) utilizing SIP REFER messages via Look-Ahead Interflow (LAI) over SIP Trunks with UII Treatment as Shared for Avaya Aura® Communication Manager 6.0.1, Avaya Aura® Session Manager 6.1 and AudioCodes Mediant™ 3000 Gateway (M3K). Network Call Redirection (NCR) provides an Avaya Aura® Communication Manager call routing method between sites on a public network or a Virtual Private Network (VPN).

Information in these Application Notes has been obtained through Full Stack Test conducted at the Avaya Solution and Interoperability Test Lab.

# 1. Introduction

These Application Notes focus on a sample configuration for passing User-to-User Information (UI) with Network Call Redirection (NCR) utilizing Look-Ahead Interflow (LAI) over SIP trunks via SIP REFER messages with the UI Treatment of the associated SIP trunks set to Shared.

Network Call Redirection provides an Avaya Aura® Communication Manager call routing method between sites on a public network or a Virtual Private Network (VPN) that can reduce trunking costs. These cost reductions are particularly valuable in enterprises or multi-site call center environments where trunk costs are high.

Look-Ahead Interflow (LAI) enhances Call Vectoring for call centers with multiple ACD locations. LAI allows these centers to improve call-handling capability and agent productivity by intelligently routing calls among call centers to achieve an improved ACD load balance. The receiving switch is able to accept or deny interflowed calls sent by the sending switch.

When an incoming call arrives at an Avaya Aura® Communication Manager that has NCR feature enabled, call redirection is managed by the SIP Service Provider or VPN Switch instead of the local Avaya server. As a result, trunks that the server would otherwise retain to accomplish a trunk-to-trunk transfer are released after the call redirection takes place.

The SIP REFER message contains all information needed for Network Call Redirection. When the SIP call is answered by an agent or call vectoring event, a SIP REFER message is sent. The UI is contained within the SIP REFER message.

## 1.1 Solution Components

The following sections describes high level solution components.

### 1.1.1 AudioCodes Mediant™ 3000 Gateway

AudioCodes Mediant™ 3000 Gateway provides consolidation of Public Switched Telephone System (PSTN) facilities into SIP. AudioCodes Mediant™ 3000 is a carrier class product that offers channel scalability of up to 2016 DS0s in a compact 19"-2U chassis. AudioCodes Mediant™ 3000 provides a web-based user interface that is used for operations, administration, management, and provisioning functions. Alternatively, there is also a Linux based or Solaris based Element Management System (EMS) server that can be used to provision the AudioCodes Mediant™ 3000. These additional servers will use an EMS client to communicate with the EMS server. The EMS client resides on a Microsoft Windows based PC, and provides the graphical user interface. Recommendation is to use only one of the available provisioning tools.

## 1.1.2 Avaya Aura® Session Manager

Avaya Aura® Session Manager is a SIP proxy/routing engine that is capable of routing SIP requests throughout a network. Avaya Aura® System Manager provides administration. Avaya Aura® Session Manager provides the following functionality:

### **SIP Routing Element**

The SIP Routing Element provides site to site routing services including number/name resolution, richly manages network ingress and egress including carrier selection for least cost, time of day, load balancing, and media preferences. There may be multiple SIP Routing Elements – all share the same configuration data and some real time data.

### **Avaya Aura® Session Manager does the following:**

- Routes SIP sessions across the network with centralized routing policies.
- Centralizes SIP registrations and location services.
- Provides the gateway for the enterprise for external SIP adjuncts.

## 1.1.3 Avaya Aura® System Manager

Avaya Aura® System Manager provides centralized administration for multiple instances of Avaya Aura® Session Manager.

### **Avaya Aura® System Manager does the following:**

- Central administration of dial plans and network routing policy.
- Common user provisioning.
- Platform for centralized logs and alarms.
- Security Management.

## 1.1.4 Avaya Aura® Communication Manager

Avaya Aura® Communication Manager as an Evolution Server provides Avaya Aura® Communication Manager features for both SIP and non-SIP endpoints. It uses the full call model with Avaya Aura® Communication Manager as the only supported application. Additionally, Avaya Aura® Communication Manager provides Call Center Software functionality when a customer elects to talk with an agent. Calls are delivered to Avaya Aura® Communication Manager(s) via SIP trunks through Avaya Aura® Session Manager.

## 1.1.5 SIP Network Call Redirection and UUI Information Forwarding

Utilizing SIP trunks, SIP REFER or SIP 302 Moved Temporarily messages contain all the information needed to successfully complete an NCR transfer.

- A SIP REFER message is defined as a call that is answered whether by an agent, greeting, announcement, IVR, etc. Note in this sample configuration that vector steps using announcements or collection of digits will result in a SIP REFER message when using NCR.
- A SIP 302 Moved Temporarily message is sent when the call is not answered before performing an NCR request.

Avaya UUI information forwarding is supported with NCR when the SIP Service Provider supports UUI transport in conjunction with the specific types used by the PSTN Central Office (CO). UUI data included in Information Forwarding consists of the following Call Center Software (CCS) data:

- Adjunct Switch Application Interface (ASAI) user data
- Universal Call ID (UCID)
- Collected digits
- In-VDN time
- VDN name

## 1.2 Testing and Results

The Full Stack Testing performed demonstrates NCR over SIP Trunks with the LAI feature for Avaya Aura® Communication Manager. Testing included Avaya Aura® Communication Manager, Avaya Aura® Session Manager and AudioCodes Mediant™ 3000 Gateway elements. The testing focused on verifying the SIP REFER message contains all the information necessary to complete the NCR transfer. No "true" service provider trunking was used in the testing.

The high-level call scenario tested consists of launching a call from a simulated PSTN. The call from the simulated PSTN would come into the AudioCodes Mediant™ 3000 Gateway (M3K) over an ISDN trunk. Via the routing tables on the M3K, the call routes to Avaya Aura® Session Manager over a SIP trunk. Based on the Routing Policy defined within Avaya Aura® Session Manager the call will route to the primary Avaya Aura® Communication Manager. This Avaya Aura® Communication Manager will process the call and package UUI contents as applicable. With the NCR configuration and LAI call vectoring in place, a SIP REFER message is generated and sent to the M3K in order for NCR to occur. The first leg of the call ends and the second leg of the call will be delivered to the secondary Avaya Aura® Communication Manager. The call then follows basic call processing for delivery to a call center agent.

The testing results validate two-way talk path, UUI data is present as applicable, displaying the shared-UUI data on the agent's phone display when the UUI-Info button on the agent's phone is

pressed, correct UII data is displayed in the applicable message tracing and trunks will be seized or released as expected.

Testing presented two issues. The first issue encountered concluded that if the 96th byte of ASAI UII data is populated by the primary Avaya Aura® Communication Manager, the VDN name was blank within the ASAIUII contents. In addition to populating the 96th byte of ASAI UII, the VDN name presented on the receiving agent's phone display did not show the expected VDN name of the referring VDN from the initial Avaya Aura® Communication Manager. The second issue observed is that if the inbound call to the primary Avaya Aura® Communication Manager is delivered over a trunk with UII Treatment set to Shared and the call already has ASAI UII data, a similar result is experienced. The VDN name presented on the receiving agent's phone display did not show the expected VDN name of the referring VDN from the initial Avaya Aura® Communication Manager and the SIP REFER that was used to redirect the call to the secondary Avaya Aura® Communication Manager would not contain the expected VDN name within the User-to-User header. The SIP REFER User-to-User header value would contain "F5 00" within the ASAI UII data. F5 is the HEX identifier for VDN Name within the ASAIUII. The next byte is for the actual length of the VDN name data. Up to 15 bytes can be passed. This particular scenario resulted in byte length 00.

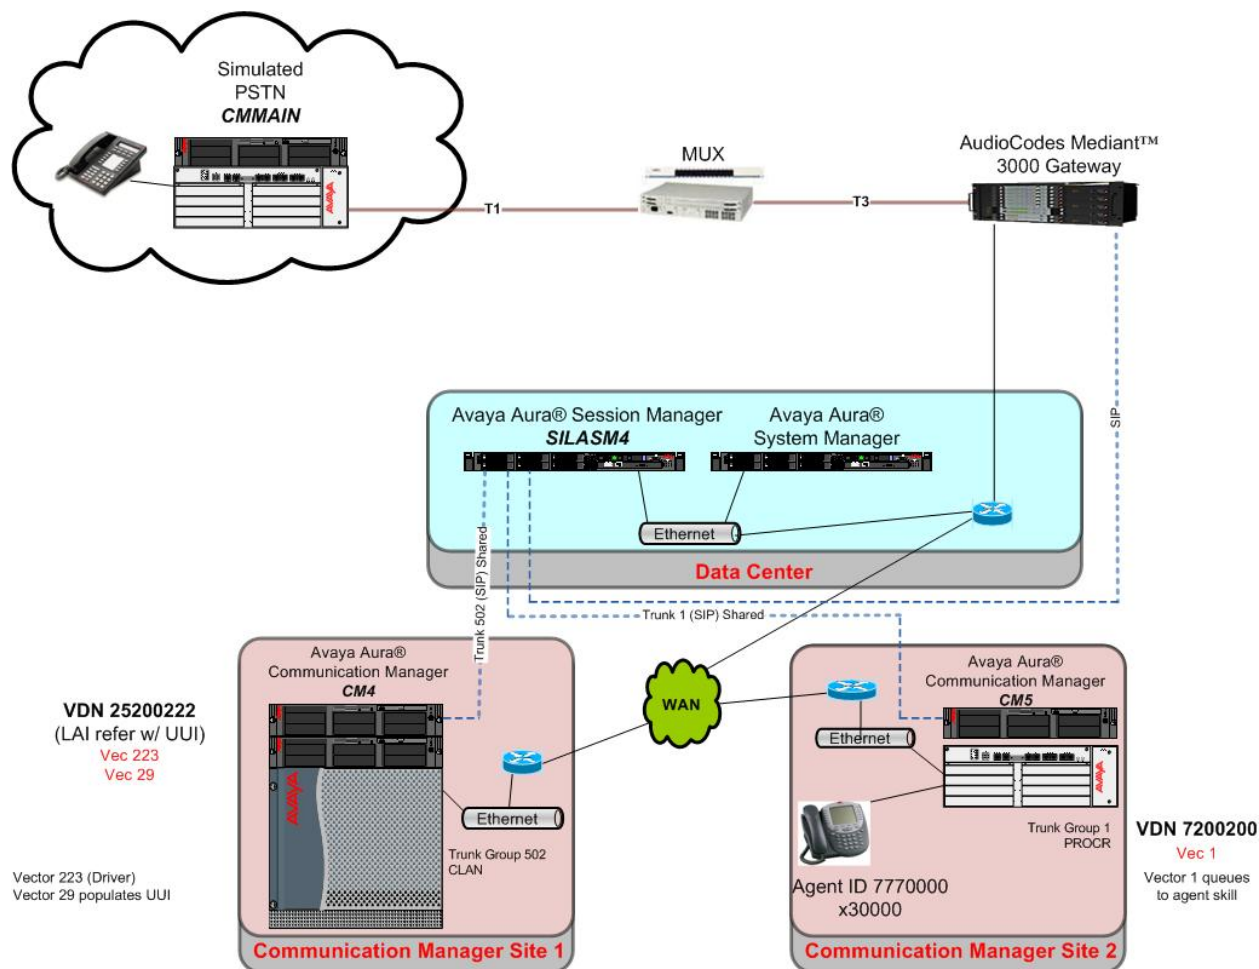

## 1.3 Assumptions

These Application Notes do not provide any configuration details for the following list of assumptions.

- Avaya Aura® Communication Manager has been installed and is operational
- Avaya Aura® System Manager has been installed and is operational
- Avaya Aura® Session Manager has been installed and is operational
- AudioCodes Mediant™ 3000 Gateway has been installed and is operational
- PSTN connectivity to the AudioCodes Mediant™ 3000 Gateway has already been established and is operational
- Adtran Patch Panel and 2800 MUX has been installed and is operational

## 1.4 Sample Configuration

The following diagram depicts the configuration used for testing.

**Figure 1**

The lab configuration consists of three (3) Avaya Aura® Communication Managers, one (1) Avaya Aura® Session Manager, one (1) AudioCodes Mediant™ 3000 Gateway, one (1) Adtran patch panel and one (1) 2800 MUX. The LAI administration for NCR is set for a multi-switch configuration.

The first Communication Manager is strictly used to simulate PSTN calls (CMMain depicted in **Figure 1**). This Communication Manager is connected to an Adtran patch panel and 2800 MUX, which connects to the AudioCodes Mediant™ 3000 Gateway (M3K) via an ISDN trunk. This Communication Manager has one station administered for generating calls into the environment.

The second Communication Manager is used for receiving the inbound call from the PSTN and to initiate the NCR LAI SIP REFER (CM4 depicted in **Figure 1**). This Communication Manager appends shared-UUI to the call as applicable. This Communication Manager is connected to

Session Manager (SILASM4 depicted in **Figure 1**) via a SIP Trunk.

The third Communication Manager will receive the redirected call and perform basic call processing in order to queue the call for delivery to an ACD Agent (CM5 depicted in **Figure 1**). This Communication Server has one station administered. This Communication Manager has one ACD Agent ID administered and assigned to a skill.

## 1.5 Detailed Call Flow

A caller on the simulated PSTN Communication Manager initiates a simulated PSTN call by dialing **925220220**. Based on the call routing administration of the simulated PSTN Communication Manager, **25220220** is passed over an ISDN trunk to the M3K.

When the call is received by the M3K, the called number prefix **25220** is matched against the M3K Routing Table. This entry will route the call to Session Manager.

The Network Routing Policy (NRP) administration on Session Manager will route the call to the SIP Entity named "silasm4\_cm4 CLAN 01a11\_5060\_TCP". This is based on the NRP administration for the dial pattern entry of **2522**. This particular SIP Entity is a CLAN board within Communication Manager (CM4 depicted in **Figure 1**). The trunk between Session Manager and the SIP Entity for Communication Manager is SIP Trunk group 502; Signaling Group 502, UII Treatment Shared.

As the call is received over trunk group 502 for Communication Manager (CM4 depicted in **Figure 1**), the incoming call is routed to VDN 25220220 with the associated vector 223.

The first step in vector 223 will wait 2 seconds hearing ringback. The next step will play an announcement. The announcement is necessary in the test configuration as the SIP REFER requires that the call is answered. The third vector step routes the call to vector 29. In vector 29 the vector variables are populated with ASAI UII data. With the administration of the VDN 25220220 variables and vector 29 populates 96 bytes of ASAI UII data.

After vector 29 processing completes, the call is sent back to vector 223 for further processing. The final step in vector 223 initiates the REFER to a VDN which resides on the receiving Communication Manager (CM5 depicted in **Figure 1**). The vector 223 step in reference for the NCR LAI SIP REFER is "route-to ~r7200200".

The sending Communication Manager (CM4 depicted in **Figure 1**) sends a SIP REFER back to the M3K via Session Manager causing the first call to be dropped after a second call is issued and established with the receiving Communication Manager (CM5 depicted in **Figure 1**). The SIP REFER will route call back over SIP Trunk Group 502 to Session Manager and onto the M3K. The M3K has a routing table entry for "7200200" that sends the call to Session Manager. The NRP administration on Session Manager will route the call to the SIP Entity Link named "silasm4 to silcm5-procr". This is based NRP administration for the dial pattern entry of 7200. This particular endpoint for the far-end SIP Entity is a PROCR interface on Communication

Manager (CM5 depicted in **Figure 1**). The trunk between Session Manager & the SIP Entity for the particular Communication Manager is SIP Trunk Group 1; Signaling Group1, UUI Treatment Shared.

As the call is received over trunk group 1 on Communication Manager (CM5 depicted in **Figure 1**) the incoming call is routed to VDN 7200200 with the associated vector 1.

Vector 1 will queue the call to Skill 1 for delivery to an ACD Agent. Actual call is delivered to Agent ID 7770000 at extension 30000.

If the receiving agent's phone has a **UUI-Info** button administered, the agent can press this button to see the ASAI UUI data passed. Depending on the type of phone, it may not display all ASAI UUI data.

The types of traces used to verify UUI information include MST traces on Avaya Aura® Communication Manager, SIP traces on Avaya Aura® Session Manager and traces on the M3K. Traces allow confirmation of UUI information, such as ASAI UUI, UCID, Collected Digits, In-VDN time and VDN name.

## 1.6 Acronyms

ACD	Automatic Call Distributor
ARS	Automatic Route Selection
ASAI	Adjunct Switch Application Interface
CCS	Call Center Software
CM	Avaya Aura® Communication Manager
CO	Central Office
COS	Class of Service
DNIS	Dialed Number Identification Service
DNS	Domain Naming Service
DS0	Digital Signaling Level Zero
DS3	Digital Signal Level 3 (Digital Signal Level 3 T-Carrier)
EAS	Expert Agent Selection
EMS	Element Management System
FAC	Feature Access Code
IP	TCP/IP Address
ISDN	Integrated Digital Services Network
LAI	Look-Ahead Interflow
M3K	AudioCodes Mediant 3000 Gateway
MST	Message Sequence Trace
MUX	Multiplexer
NCR	Network Call Redirection
NRP	Network Routing Policy
PSTN	Public Switched Telephone Network
SAT	System Access Terminal (Avaya Aura® Communication Manager Administration Interface)
SIP	Session Initiation Protocol
SM	Avaya Aura® Session Manager
SMGR	Avaya Aura® System Manager
T3	Digital Carrier Facility (equivalent to DS3)
TCP/IP	Transmission Control Protocol/Internet Protocol
TLS	Transport Layer Security
UCID	Universal Caller Identification
UUI	User-to-User Information
VDN	Vector Directory Number

## 2. Equipment and Software Validated

The following equipment and software were used for the sample configuration:

Equipment	Software
Avaya Aura® Communication Manager	R016x.00.1.510.1 - Patch 18777
Avaya Aura® Session Manager	6.1.0.0.610023
Avaya Aura® System Manager	6.1.4.0/6.1.0.4.5072 - Patch 6.1.4.113
AudioCodes Mediant™ 3000 Gateway	5.80A.060.003
Avaya one-X® IP Deskphone <ul style="list-style-type: none"><li>• 9630</li><li>• 9650</li></ul>	H.323 R3.1 SP1

## 3. Configure Avaya Aura® Communication Manager

This section provides the procedures for configuring Avaya Aura® Communication Manager. The sample environment is using a two-switch Look-Ahead Interflow configuration. The *sending* switch processes vector outflow, while the *receiving* switch processes vector inflow.

- Verify System Capabilities and Licensing †‡
- Configure IP Codec Set †‡
- Configure IP Network Region †‡
- Add Node Names and IP Addresses †‡
- Create Signaling Groups †‡
- Add/Configure Trunk Groups †‡
- Add/Configure Vector Directory Number †‡
- Add/Configure Vectors †‡
- Add/Configure Vector and VDN Variables †
- Add/Configure DialPlan Analysis †‡
- Add/Configure Skill Group †
- Add/Configure Station †
- Add/Configure Call Center Agent †

† Configuration/Capability on the *sending* switch in a two-switch Look-Ahead Interflow configuration.

‡ Configuration/Capability on the *receiving* switch in a two-switch Look-Ahead Interflow configuration.

Throughout this section the administration of Communication Manager is performed using a System Access Terminal (SAT). The following commands are entered on the system with the appropriate administrative permissions. Some administration screens have been abbreviated for clarity. These instructions assume Communication Manager has been installed, configured, licensed and provided with a functional dial plan.

## 3.1 Verify System Capabilities and Licensing

### 3.1.1 SIP Trunk Capacity Check

Use the **display system-parameters customer-options** command to verify that an adequate number of SIP trunk members are licensed for the system. The difference between the two values needs to be greater than or equal to the desired number of simultaneous SIP trunk connections. Verify highlighted value, as shown below.

**Note:** this capability is also required on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample configuration.

<b>display system-parameters customer-options</b>		Page	2 of	11
OPTIONAL FEATURES				
<b>IP PORT CAPACITIES</b>		<b>USED</b>		
Maximum Administered H.323 Trunks:		12000	0	
Maximum Concurrently Registered IP Stations:		18000	0	
Maximum Administered Remote Office Trunks:		12000	0	
Maximum Concurrently Registered Remote Office Stations:		18000	0	
Maximum Concurrently Registered IP eCons:		414	0	
Max Concur Registered Unauthenticated H.323 Stations:		100	0	
Maximum Video Capable Stations:		18000	0	
Maximum Video Capable IP Softphones:		18000	0	
<b>Maximum Administered SIP Trunks:</b>		<b>24000</b>	<b>128</b>	
Maximum Administered Ad-hoc Video Conferencing Ports:		24000	50	
Maximum Number of DS1 Boards with Echo Cancellation:		522	0	
Maximum TN2501 VAL Boards:		128	0	
Maximum Media Gateway VAL Sources:		250	0	
Maximum TN2602 Boards with 80 VoIP Channels:		128	0	
Maximum TN2602 Boards with 320 VoIP Channels:		128	0	
Maximum Number of Expanded Meet-me Conference Ports:		300	0	

### 3.1.2 AAR/ARS Routing Check

Verify that **ARS** is enabled on **Page 3** of **system-parameters customer-options** form.

### 3.1.8 Trunk-to-Trunk Check

Verify that **Trunk-to-Trunk Transfer** is enabled on **Page 1** of **system-parameters features** form.

**Note:** This feature can pose a significant security risk by increasing the risk of toll fraud and must be used with caution. To minimize the risk, a COS can be defined to allow trunk-to-trunk transfer for a specific trunk group(s). For more information regarding how to configure a Communication Manager to minimize toll fraud, see **Reference [4]**.

**Note:** this capability is also required on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample configuration.

display system-parameters features		Page 1 of 19

## 3.2 Add Node Name of Avaya Aura® Session Manager

Using the **change node-names ip** command, add the node-name and IP address of the SIP signaling interface for Session Manager, if not previously added. In this sample configuration, **silasm4** is the name of Session Manager. This same screen shows the node-name for the C-LAN interface which will be used in administering a SIP signaling-group in **Section 3.5**

**Note:** IP addresses have been partially hidden for security.

**Note:** this administration is also required on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample configuration. On the *receiving* switch the node-names ip form will use the PROCR interface as opposed to the C-LAN interface.

change node-names ip			Page 1 of 2
IP NODE NAMES			
Name	IP Address		
IP silasm4	135.9.88.X		
IP sqa8730clan2A	135.9.88.X		

## 3.3 Configure Codec Type

Using the **change ip-codec-set n** command where n is the next available number. In the sample configuration G.711MuLaw was the preferred codec.

Enter the following values:

- **Audio Codec - G.711** is entered as the first choice. Optionally enter in a secondary codec such as **G.729A**.

**Note:** this administration is also required on the receiving switch that processes vector inflow for the two-switch Look-Ahead Interflow sample configuration. On the receiving switch the ip-codec will include the same values.

change ip-codec-set 4				Page 1 of 2
IP Codec Set				
Codec Set: 1				
Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size(ms)	
1: G.711MU	n	2	20	
2: G.729A	n	2	20	
3:				
Media Encryption				
1: none				

## 3.4 Configure IP Network Regions

In the sample configuration calls to/from Session Manager for the sending Communication Manager (CM4 depicted in **Figure 1**) will be viewed as calls to/from ip-network-region **9**. The sending Communication Manager and the CLAN endpoint for the SIP trunk are in ip-network-region **1**. The sending Communication Manager also has VoIP resources in ip-network-region **1**. To enable communication between the two network regions requires additional administration of the **ip-network-region** and **signaling-group** forms as shown in the next few sections.

**NOTE:** these Application Notes do not cover the administration of the IP Network Region for VoIP resources. Assumption is the IP Network Region for VoIP resources already exists.

### 3.4.1 Configure IP Network Region for Session Manager

Using the command **change ip-network-region 9**, enter the following values

- **Authoritative Domain** **dr.avaya.com** is entered. This is the authoritative domain for the environment.
- **Codec Set** **4** is entered. This is IP Codec set created in **Section 3.3**
- **Intra-region IP-IP Direct Audio** **yes**
- **Inter-region IP-IP Direct Audio** **yes**

**Note:** this administration is also required on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample configuration as both switches have similar network region design.

<b>change ip-network-region 9</b>	IP NETWORK REGION	Page 1 of 20

9	4											all						

## 3.5 Add SIP Signaling Group

Using the command **add signaling-group x** where x is an available signaling group number, for one of the SIP trunks to Session Manager, and fill in the indicated fields. In the sample configuration, trunk group **502** and signaling group **502** were used to connect to Session Manager. Default values can be used for the remaining fields.

- **Group Type:** sip
- **Transport Method:** tcp
- **IMS Enabled?:** n
- **Peer Detection Enabled?:** y
- **Peer Server:** Use default value. **Note:** default value is replaced with "SM" after SIP trunk to Session Manager is established
- **Near-end Node Name:** CLAN board node name from **Section 3.2**
- **Far-end Node Name:** Session Manager node name from **Section 3.2**
- **Near-end Listen Port:** 5060
- **Far-end Listen Port:** 5060
- **Far-end Network Region:** IP-network-region from **Section 3.4.1**
- **Far-end Domain:** Authoritative Domain from **Section 3.4.1**
- **Enable Layer 3 Test:** y

**Note:** this administration is also required for the signaling group used on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample. On the *receiving* switch the PROCR node-name is used as opposed to the C-LAN node-name.

```
add signaling-group 502
                                SIGNALING GROUP
Group Number: 502              Group Type: sip
IMS Enabled? n                Transport Method: tcp
    Q-SIP? n                                SIP Enabled LSP? n
    IP Video? n                        Enforce SIPS URI for SRTP? y
Peer Detection Enabled? y  Peer Server: SM

Near-end Node Name: sqa8730clan2A      Far-end Node Name: silasm4
Near-end Listen Port: 5060              Far-end Listen Port: 5060
                                      Far-end Network Region: 9
                                      Far-end Secondary Node Name:

Far-end Domain: dr.avaya.com

                                Bypass If IP Threshold Exceeded? n
Incoming Dialog Loopbacks: eliminate    RFC 3389 Comfort Noise? n
    DTMF over IP: rtp-payload            Direct IP-IP Audio Connections? y
Session Establishment Timer(min): 3      IP Audio Hairpinning? n
    Enable Layer 3 Test? y                Initial IP-IP Direct Media? n
H.323 Station Outgoing Direct Media? n  Alternate Route Timer(sec): 6
```

(1) TCP was used for the sample configuration for testing and debugging purposes. However, TLS would typically be used in production environments.

(2) If any call originating from the SIP phone is not expected to be answered within 3 minutes such would happen if the is made to a VDN and agents are not available within 3 minutes, this value may need to be increased.

## 3.6 Add SIP Trunk Group

Add the corresponding trunk group controlled by this signaling group using the command **add trunk-group x** where x is an available trunk group number and fill in the indicated fields.

- **Group Type:** sip
- **Group Name:** A descriptive name.
- **Outgoing Display:** y
- **TAC:** An available trunk access code.
- **Service Type:** tie
- **Signaling Group:** The number of the signaling group added in **Section 3.5**
- **Number of Members:** The number of SIP trunks to be allocated to calls routed to Session Manager

**Note:** this administration is also required for the trunk group used on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample.

```
add trunk-group 502                                     Page 1 of 22
                                     TRUNK GROUP

Group Number: 502                      Group Type: sip          CDR Reports: y
Group Name: SIP TG to silasm4 - Shared COR: 1          TN: 1          TAC: #502
Direction: two-way                    Outgoing Display? y
Dial Access? n                        Night Service:
Queue Length: 0
Service Type: tie                      Auth Code? n
                                     Member Assignment Method: auto
                                     Signaling Group: 502
                                     Number of Members: 10
```

Once the add command is completed, trunk members will be automatically generated based on the value in the **Number of Members** field.

On **Page 2**, set the **Preferred Minimum Session Refresh Interval** to **1200**.

**Note:** To avoid extra SIP messages, all SIP trunks connected to Session Manager should be configured with a minimum value of 1200.

```
add trunk-group 502                                     Page 2 of 22
    Group Type: sip

DSN Term? N	

## 3.7 Administering Public/Unknown Numbering Format

Administer a Calling Party Number (CPN) Prefix for each Vector Directory Number (VDN) that maps to a vector used to place LAI calls.

To enable endpoints to dial extensions defined in Communication Manager, use the command **change public-unknown-numbering x** where x is the number used to identify the public number plan. The trunk group used in the example below is the Trunk Group added in **Section 3.6**.

- **Ext Len:** Enter the extension length allowed by the dial plan
- **Ext Code:** Enter leading digit (s) from extension number
- **Trunk Grp:** Enter the SIP Trunk Group number for the SIP trunk between Communication Manager and Session Manager
- **CPN Prefix:** Leave blank unless an enterprise canonical numbering scheme is defined in Session Manager. If so, enter the appropriate prefix.

change public-unknown-numbering 2					Page 1 of 2
NUMBERING - PUBLIC/UNKNOWN FORMAT					
Ext Len	Ext Code	Trk Grp(s)	CPN Prefix	Total CPN Len	
7	25220220	502		7	Total Administered: 7 Maximum Entries: 9999

## 3.8 Administer Incoming Vector to Initiate the LAI SIP REFER on Sending Communication Manager

Administer the incoming vector that will initiate the LAI SIP REFER. This vector is associated to the initial incoming VDN in **Section 3.10**. The first primary step of vector processing will play an announcement in order to force a NCR LAI SIP REFER. Vector processing continues onto vector 29 in order to populate ASAI UII data. Once vector 29 completes, the call is returned for further vector processing. The NCR LAI SIP REFER is performed once the **route-to number ~r** step is executed. In this sample configuration the call redirects to 7200200, a VDN on the receiving Communication Manager (CM5 as depicted in **Figure 1**).

To create the vector use the command **change vector x** where x is the number of the vector. The sample vector below plays an announcement, then utilizes vector 29 to populate ASAI UII data, followed by performing the SIP REFER.

<b>change vector 223</b>	Page 1 of 6
CALL VECTOR	
Number: 223	Name: Driver
Multimedia? n	Attendant Vectoring? n
Basic? y	EAS? y
Prompting? y	LAI? y
Variables? y	3.0 Enhanced? y
01 wait-time	2 secs hearing ringback
02 announcement	3010
03 goto vector	29 @step 1 if unconditionally
04 route-to	number ~r7200200
05	

### 3.9 Administering the Vector to Populate ASAI UII on Sending Communication Manager

Administer the vector to populate simulated ASAI UII data. This vector is associated with the vector created in **Section 3.8**.

To create the vector use the command **change vector x** where x is the number of the vector. The sample vector below uses the VDN Variables in **Section 3.10** and Vector Variables in **Section 3.14** to create the 96 bytes of simulated ASAI UII data. As vector steps 1 thru 5 build the first 80 bytes of ASAI UII from the VDN Variables, step 6 will add the remaining 16 bytes of ASAI UII data for a total of 96 bytes from the Vector Variables table.

<b>change vector 29</b>	Page 1 of 6

06 set	ZG = none CATR 1234567890123456
07 return	

## 3.10 Administering the Vector Directory Number (VDN) for NCR LAI SIP REFER with Shared UII Data on Sending Communication Manager

Administer the VDN for populating shared UII. This VDN uses the vector from **Section 3.8**.

Create the VDN using the command **add vdn x** where x is the extension of the VDN.

- **Extension:** Enter the extension allowed by the dial plan
- **Name:** Enter a descriptive name
- **Destination:** Enter the initial incoming vector that was created in **Section 3.8**
- **Allow VDN Override:** Enter **n** to disable VDN Override

```
add vdn 25200222                                     Page 1 of 3
VECTOR DIRECTORY NUMBER

      Extension: 25200222
      Name*: NCR LAI UII
      Destination: Vector Number                223
Attendant Vectoring? n
Meet-me Conferencing? n
      Allow VDN Override? n
      COR: 1
      TN*: 1

VDN of Origin Annc. Extension*:
      1st Skill*:
      2nd Skill*:
      3rd Skill*:
* Follows VDN Override Rules
```

On **Page 3** of the **vdn** form, assign digits to the VDN Variables in order to simulate ASAI UII data. Based on the protocol up to 96 bytes of ASAI UII can be passed. The first 80 bytes of ASAI UII are created using the VDN Variables. The remaining bytes will be appended based on vector programming.

- **V1:** Enter 16 characters to simulate ASAIUII
- **V2:** Enter 16 characters to simulate ASAIUII
- **V3:** Enter 16 characters to simulate ASAIUII
- **V4:** Enter 16 characters to simulate ASAIUII
- **V5:** Enter 16 characters to simulate ASAIUII

## 3.11 Administer Initial Incoming Vector on Receiving Communication Manager

Administer the incoming vector that will queue the call to a call center agent. This vector is associated to the initial incoming Vector Directory Number (VDN) in **Section 3.12**. The sample vector will queue the call to a call center agent.

Using the command **change vector x** where x is the number of the vector to create. Add the basic steps below. For **step 2**, use the skill group number from **Section 3.15**.

change vector 1		CALL VECTOR				Page	1 of	6
Number: 1		Name: queue-to NCRUII

## 3.12 Administer the initial incoming Vector Directory Number (VDN) on Receiving Communication Manager

Administer the initial incoming VDN. This VDN uses the vector from **Section 3.11**

Using the command **add vdn x** where x is the extension of the VDN to create and enter the following values:

- **Extension:** Enter the extension allowed by the dial plan
- **Name:** Enter a descriptive name
- **Destination:** Enter Vector Number created in **Section 3.11**

```
add vdn 720-0200                                     Page 1 of 3
                                                    VECTOR DIRECTORY NUMBER
                                                    Extension: 720-0200
                                                    Name*: CM5 VDN Manual Test 7200200

### 3.13 Administer Variables for Vectors on Sending Communication Manager

Using the command **change variables** add the applicable variables.

- **Variable ZA:** bytes 1-16 of ASAIUUI as referenced in **Section 3.9**
- **Variable ZB:** bytes 17-31 of ASAIUUI as referenced in **Section 3.9**
- **Variable ZD:** bytes 32-47 of ASAIUUI as referenced in **Section 3.9**
- **Variable ZE:** bytes 48-63 of ASAIUUI as referenced in **Section 3.9**
- **Variable ZF:** bytes 64-80 of ASAIUUI as referenced in **Section 3.9**
- **Variable ZG:** bytes 81-96 of ASAIUUI as referenced in **Section 3.9**

**Note:** the actual variables for vectors form has a total 39 pages. The form depicted below was consolidated to single screen shot for reference.

change variables							
VARIABLES FOR VECTORS							
Var	Description	Type	Scope	Length	Start	Assignment	VAC
ZA	ASAI 1-16	asaiuui	L	16	1		
ZB	ASAI 17-32	asaiuui	L	16	17		
ZD	ASAI 33-48	asaiuui	L	16	33		
ZE	ASAI 49-64	asaiuui	L	16	49		
ZF	ASAI 65-80	asaiuui	L	16	65		
ZG	ASAI 81-96	asaiuui	L	16	81		

## 3.14 Administer Dial Plan Analysis

In the screenshot below, the following entries are added by using the command **change dialplan analysis**:

- **Dialed String:** **252** is for extensions local to CM. Call type is **ext**  
**8** is for the total length of the digit string  
**\*** is for feature access codes local to CM. Call Type is **fac**  
**3** is for the total length of the digit string for the **fac**  
**#** is for dialed access codes local to CM. Call Type is **dac**  
**5** is for the total length of the digit string for the **dac**

**Note:** this administration is also required on the *receiving* switch that processes vector inflow for the two-switch Look-Ahead Interflow sample. The sample configuration uses parameters that are applicable for the *receiving* switch. The difference is the dialed string is **7** with a total length of **7** on the *receiving* switch. All other values remain the same.

change dialplan analysis			DIAL PLAN ANALYSIS TABLE							Page 1 of 12
			Location: all							Percent Full: 4
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type		
252	8	ext								
*	3	fac								
#	4	dac								

## 3.15 Administer Agent Skill Group on Receiving Communication Manager

Administer the agent skill group. Using the command **add hunt x** where x is the skill group number and enter the following values:

- **Group Name:** Enter descriptive name for the agent skill
- **Group Extension:** Enter the lead hunt extension for the skill
- **ACD:** y
- **Queue:** y
- **Vector:** y

add hunt-group 1		Page 1 of 4

## 3.16 Configure Answering Station on Receiving Communication Manager

Add a station to the receiving Communication Manager for the call center agent.

Using the command **add station x** where x is a valid extension number defined in the system. The sample configuration uses a type 9650 h.323 phone. Enter the following values for **Page 1** of the **add station** form:

- **Phone Type:** Set to 9650
- **Name:** Display name for user
- **Security Code:** Numeric password used when the station is registered.

<b>add station 30000</b>	STATION	Page	1 of	5
<b>Extension:</b> 30000	Lock Messages?	n	BCC:	0
<b>Type:</b> 9650	Security Code:	123456	TN:	1
Port: S00022	Coverage Path 1:		COR:	1
<b>Name:</b> Station 30000 Agent 7770000	Coverage Path 2:		COS:	1
	Hunt-to Station:			
STATION OPTIONS

## 3.17 Configure Agent ID on Receiving Communication Manager

For the sample configuration add an agent id that is associated to the skill group on Communication Manager in order to receive ACD calls.

Using the command **add agent-loginID x** where x is a valid extension number for an agent id defined in the system. Fill in the indicated fields. Enter the following values on **Page 1** of the **agent-loginID** form:

- **Name:** Display name for agent
- **Password:** Numeric password used when the agent logs into a station.

<b>add agent-loginID 7770000</b>		Page 1 of 3

## 3.18 Configure Feature Access Codes on Receiving Communication Manager

For the sample configuration administer feature access codes for the call center agents.

Using the command **change feature-access-codes**, administer valid values for the system.

On **Page 5**, enter following values on the **change feature-access-codes** form:

- **Auto-In Access Code:** FAC to staff in the agent ID to their respective skill.
- **Login Access Code:** FAC to login the agent ID to their respective skill.
- **Logout Access Code:** FAC to logout the agent ID from their skill.

## 4. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. These instructions assume System Manager and Session Manager are already installed and functioning properly. Configuration is accomplished by accessing the browser-based GUI of System Manager, using the URL “<http://<FQDN>/SMGR>”, where “<FQDN>” is the Fully Qualified Domain Name of System Manager. Log in to System Manager with the appropriate credentials. The menu below is displayed. Select the link for **Routing** under **Elements**.

Avaya Aura™ System Manager 6.1

[Help](#) | [About](#) | [Change Password](#) | [Log off](#)

[Home](#)

The screenshot shows the main menu of Avaya Aura System Manager 6.1. It features three main columns: **Users**, **Elements**, and **Services**. The **Elements** column contains a list of sub-menus, with **Routing** (Network Routing Policy) highlighted by a red circle. Other sub-menus include Application Management, Communication Manager, Conferencing, Inventory, Messaging, Presence, SIP AS 8.1, and Session Manager. The **Services** column includes Backup and Restore, Configurations, Events, Licenses, Replication, Scheduler, Security, and Templates.

The menu below is displayed. The sub-menus in the left column will be used for configuration.

Avaya Aura™ System Manager 6.1

[Routing](#) [Home](#)

The screenshot shows the 'Routing' configuration page in Avaya Aura System Manager 6.1. The left sidebar contains a tree view with 'Routing' selected, showing sub-items like Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area displays the 'Introduction to Network Routing Policy' page, which includes a list of steps for configuring the network routing policy:

- Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).
- Step 2: Create "Locations"
- Step 3: Create "Adaptations"
- Step 4: Create "SIP Entities"
  - SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
  - Create all "other SIP Entities" (Session Manager, CM, SIP/ PSTN Gateways, SIP Trunks)
  - Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"
- Step 5: Create the "Entity Links"
  - Between Session Managers
  - Between Session Managers and "other SIP Entities"
- Step 6: Create "Time Ranges"

## 4.1 Specify SIP Domains

Configure the SIP Domain appropriately. Select **Domains** from the left hand window. Click **New**.

## 4.2 Add Locations

Locations are used to identify logical and/or physical locations where SIP Entities reside, for purposes of bandwidth management. In the sample environment, two separate locations were added. The locations specified are based on the network ID. The first location is for the *sending* Communication Manager subnet 135.9.88 (CM4 depicted in **Figure 1**). The second location is for the *receiving* Communication Manager subnet 135.9.228 (CM5 depicted in **Figure 1**).

Select **Locations** and click **New** (not shown). In the **General** section, under **Name** add a descriptive name. Under **Notes** add a brief description. Under **Location Pattern** click **Add** and enter the IP address pattern. Click **Commit** to save.

### Add 135.9.88 Location:

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar has a tree view with 'Locations' selected. The main content area is titled 'Home / Elements / Routing / Locations- Location Details'. The 'General' section has a 'Name' field with '135.9.88' and an empty 'Notes' field. The 'Overall Managed Bandwidth' section has 'Managed Bandwidth Units' set to 'Mbit/sec'. The 'Per-Call Bandwidth Parameters' section has 'Maximum Multimedia Bandwidth (Intra-Location)' and 'Maximum Multimedia Bandwidth (Inter-Location)' set to 'Kbit/Sec', and 'Minimum Multimedia Bandwidth' set to '64 Kbit/Sec'. The 'Location Pattern' section has an 'Add' button and a table with one item: '135.9.88.\*'. The 'Commit' button is highlighted in the top right.

## 4.3 Add the AudioCodes Mediant™ 3000 Gateway SIP Entity

Configure the SIP Entity for the AudioCodes Mediant™ 3000 Gateway (M3K). Select **Routing** and select **SIP Entities**. Click **New** (not shown). In the **General** Section, add the following:

- **Name:** Add an identifier for the M3K
- **FQDN or IP Address:** Enter the IP Address of M3K
- **Type:** Select **Gateway**
- **Notes:** Add a brief description
- **Location:** From the drop down select the *first* Location added in **Section 4.2**
- **Time Zone:** From the drop down select the appropriate time zone

Click **Commit** to save.

**Note:** IP addresses have been partially hidden for security.

Avaya Aura® System Manager 6.1

[Help](#) | [About](#) | [Change Password](#) | [Log off](#)

The screenshot displays the Avaya Aura System Manager 6.1 interface. On the left, a sidebar menu shows 'SIP Entities' selected. The main content area is titled 'SIP Entity Details' and includes a 'Commit' button highlighted with a red box. The 'General' section contains the following fields:

- Name:** m3kTPglobal
- FQDN or IP Address:** 135.9.88
- Type:** Gateway
- Notes:** M3K Global TP IP address
- Adaptation:** (dropdown menu)
- Location:** 135.9.88
- Time Zone:** America/Denver

Below these fields, there are checkboxes for 'Override Port & Transport with DNS SRV' and 'SIP Timer B/F (in seconds): 4'. A 'Credential name' field and a 'Call Detail Recording' dropdown (set to 'none') are also present. The 'SIP Link Monitoring' section at the bottom includes:

- SIP Link Monitoring:** Link Monitoring Enabled
- Proactive Monitoring Interval (in seconds):** 900
- Reactive Monitoring Interval (in seconds):** 120
- Number of Retries:** 1

## 4.4 Add the CLAN interface for Avaya Aura® Communication Manager as a SIP Entity

Configure the SIP Entity for the sending Communication Manager (CM4 as depicted in **Figure 1**). Select **Routing** and select **SIP Entities**. Click **New** (not shown). In the **General** Section, add the following:

- **Name:** Add an identifier for Communication Manager
- **FQDN or IP Address:** Enter the IP Address of Communication Manager CLAN
- **Type:** Select **CM**
- **Notes:** Add a brief description
- **Location:** From the drop down select the *first* Location added in **Section 4.2**
- **Time Zone:** From the drop down select the appropriate time zone

Click **Commit** to save.

**Note:** IP addresses have been partially hidden for security.

## 4.6 Add Avaya Aura® Session Manager as a SIP Entity

One of the first steps in properly setting up Session Manager and System Manager is to add Session Manager as a SIP Entity. Generally, this is done during the initial installation of Session Manager and System Manager. Select **Routing** and select **SIP Entities**. Click **New** (not shown). In the **General** Section, add the following:

- **Name:** Add an identifier for Session Manager
- **FQDN or IP Address:** Enter the IP Address of Session Manager SIP interface
- **Type:** Select **Session Manager**
- **Notes:** Add a brief description
- **Location:** From the drop down select the *first* Location added in **Section 4.2**
- **Time Zone:** From the drop down select the appropriate time zone

Click **Commit** to save.

**Note:** IP addresses have been partially hidden for security.

The screenshot displays the Avaya Aura System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help | About | Change Password | Log off". The main navigation menu on the left lists various configuration areas, with "SIP Entities" highlighted. The breadcrumb trail at the top of the content area reads "Home / Elements / Routing / SIP Entities- SIP Entity Details". The "SIP Entity Details" form is shown in the "General" tab. A red rectangular box highlights the following fields: "Name" (containing "silas m4"), "FQDN or IP Address" (containing "135.9.88"), "Type" (set to "Session Manager"), "Notes" (empty), "Location" (set to "135.9.88"), "Outbound Proxy" (empty), "Time Zone" (set to "America/Denver"), and "Credential name" (empty). To the right of the form are "Commit" and "Cancel" buttons. Below the form, the "SIP Link Monitoring" section shows a dropdown menu set to "Use Session Manager Configuration".

## 4.7 Define an Entity Link for the AudioCodes Mediant™ 3000 Gateway

Configure Entity Link for the M3K. Select **Routing** and select **Entity Links**. Click New (not shown). In the **Entity Links** section, add the following:

- **Name:** Enter an identifier for M3K
- **SIP Element 1:** From dropdown, select the SIP Entity added in **Section 4.6** for Session Manager
- **Protocol:** From dropdown select the required protocol
- **Port:** Enter the correct port for Session Manager
- **SIP Element 2:** From dropdown, select the SIP Entity added in **Section 4.3** for M3K
- **Port:** Enter the correct port for M3K
- **Trusted:** Ensure the ticked box is clicked
- **Notes:** Add a brief description

Click **Commit** to save.

## 4.14 Define Dial Plan for Sending Avaya Aura® Communication Manager

Configure the Dial Plan pattern. Select **Routing** and select **Dial Patterns**. Click **New** (not shown). In the **General** section, add the following:

- **Pattern:** 2522
- **Min:** 8
- **Max:** 8
- **Emergency Call:** Select if applicable
- **SIP Domain:** Select the SIP Domain added in **Section 4.1**
- **Notes:** Brief description

The screenshot shows the Avaya Aura System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help", "About", "Change Password", and "Log off". Below the navigation bar, there are tabs for "Routing" and "Home". The left sidebar contains a tree view with the following items: "Routing", "Domains", "Locations", "Adaptations", "SIP Entities", "Entity Links", "Time Ranges", "Routing Policies", "Dial Patterns" (highlighted with a red box), "Regular Expressions", and "Defaults". The main content area is titled "Home / Elements / Routing / Dial Patterns- Dial Pattern Details". It features a "Dial Pattern Details" section with a "General" tab. The form fields are as follows: "Pattern" (text box with "2522"), "Min" (text box with "8"), "Max" (text box with "8"), "Emergency Call" (checkbox), "SIP Domain" (dropdown menu with "dr.avaya.com"), and "Notes" (text box with "for NCR/UUI Config (Shared)"). There are "Commit" and "Cancel" buttons at the bottom right of the form.

In the **Originating Locations and Routing Policies** section click **Add** (not shown).

In the **Originating Location** section, select the appropriate location. In the **Routing Policies** section, select the appropriate policy for routing. Click the **Select** button.

## 4.15 Define Dial Plan for Receiving Avaya Aura® Communication Manager

Configure the Dial Plan pattern. Select **Routing** and select **Dial Patterns**. Click **New** (not shown). In the **General** section, add the following:

- **Pattern:** 72002
- **Min:** 7
- **Max:** 7
- **Emergency Call:** Select if applicable
- **SIP Domain:** ALL
- **Notes:** Brief description

The screenshot shows the Avaya Aura® System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura® System Manager 6.1", and links for "Help", "About", "Change Password", and "Log off". Below the navigation bar, there are tabs for "Routing" and "Home". The left sidebar contains a tree view with the following items: "Routing", "Domains", "Locations", "Adaptations", "SIP Entities", "Entity Links", "Time Ranges", "Routing Policies", "Dial Patterns" (highlighted with a red box), "Regular Expressions", and "Defaults". The main content area is titled "Home / Elements / Routing / Dial Patterns- Dial Pattern Details". It features a "Dial Pattern Details" section with a "General" tab. The form fields are as follows: "Pattern" (72002), "Min" (7), "Max" (7), "Emergency Call" (checkbox), "SIP Domain" (-ALL-), and "Notes" (silcm5-procr NCR/UII). Each of these fields is highlighted with a red box. At the bottom of the form, there is a section titled "Originating Locations and Routing Policies" with "Add" and "Remove" buttons. The "Add" button is highlighted with a red box. In the top right corner of the form, there are "Commit" and "Cancel" buttons, and a "Help ?" link.

In the **Originating Locations and Routing Policies** section click **Add**.

In the **Originating Location** section, select the appropriate location. In the **Routing Policies** section, select the appropriate policy for routing. Click the **Select** button.

## 5. Configure the AudioCodes Mediant™ 3000 Gateway

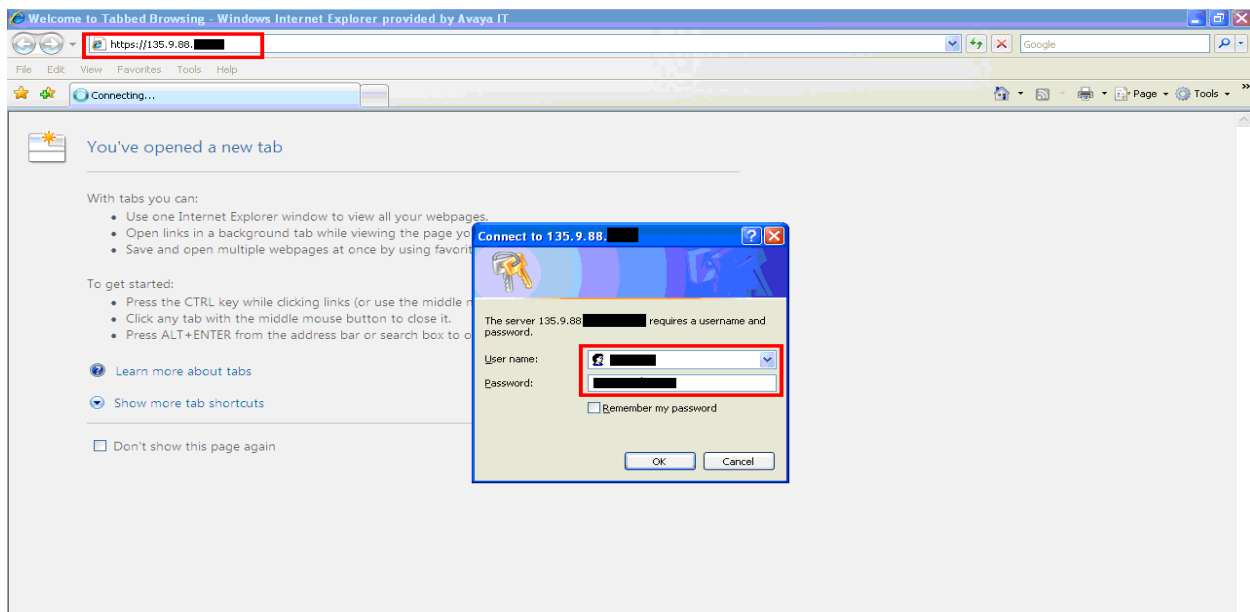

This section provides the procedures for configuring M3K using the web based graphical user interface. The procedures include the following areas:

- Select all configurable parameters
- Setting SIP Protocols and ports
- Setup Codec preferences
- Add a SIP Trunk Group
- Setup Tel to IP routing
- Setup Internal DNS Table
- Setup Tel-to-IP Alternative Routing

These Application Notes assume the M3K is already installed and functioning properly. See the reference documents listed in **Section 8** for the AudioCodes Mediant™ 3000 Gateway documents.

Log in to the M3K via an internet browser using the IP address or FQDN of the M3K with a login name having administrative rights.

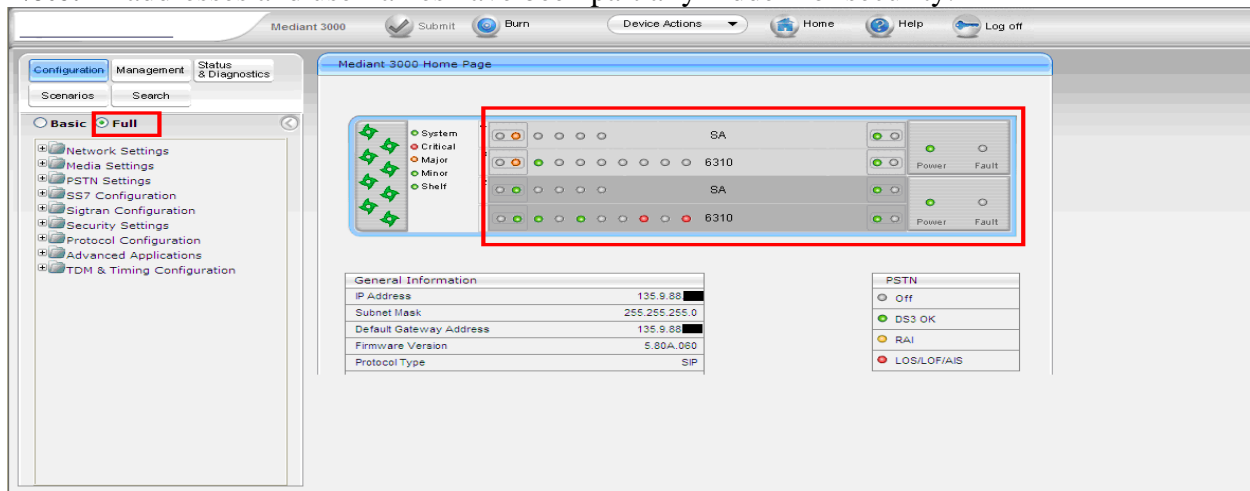

**Note:** IP addresses and usernames have been partially hidden for security.

## 5.1 Display all configurable parameters

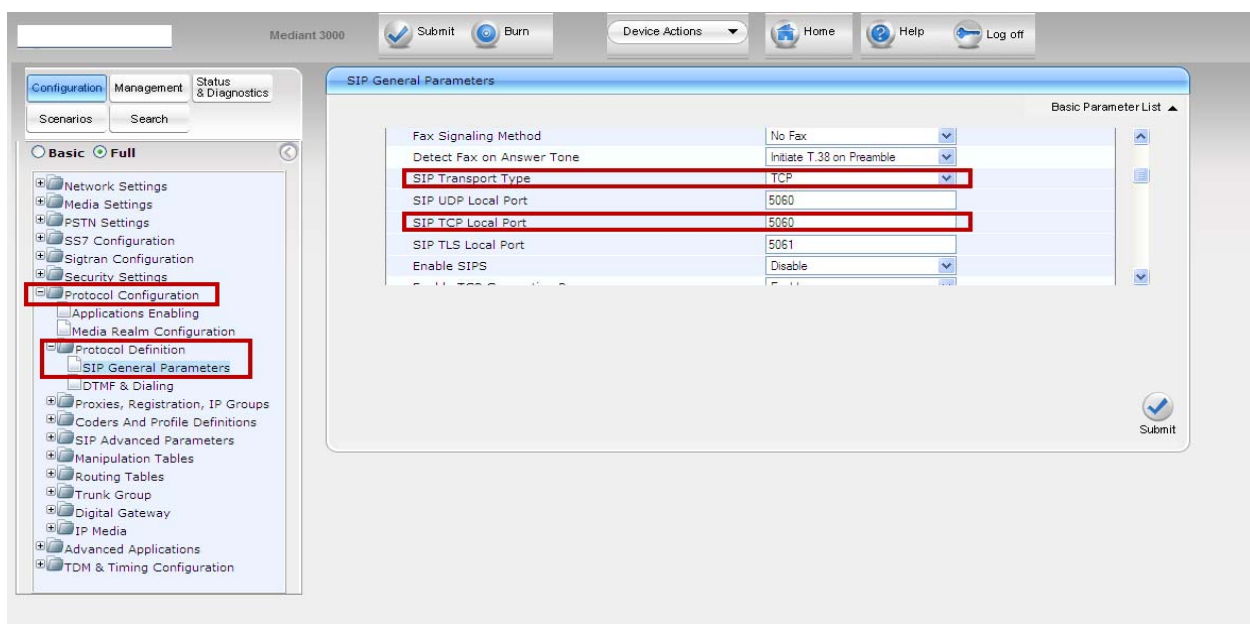

The Mediant 3000 Home Page will be displayed. To display all configurable parameters, select **Full** in the left pane. In the screenshot below, both TP6310 and SA boards are shown.

**Note:** IP addresses and usernames have been partially hidden for security.

## 5.2 Set SIP Protocols and Ports

Double-click on **Protocol Configuration**, expand **Protocol Definition** and select **SIP General Parameters**. This will display the SIP General Parameters in the right pane. Scroll down and set the **SIP Transport Type** and **SIP TCP Local Port** to the values administered in **Section 4.7**

Scroll down further and set the **SIP Destination Port** and **Use user=phone in SIP URL** fields.

## 5.5 Setup Tel to IP Routing to Route Calls between Avaya Aura® Session Manager and Receiving Communication Manager

Expand **Protocol Configuration** and **Routing Tables** in the left pane. Select **Tel to IP Routing**. The **Tel to IP Routing** table is displayed in the right pane. Select the desired row of the table and enter routing information:

- **Src. Trunk Group ID:** \*
- **Dest. Phone Prefix:** 7200200
- **Source Phone Prefix:** \*
- **Dest. IP Address:** IP or FQDN of Session Manager
- **Port:** Port administered from **Section 4.7**
- **Transport Type:** Transport Protocol administered from **Section 4.7**

**Note:** IP addresses have been partially hidden for security.

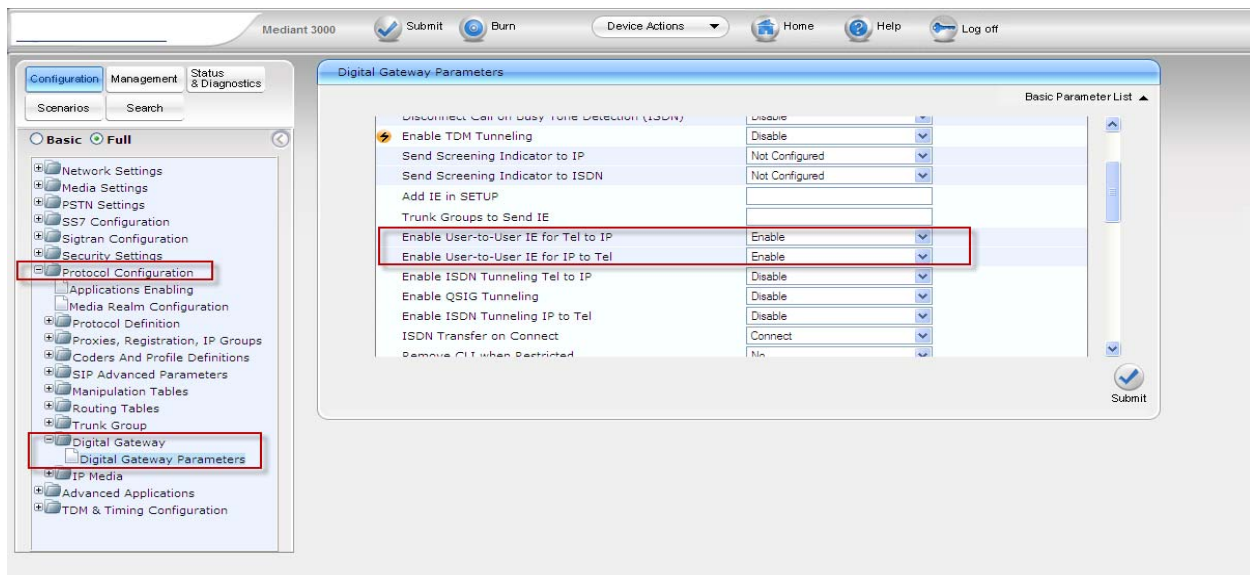

Click **Submit** and then **Burn**.

## 5.6 Verify the Protocol Configuration

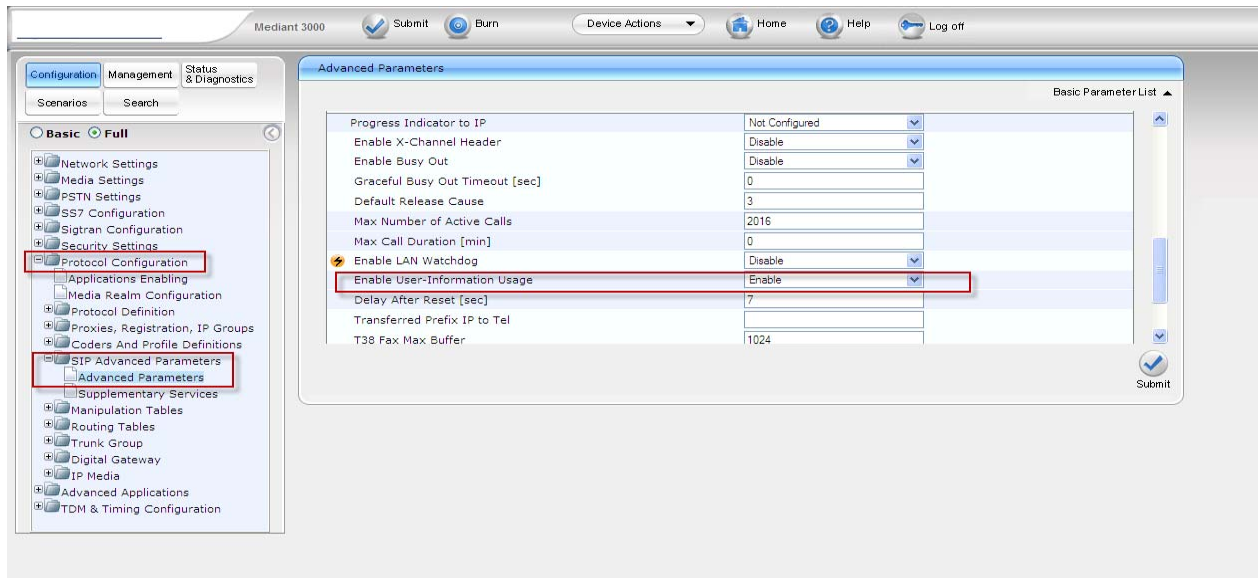

### 5.6.1 Verify the Digital Gateway Parameters

Expand **Protocol Configuration** and **Digital Gateway** in the left pane. Select **Digital Gateway Parameters**. The **Digital Gateway Parameters** table is displayed in the right pane. Scroll down and verify **Enable User-to-User IE for Tel to IP** and **Enable User-to-User IE for IP to Tel** are both enabled.

## 5.6.2 Verify the SIP Advanced Parameters

Expand **Protocol Configuration** and **SIP Advanced Parameters** in the left pane. Select **Advanced Parameters**. The **Advanced Parameters** table is displayed in the right pane. Scroll down and verify **Enable User-Information Usage** is enabled.

## 6. Verification Steps

### 6.1 Verify AudioCodes Mediant™ 3000 Gateway Configuration

- Log into the web interface and click **Statistics & Diagnostics** from the left pane. Expand **Status & Diagnostics** (not shown) and select **Message Log**.
- Place initial test customer call and verify proper M3K routing by inspecting the SIP messages and SIP message sequence.

### 6.2 Verify Avaya Aura® Session Manager Configuration

- Log in to System Manager web interface. If **SIP Monitoring** is **enabled**, select **Session Manager** from the left pane. Select **SIP Entity Monitoring** from the sub-menu. Drill down into the applicable entity to verify status.

The following example shows the **Connection Status** and **Link Status** as **UP** for Avaya Aura® Session Manager

The screenshot displays the Avaya Aura System Manager 6.1 web interface. The left sidebar shows the navigation menu with 'Session Manager' and 'System Status' highlighted. The main content area is titled 'SIP Entity, Entity Link Connection Status' and shows a table of entity links for 'silasm4'. The table has columns for Session Manager Name, SIP Entity Resolved IP, Port, Proto., Conn. Status, Reason Code, and Link Status. The 'Conn. Status' and 'Link Status' columns are highlighted with red boxes, showing 'Up' for both.

- **SIP INVITE to Receiving Communication Manager**

[illegible]

### 6.3 Verify Avaya Aura® Communication Manager Configuration

- To verify Call Flow, log in an agent at the receiving Communication Manager and place a call like a customer would through the solution. Select appropriate prompts. Verify call is delivered to the agent.
- To verify UUI data delivered with the call use the **uui-info** button programmed on the agent's phone.
- Use the CM SAT command **list trace tac x** where x is the TAC for the desired trunk group to be monitored. Verify the SIP routing to the CM SIP trunk connected to CM. **Note:** use the **status trunk** command on the CM SAT to see trunk member activity.
- Use the CM SAT command **list trace vec x** where x is the vector defined in **Section 3.9** and **Section 3.11** to trace for the call scenario. Verify applicable vector steps are processed.
- Use the CM SAT command **list trace vdn x** where x is the VDN defined in **Section 3.10** and **Section 3.12** to trace for the call scenario.
- Use the CM SAT command **display events** to display applicable failures logged by Communication Manager.

## 7. Conclusion

As illustrated here in these Application Notes, User-to-User data can be passed successfully for Network Call Redirection using Avaya Aura® Communication Manager and the Look-Ahead Interflow feature over SIP trunks that are integrated with Avaya Aura® Session Manager and AudioCodes Mediant™ 3000 Gateway. The following is a list of items observed from testing:

- Depending on the size of ASAIUUI data, other LAI information may be bumped such as Collected digits, Universal Call ID, VDN name and/or In-VDN time.
- If the VDN Name is bumped from LAI, the VDN Name of the Sending Communication Manager is not presented on the display of the answering agent phone.
