

**Application Notes for Configuring Avaya Aura®
Communication Manager 6.0.1 as an Evolution Server and
Avaya Aura® Session Manager 6.1 to support British
Telecom SIP Trunk Service 2.1.0.8 - Issue 1.0**

Abstract

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) trunking between the British Telecom SIP Trunk Service and an Avaya SIP enabled enterprise solution. The Avaya solution consists of Avaya Aura® Session Manager and Avaya Aura® Communication Manager Evolution Server. British Telecom is a member of the DevConnect Service Provider program.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) trunking between British Telecom (BT) SIP Trunk Service and an Avaya SIP enabled enterprise solution. The Avaya solution consists of Avaya Aura® Session Manager and Avaya Aura® Communication Manager Evolution Server. Customers using this Avaya SIP-enabled enterprise solution with the BT SIP Trunk Service are able to place and receive PSTN calls via a dedicated internet connection and the SIP protocol. This converged network solution is an alternative to traditional PSTN trunks. This approach generally results in lower cost for the enterprise.

2. General Test Approach and Test Results

The general test approach was to configure a simulated enterprise site using an Avaya SIP telephony solution consisting of Session Manager and Communication Manager. The enterprise site was configured to use the SIP Trunk Service provided by BT.

2.1. Interoperability Compliance Testing

The interoperability test included the following:

- Incoming calls to the enterprise site from the PSTN were routed to the DID numbers assigned by BT. Incoming PSTN calls terminated on SIP, H.323 and Digital telephones at the enterprise.
- Outgoing calls from the enterprise site were completed via BT to PSTN destinations.
- Outgoing calls from the enterprise to the PSTN were made from SIP, H.323 and Digital telephones.
- Calls to Emergency Services numbers such as 999 and 112 were made from the enterprise site via the SIP Trunk to BT.
- Calls were made using G.729, and G.711A codecs.
- Fax calls to/from a Group 3 fax machine to a PSTN connected fax machine using the T.38 mode.
- DTMF transmission using RFC 2833 with successful Voice Mail/Vector navigation for inbound and outbound calls.
- User features such as hold and resume, transfer, conference, call forwarding, etc.
- Caller ID Presentation and Caller ID Restriction.
- Direct IP-to-IP media (also known as “shuffling”) with SIP and H.323 telephones.
- Call coverage and call forwarding for endpoints at the enterprise site.
- Transmission and response of SIP OPTIONS messages sent by BT requiring Avaya response and sent by Avaya requiring BT response.

2.2. Test Results

Interoperability testing of the sample configuration was completed with successful results for the BT SIP Trunk Service with the following observations:

- No inbound toll free numbers were tested, however routing of inbound DID numbers and the relevant number translation was successfully tested.

- G.729 annex b (silence suppression) is not supported by BT SIP Trunk Service and thus was not tested.
- G.711mu is not supported by BT SIP Trunk Service and thus was not tested
- one-X Communicator was not tested using Telecommuter mode. All one-X Communicator test cases were completed using Road Warrior mode.
- For fax calls to be successful BT requested a Min-SE value of 1800 to be set on the Communication Manager (1800 is doubled to make 3600). For incoming calls BT is attempting to use a lower value causing a negotiation of the Min-SE to occur. This increases the number of SIP messages during an inbound call setup.

2.3. Support

For technical support on the Avaya products described in these Application Notes visit <http://support.avaya.com>.

For technical support on BT products please contact an authorized BT representative.

3. Reference Configuration

Figure 1 illustrates the test configuration. The test configuration shows an enterprise site connected to the BT SIP Trunk Service. Located at the enterprise site are a Session Manager and Communication Manager. Endpoints are Avaya 96xx series IP telephones (with SIP and H.323 firmware), Avaya 46xx series IP telephones (with H.323 firmware), Avaya Digital telephones and an analogue fax machine. Also included in the test configuration was an Avaya Desktop Video Device incorporating the Avaya Flare experience. For security purposes, any public IP addresses or PSTN routable phone numbers used in the compliance test are not shown in these Application Notes. Instead, public IP addresses have been replaced with private addresses and all phone numbers have been replaced with arbitrary.

Figure 1: BT Sample Configuration

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Equipment	Software
Avaya S8800 Server	Avaya Aura® Communication Manager 6.0.1 (R016x.00.1.510.1) Service Pack 18621 (System Platform 6.0.2.1.5)
Avaya G450 Media Gateway	FW 31.17.1
Avaya S8800 Server	Avaya Aura® Session Manager 6.1 (6.1.0.0.610023)
Avaya S8800 Server	Avaya Aura® System Manager 6.1 (System Platform 6.0.2.0.5, Template 6.1.4.0)
Avaya 9620 Phone (H.323)	3.1.1
Avaya 9620 Phone (SIP)	2.6.1
Avaya 9621 Phone (H.323)	s9621_41HAL_R6_0r58_V4r52
Avaya 4621 Phone (H.323)	2.9.1
Avaya Desktop Video Device, A175, incorporating the Avaya Flare experience	1.0.0
one-X® Communicator (SIP)	6.0.1.16-SP1-25226
one-X® Communicator (H.323)	6.0.1.16-SP1-25226
Digital Phone 2420	N/A
BT SIP Trunk Service	2.1.0.8

5. Configure Avaya Aura® Communication Manager

This section describes the steps for configuring Communication Manager for SIP Trunking. SIP trunks are established between Communication Manager and Session Manager. These SIP trunks will carry SIP Signaling associated with BT SIP Trunk Service. For incoming calls, the Session Manager receives SIP messages from BT and directs the incoming SIP messages to Communication Manager. Once the message arrives at Communication Manager, further incoming call treatment, such as incoming digit translations and class of service restrictions may be performed. All outgoing calls to the PSTN are processed within Communication Manager and may be first subject to outbound features such as automatic route selection, digit manipulation and class of service restrictions. Once Communication Manager selects a SIP trunk, the SIP signaling is routed to the Session Manager. The Session Manager directs the outbound SIP messages to the BT network. Communication Manager configuration was performed using the System Access Terminal (SAT). Some screens in this section have been abridged and highlighted for brevity and clarity in presentation. The general installation of the Avaya S8800 Server and Avaya G450 Media Gateway is presumed to have been previously completed and is not discussed here.

5.1. Confirm System Features

The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity. Use the **display system-parameters customer-options** command and on **Page 2**, verify that the **Maximum Administered SIP Trunks** supported by the system is sufficient for the combination of trunks to the BT network, and any other SIP trunks used.

display system-parameters customer-options			Page	2 of	11
OPTIONAL FEATURES					
IP PORT CAPACITIES			USED		
Maximum Administered H.323 Trunks:			12000	10	
Maximum Concurrently Registered IP Stations:			18000	4	
Maximum Administered Remote Office Trunks:			12000	0	
Maximum Concurrently Registered Remote Office Stations:			18000	0	
Maximum Concurrently Registered IP eCons:			113	0	
Max Concur Registered Unauthenticated H.323 Stations:			100	0	
Maximum Video Capable Stations:			18000	0	
Maximum Video Capable IP Softphones:			0	0	
Maximum Administered SIP Trunks:			24000	24	
Maximum Administered Ad-hoc Video Conferencing Ports:			24000	0	

On **Page 4**, verify that **IP Trunks** field is set to **y**.

```

5.2. Administer IP Node Names

The node names defined here will be used in other configuration screens to define a SIP signaling group between Communication Manager and Session Manager. Use the **change node-name ip** command and assign the node **Name** and **IP Address** for the Session Manager. In this case, **rom_sm6** and **192.168.1.18** are the **Name** and **IP Address** for the Session Manager. Also note the **procr** name as this is the processor interface that Communication Manager will use as the SIP signaling interface to Session Manager.

```
change node-names ip                                IP NODE NAMES

Name          IP Address
procr        192.168.1.4
rom_sm6      192.168.1.18
default       0.0.0.0
```

5.3. Administer IP Network Region

Use the **change ip-network-region x** command to set the following values:

- The **Authoritative Domain** field is configured to match the domain name configured on Session Manager (**Section 6.2**). In this configuration, the domain name is **rom2.bt.com**.
- By default, **IP-IP Direct Audio** (both **Intra-** and **Inter-Region**) is enabled to allow audio traffic to be sent directly between endpoints without using gateway VoIP resources. When a PSTN call is shuffled the enterprise endpoint will talk directly to the public interface of the BT Session Border Controller.
- The **Codec Set** is set to the number of the IP codec set to be used for calls within the IP network region. In this case, codec set **1** is used which is configured in **Section 5.4**.

```
change ip-network-region 1                                     Page 1 of 20
                                                             IP NETWORK REGION
Region: 1
Location: 1           Authoritative Domain: rom2.bt.com
Name:
MEDIA PARAMETERS                      Intra-region IP-IP Direct Audio: yes
      Codec Set: 1                  Inter-region IP-IP Direct Audio: yes
      UDP Port Min: 2048                      IP Audio Hairpinning? n
      UDP Port Max: 3329
DIFFSERV/TOS PARAMETERS
Call Control PHB Value: 46
      Audio PHB Value: 46
      Video PHB Value: 26
802.1P/Q PARAMETERS
Call Control 802.1p Priority: 6
      Audio 802.1p Priority: 6
      Video 802.1p Priority: 5      AUDIO RESOURCE RESERVATION PARAMETERS
H.323 IP ENDPOINTS                      RSVP Enabled? n
      H.323 Link Bounce Recovery? y
      Idle Traffic Interval (sec): 20
      Keep-Alive Interval (sec): 5
      Keep-Alive Count: 5
```

5.4. Administer IP Codec Set

Enter the **change ip-codec-set x** command to configure the codec set specified in the **IP Network Region** form and enter the list of audio codecs to be used in order of preference. For the interoperability test, the codecs supported by BT were configured, namely G.729 and G.711A. During compliance testing, other codec set configurations were also verified.

```
change ip-codec-set 1                                         Page 1 of 2
                                                             IP Codec Set

Codec Set: 1

Audio      Silence      Frames      Packet
Codec      Suppression   Per Pkt    Size (ms)
1: G.729   n                 2          20
2: G.711A  n                 2          20
3: G.723   n                 2          20
```

BT SIP Trunk Service supports the T.38 fax protocol. Configure the T.38 fax protocol by setting the **Fax Mode** to **t.38-standard** on **Page 2** of the codec set form as shown below.

change ip-codec-set 1		Page 2 of 2
IP Codec Set		
Allow Direct-IP Multimedia? n		
	Mode	Redundancy
FAX	t.38-standard	0
Modem	off	0
TDD/TTY	US	3
Clear-channel	n	0

5.5. Administer SIP Signaling Groups

This signaling group (and trunk group) will be used for inbound and outbound PSTN calls to BT SIP Trunk Service and will be configured using TLS (Transport Layer Security) and the default TLS port of 5061. Configure the **Signaling Group** using the **add signaling-group x** command as follows:

- Set the **Group Type** field to **sip**.
- The **Transport Method** field is set to **tls** (Transport Layer Security).
- The **Peer Detection Enabled** field should be set to **y** allowing the Communication Manager to automatically detect if the peer server is a Session Manager.
- Set the **Near-end Node Name** to the processor interface (node name **procr**) as shown in **Section 5.2**.
- Set the **Far-end Node Name** to the node name defined for the Session Manager (node name **rom_sm6**), as shown in **Section 5.2**.
- Ensure that the recommended TLS port value of **5061** is configured in the **Near-end Listen Port** and the **Far-end Listen Port** fields.
- In the **Far-end Network Region** field, enter the IP Network Region configured in **Section 5.3**. This field logically establishes the **far-end** for calls using this signaling group as network region 1.
- Set the **Far-end Domain** field to the domain of the enterprise.
- The **Direct IP-IP Audio Connections** field is set to **y**.
- The **DTMF over IP** field should remain set to the default value of **rtp-payload**. This value enables Communication Manager to send DTMF transmissions using RFC 2833.

Default values were used for other fields.

```
add signaling-group 4                                     Page 1 of 1
                                     SIGNALING GROUP

    DTMF over IP: rtp-payload    Bypass If IP Threshold Exceeded? n
                                RFC 3389 Comfort Noise? n
Session Establishment Timer(min): 5    Direct IP-IP Audio Connections? y
    Enable Layer 3 Test? y          IP Audio Hairpinning? n
    H.323 Station Outgoing Direct Media? y    Initial IP-IP Direct Media? n
                                                Alternate Route Timer(sec): 6
```

5.6. Administer SIP Trunk Group

A trunk group is associated with the signaling group described in **Section 5.5**. Configure the trunk group using the **add trunk-group x** command, where **x** is an available trunk group. On **Page 1** of this form:

- Set the **Group Type** field to **sip**.
- Choose a descriptive **Group Name**.
- Specify a trunk access code (**TAC**) consistent with the dial plan.
- The **Direction** is set to **two-way** to allow incoming and outgoing calls.
- Set the **Service Type** field to **tie**.
- Specify the signaling group associated with this trunk group in the **Signaling Group** field as previously configured in **Section 5.5**.
- Specify the **Number of Members** supported by this SIP trunk group.

add trunk-group 4		Page 1 of 21	
TRUNK GROUP			
Group Number: 4	Group Type: sip	CDR Reports: y	
Group Name: sip trunk to Rom SM6	COR: 1	TN: 1	TAC: 104

Dial Access? n	Night Service:		
Queue Length: 0			
Service Type: tie	Auth Code? n		
		Member Assignment Method: auto	
		Signaling Group: 4	
		Number of Members: 4	

On **Page 2** of the trunk-group form the **Preferred Minimum Session Refresh Interval (sec)** field should be set to a value mutually agreed with BT to prevent unnecessary SIP messages during call setup. Also note that the value for **Redirect On OPTIM Failure** was set to **8000** to allow additional set-up time for calls destined for an EC500 destination.

add trunk-group 4		Page 2 of 21	
Group Type: sip			
TRUNK PARAMETERS			
Unicode Name: auto			
		Redirect On OPTIM Failure: 8000	
SCCAN? n	Digital Loss Group: 18

Telephone Event Payload Type: 101		
Convert 180 to 183 for Early Media? n		
Always Use re-INVITE for Display Updates? y		
Identity for Calling Party Display: P-Asserted-Identity		
Enable Q-SIP? n		

5.7. Administer Calling Party Number Information

Use the **change public-unknown-numbering** command to configure Communication Manager to send the calling party number. In the sample configuration, all stations with a **4-digit** extension beginning with **39** will send the calling party number **4420711111x** to BT SIP Trunk Service, where **x** is the last digit of the 4-digit extension. This calling party number will be sent in the SIP From, Contact and PAI headers, and displayed on display-equipped PSTN telephones.

change public-unknown-numbering 0					Page 1 of 2
NUMBERING - PUBLIC/UNKNOWN FORMAT					
Ext	Ext	Trk	CPN	Total	
Len	Code	Grp(s)	Prefix	CPN	
				Len	
4	39	4	4420711111	12	Total Administered: 1
					Maximum Entries: 240

In these Application Notes, the Automatic Route Selection (ARS) feature will be used to route outbound calls via the SIP trunk to BT SIP Trunk Service. In the sample configuration, the single digit 9 is used as the ARS access code. Avaya telephone users will dial 9 to reach an outside line. Use the **change feature-access-codes** command to configure or observe 9 as the **Auto Route Selection (ARS) - Access Code 1**.

```
change feature-access-codes                                     Page    1 of   10
                        FEATURE ACCESS CODE (FAC)
Abbreviated Dialing List1 Access Code:
Abbreviated Dialing List2 Access Code:
Abbreviated Dialing List3 Access Code:
Abbreviated Dial - Prgm Group List Access Code:
                        Announcement Access Code:
                        Answer Back Access Code:
Auto Alternate Routing (AAR) Access Code: 7
Auto Route Selection (ARS) - Access Code 1: 9           Access Code 2:
```

Use the **change ars analysis** command to configure the routing of dialed digits following the first digit 9. A small sample of dial patterns is illustrated here. Further administration of ARS is beyond the scope of these Application Notes. The example entries shown will match outgoing calls to numbers beginning **0207** or **0208**. Calls are sent to **Route Pattern 5**.

change ars analysis 02							Page 1 of 2

																																				Subaddress													
1:	y	y	y	y	y	n	n													rest														none															
2:	v	v	v	v	v	n	n													rest														none															

5.9. Administer Incoming Digit Translation

This step configures the settings necessary to map incoming DID calls to the proper Communication Manager extension(s). The incoming digits sent in the INVITE message from BT can be manipulated as necessary to route calls to the desired extension. In the examples used in the compliance testing, the incoming DID numbers provided by BT correlate to the internal extensions assigned within Communication Manager. The entries displayed below translates incoming DID numbers 0207111111 and 0208111111 to a 4 digit extension by deleting all of the incoming digits and inserting an extension.

change inc-call-handling-trmt trunk-group 1					Page	1 of	3
INCOMING CALL HANDLING TREATMENT							
Service/ Feature	Number Len	Number Digits	Del	Insert			
public-ntwrk	11	0207111111	a11	3936			
public-ntwrk	11	0208111111	a11	3934			

5.10. EC500 Configuration

When EC500 is enabled on the Communication Manager station, a call to that station will generate a new outbound call from Communication Manager to the configured EC500 destination, typically a mobile phone. The following screen shows an example EC500 configuration for the user with station extension 3910. Use the command **change off-pbx-telephone station mapping x**, where x is the Communication Manager station.

- The **Station Extension** field will automatically populate.
- For **Application** enter **EC500**.
- Enter a **Dial Prefix** (e.g., 9) if required by the routing configuration.
- For the **Phone Number** field enter the phone that will also be called (e.g., **0788011111**).
- Set the **Trunk Selection** to **ars** so that the ARS tables will be used to determine how Communication Manager will route to the Phone Number destination.
- Set the **Config Set** to **1**.
- Other parameters can retain default value.

change off-pbx-telephone station-mapping 3910								Page	1 of	3
STATIONS WITH OFF-PBX TELEPHONE INTEGRATION										
Station Extension	Application	Dial Prefix	CC	Phone Number	Trunk Selection	Config Set	Dual Mode			
3910	EC500	-		0788011111	ars	1				
		-								

Save Communication Manager changes by entering **save translation** to make them permanent.

6. Configuring Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. The Session Manager is configured via the System Manager. The procedures include the following areas:

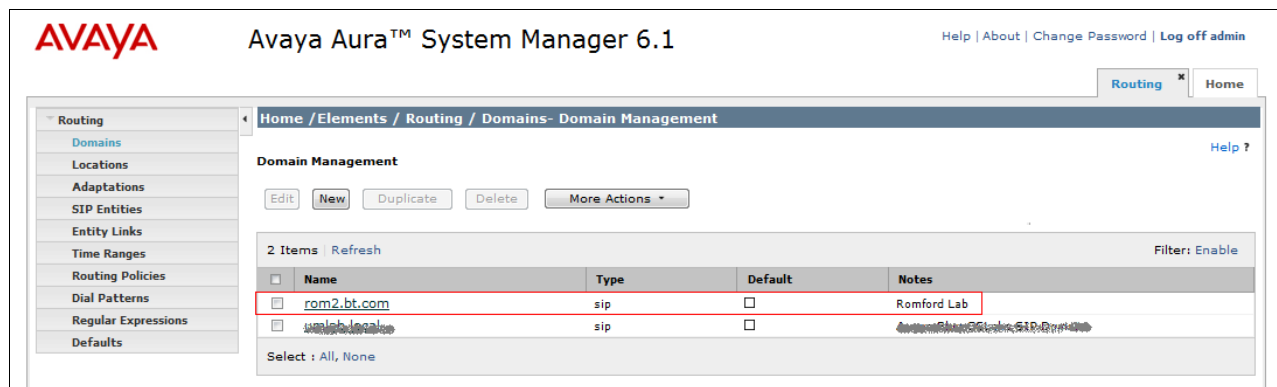

- Log in to Avaya Aura® System Manager
- Administer SIP domain
- Administer Adaptations
- Administer SIP Entities
- Administer Entity Links
- Administer Routing Policies
- Administer Dial Patterns
- Administer Avaya Aura® Communication Manager as Managed Element
- Administer Application for Avaya Aura® Communication Manager
- Administer Application Sequence for Avaya Aura® Communication Manager
- Administer SIP Extensions

6.1. Log in to Avaya Aura® System Manager

Access the System Manager using a Web Browser by entering **http://<FQDN>/SMGR**, where <FQDN> is the fully qualified domain name of System Manager. Log in using appropriate credentials (not shown) and the Home tab will be presented with menu options shown below.

6.2. Administer SIP domain

To add the SIP domain that will be used with Session Manager, select **Routing** from the **Home** tab menu (not shown) and in the resulting tab select **SIP Domains** from left hand menu. Click the **New** button to create a new SIP domain entry. In the **Name** field enter the domain name (e.g., **rom2.bt.com**) and optionally a description for the domain in the **Notes** field. Click **Commit** (not shown) to save changes.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help", "About", "Change Password", and "Log off admin". The main content area is titled "Domain Management" and includes a "Help ?" link. Below the title are buttons for "Edit", "New", "Duplicate", "Delete", and "More Actions". A table displays two items, with the first item, "rom2.bt.com", highlighted by a red box. The table has columns for "Name", "Type", "Default", and "Notes". The "Notes" field for "rom2.bt.com" contains "Romford Lab".

Name	Type	Default	Notes
rom2.bt.com	sip	<input type="checkbox"/>	Romford Lab
romlab.local	sip	<input type="checkbox"/>	

6.3. Administer Locations

Locations can be used to identify logical and/or physical locations where SIP Entities reside, for the purposes of bandwidth management. One location is added to the sample configuration for the enterprise SIP entities. On the **Routing** tab, select **Locations** from the left hand menu. Under **General**, in the **Name** field enter an informative name for the location. Scroll to the bottom of the page and under **Location Pattern**, click **Add**, then enter an **IP Address Pattern** in the resulting new row; '*' is used to specify any number of allowed characters at the end of the string. Below is the location configuration used for the simulated enterprise.

The screenshot displays the Avaya Aura™ System Manager 6.1 web interface. The left-hand navigation menu includes options like Routing, Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The 'Locations' section is active, showing 'Location Details' for a specific location. The 'General' tab is selected, displaying the 'Name' field with the value 'Romford Avaya Lab' and a 'Notes' field. Below this, the 'Overall Managed Bandwidth' section shows 'Managed Bandwidth Units' set to 'Mbit/sec' and 'Total Bandwidth' set to '1000'. The 'Per-Call Bandwidth Parameters' section shows 'Default Audio Bandwidth' set to '80 Kbit/sec'. The 'Location Pattern' section at the bottom features an 'Add' button and a table with one row. The table has columns for 'IP Address Pattern' and 'Notes'. The 'IP Address Pattern' column contains the value '*192.168.1.*' and the 'Notes' column contains 'Romford Avaya Lab'. A 'Filter: Enable' button is located to the right of the table. The 'Select' dropdown at the bottom is set to 'All, None'.

IP Address Pattern	Notes
192.168.1.	Romford Avaya Lab

6.4. Administer Adaptations

In order to ensure that the E.164 numbering format is used between the enterprise and BT SIP Trunk Service, an adaptation module is used to perform some digit manipulation. This adaptation is applied to the Communication Manager SIP entity. To add an adaptation, on the **Routing** tab select **Adaptations** on the left hand menu and then click on the **New** button (not shown). Under **General**:

- In the **Adaptation Name** field enter an informative name.
- In the **Module Name** field select <click to add module> from the drop down list and enter **DigitConversionAdapter** in the resulting **New Module Name** field (not shown).

Avaya Aura™ System Manager 6.1

Help | About | Change Password | Log off admin

Routing * Home

Home / Elements / Routing / Adaptations- Adaptation Details

Adaptation Details

General

* Adaptation name: Romford CM i/c and o/g PSTN

Module name: DigitConversionAdapter

Module parameter:

Egress URI Parameters:

Notes: For calls into and out of the Romf

Under **Digit Conversion for Incoming Calls to SM**, click the **Add** button and specify the digit manipulation to be performed as follows:

- Enter the leading digits that will be matched in the **Matching Pattern** field.
- In the **Min** and **Max** fields set the minimum and maximum digits allowed in the digit string to be matched.
- In the **Delete Digits** field enter the number of leading digits to be removed.
- In the **Insert Digits** field specify the digits to be prefixed to the digit string.
- In the **Address to modify** field specify the digits to manipulate by the adaptation. In this configuration the dialed number is the target so **destination** has been selected.

This will ensure any destination numbers received from Communication Manager are converted to the E.164 numbering format before being processed by Session Manager

Digit Conversion for Incoming Calls to SM

Add Remove

5 Items Refresh Filter: Enable

	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Notes
<input type="checkbox"/>	* 0207	* 4	* 36		* 1	+44	destination	converts 0207 to +44207 for N
<input type="checkbox"/>	* 0208	* 4	* 36		* 1	+44	destination	converts 0208 to +44208 for N
<input type="checkbox"/>	* 07	* 2	* 13		* 1	+44	destination	converts 07 numbers to +447 fo

Select : All, None

Under **Digit Conversion for Outgoing Calls from SM** click the **Add** button and specify the digit manipulation to be performed as follows:

- Enter the leading digits that will be matched in the **Matching Pattern** field.
- In the **Min** and **Max** fields set the minimum and maximum digits allowed in the digit string to be matched.
- In the **Delete Digits** field enter the number of leading digits to be removed.
- In the **Insert Digits** field specify the digits to be prefixed to the digit string.
- In the **Address to modify** field specify the digits to manipulate by the adaptation. In this configuration the dialed number is the target so **destination** has been selected.

This will ensure any destination numbers will have the + symbol and international dialing code removed before being presented to Communication Manager.

Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Notes
*+44207	*6	*36		*3	0	destination	converts +44207 to 0207 for C
*+44208	*6	*36		*3	0	destination	converts +44208 to 0208 for C

6.5. Administer SIP Entities

A SIP Entity must be added for each SIP-based telephony system supported by a SIP connection to the Session Manager. To add a SIP Entity, select **SIP Entities** on the left panel menu and then click on the **New** button (not shown). The following will need to be entered for each SIP Entity.

Under **General**:

- In the **Name** field enter an informative name.
- In the **FQDN or IP Address** field enter the IP address of Session Manager or the signaling interface on the connecting system.
- In the **Type** field use **Session Manager** for a Session Manager SIP entity, **CM** for a Communication Manager SIP entity and **Other** for the BT SIP Trunk Service SIP entities.
- In the **Location** field select the appropriate location from the drop down menu.
- In the **Time Zone** field enter the time zone for the SIP Entity.

In this configuration there are three types of SIP Entity.

- Session Manager SIP Entity
- Communication Manager SIP Entity
- BT SIP Trunk Service SIP Entities

6.5.1. Avaya Aura® Session Manager SIP Entity

The following screens show the SIP entity for Session Manager. The **FQDN or IP Address** field is set to the IP address of the Session Manager SIP signaling interface.

6.5.3. BT SIP Trunk Service SIP Entities

BT has multiple SBCs in their network as illustrated in **Figure 1**. Each SBC must be added to Session Manager as a SIP entity. As an example the following screen shows the SIP Entity for BT SBC1. The **FQDN or IP Address** field is set to the IP address of the SBC1 (see **Figure 1**).

The screenshot shows the 'SIP Entity Details' configuration page in Avaya Aura System Manager 6.1. The page is titled 'Home / Elements / Routing / SIP Entities- SIP Entity Details'. The left sidebar shows a navigation menu with 'SIP Entities' selected. The main content area is divided into 'General' and 'SIP Link Monitoring' sections. The 'General' section contains the following fields:

- Name:** NOAS SBC Birm2
- FQDN or IP Address:** 192.168.5.62
- Type:** Other
- Notes:** Primary SIP inbound / outbound
- Adaptation:** (dropdown menu)
- Location:** NOAS SIP Service
- Time Zone:** Europe/London
- Override Port & Transport with DNS SRV:** ☐
- SIP Timer B/F (in seconds):** 4
- Credential name:** (text field)
- Call Detail Recording:** none
- SIP Link Monitoring:** Use Session Manager Configuration

The 'SIP Link Monitoring' section is currently empty.

The following screen shows all 4 BT SBC SIP Entities after they have been configured.

The screenshot shows the 'SIP Entities' list in Avaya Aura System Manager 6.1. The page is titled 'Home / Elements / Routing / SIP Entities - SIP Entities'. The left sidebar shows a navigation menu with 'SIP Entities' selected. The main content area shows a list of 34 items. The table below lists the first six items, which are highlighted with a red border.

Name	FQDN or IP Address	Type	Notes
NOAS SBC Birm1	192.168.5.58	Other	Second choice inbound/outbound calls
NOAS SBC Birm2	192.168.5.62	Other	Primary SIP inbound / outbound calls
NOAS SBC Man1	192.168.5.50	Other	fourth choice inbound / outbound calls
NOAS SBC Man2	192.168.5.54	Other	third choice inbound / outbound calls
Romford CM6.1	192.168.1.4	CM	PE address
Romford SM 6.1	192.168.1.18	Session Manager	

The table also includes a 'Filter: Enable' button and a 'Select : All, None' dropdown. The page number is 2 of 3.

6.6. Administer Entity Links

A SIP trunk between a Session Manager and another system is described by an Entity Link. To add an Entity Link, select **Entity Links** on the left panel menu and click on the **New** button. In the resulting screen, fill in the following fields displayed in the new row.

- In the **Name** field enter an informative name.
- In the **SIP Entity 1** field select **Romford SM 6.1**.
- In the **Port** field enter the port number to which the other system sends its SIP requests.
- In the **SIP Entity 2** field enter the other SIP Entity for this link, created in **Section 6.5**.
- In the **Port** field enter the port number to which the other system expects to receive SIP requests.
- Select the **Trusted** tick box to make the other system trusted.
- In the **Protocol** field enter the transport protocol to be used to send SIP requests.

Click **Commit** to save changes. The following screen shows the Entity Links used in this configuration.

6.7. Administer Routing Policies

Routing policies must be created to direct how calls will be routed to a system. To add a routing policy, select **Routing Policies** on the left panel menu and then click on the **New** button (not shown).

Under **General**:

- Enter an informative name in the **Name** field.
- Under **SIP Entity as Destination**, click **Select**, and in the resulting window (not shown) select the appropriate SIP entity to which this routing policy applies.
- Under **Time of Day**, click **Add**, and then select the time range.

The following screen shows the routing policy for Communication Manager

The screenshot displays the Avaya Aura System Manager 6.1 interface. The left sidebar shows the navigation menu with 'Routing Policies' selected. The main content area is titled 'Routing Policy Details' and includes a breadcrumb trail: 'Home / Elements / Routing / Routing Policies - Routing Policy Details'. The 'General' tab is active, showing the 'Name' field with the value 'NOAS calls to Rom CM 6.1'. Below this, there are checkboxes for 'Disabled' and a 'Notes' field. The 'SIP Entity as Destination' section has a 'Select' button. Below this is a table with columns: Name, FQDN or IP Address, Type, and Notes. The table contains one entry: 'Romford CM6.1' with FQDN '192.168.1.4', Type 'CM', and Notes 'PE address'. The 'Time of Day' section has 'Add', 'Remove', and 'View Gaps/Overlaps' buttons. Below this is a table with columns: Ranking, Name, Mon, Tue, Wed, Thu, Fri, Sat, Sun, Start Time, End Time, and Notes. The table contains one entry: '24/7' with 'Mon' through 'Sun' all checked, 'Start Time' '00:00', 'End Time' '23:59', and 'Notes' 'Time Range 24/7'. The interface also includes a 'Commit' button and a 'Cancel' button in the top right corner.

As an example, the following screen shows the routing policy for BT SBC1, a routing policy must be added for each SBC. Note the **Ranking** given to the time range in this routing policy is set to **10**. Each SBC routing policy will have a different ranking; this is to define a priority order for the routing policies when they are added to a dial pattern in **Section 6.8**. The rankings are set in blocks of ten for clarity in this Application Note.

6.8. Administer Dial Patterns

A dial pattern must be defined to direct calls to the appropriate telephony system. To configure a dial pattern select **Dial Patterns** on the left panel menu and then click on the **New** button (not shown).

Under **General**:

- In the **Pattern** field enter a dialed number or prefix to be matched.
- In the **Min** field enter the minimum length of the dialed number.
- In the **Max** field enter the maximum length of the dialed number.
- In the **SIP Domain** field select the domain configured in **Section 6.2**.

Under **Originating Locations and Routing Policies**, click **Add** in the resulting screen (not shown). Under **Originating Location** select **ALL** and under **Routing Policies** select one of the routing policies defined in **Section 6.7**. Click **Select** button to save. The following screen shows an example dial pattern configured for BT SIP Trunk Service. Note the ranking for each routing policy as applied in **Section 6.7**. The routing policy with the lowest rank will be selected first, if this route is unavailable or does not respond then the routing policy with the next lowest rank will be selected and so on. This allows for redundant routing within Session Manager.

On the **Attributes** tab, under the **Attributes** heading, enter values in the following fields and use defaults for the remaining fields:

- In the **Login** field enter a login name for Communication Manager (SAT SSH login).
- In the **Password** field enter the password for Communication Manager (SAT SSH password).
- Select the **Is SSH Connection** check box if SSH is to be used.
- In the **Port** field enter the port number to use for SAT access.

Select **Commit** (not shown), to synchronize System Manager with the Communication Manager in the background.

The screenshot shows the Avaya Aura System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help | About | Change Password | Log off admin". The main navigation menu on the left lists "Inventory", "Manage Elements", "Discovered Inventory", "Discovery Management", and "Synchronization". The breadcrumb trail is "Home / Elements / Inventory / Manage Elements - View CM". The page title is "View CM: Romford CM 6-0". The "Attributes" tab is selected, and a red box highlights the following fields: "Login" (value: romsysmng), "Password" (masked with dots), "Is SSH Connection" (checked), and "Port" (value: 5022). The "Alternate IP Address" field is also visible below the highlighted fields.

6.10. Administer Application for Communication Manager

From the Home tab select Session Manager from the menu. In the resulting tab from the left panel menu select **Application Configuration** → **Applications** and click **New** (not shown) and configure as follows:

- In the **Name** field enter a name for the application.
- In the **SIP Entity** field select the SIP entity for the Communication Manager configured in **Section 6.5.2**.
- In the **CM System for SIP Entity** field select the managed element for the Communication Manager configured in **Section 6.9**.

Select **Commit** to save the configuration.

The screenshot shows the Avaya Aura System Manager 6.1 web interface. The top header includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help | About | Change Password | Log off admin". Below the header is a breadcrumb trail: "Home / Elements / Session Manager / Application Configuration / Applications - Applications". The left sidebar contains a navigation menu with categories like "Session Manager", "Network Configuration", "Device and Location Configuration", and "Application Configuration". The "Application Configuration" section is expanded, showing "Applications" as the selected option. The main content area is titled "Application Editor" and contains a form for creating a new application. The form fields are: "Name" (text input with value "non-IMS SIP users"), "SIP Entity" (dropdown menu with value "Romford CM6.1"), "CM System for SIP Entity" (dropdown menu with value "Romford CM 6-0" and a "Refresh" button), and "Description" (text input with value "Romford CM 6-0"). There are also "View/Add CM Systems" links next to the "CM System" dropdown. At the top right of the form area are "Commit" and "Cancel" buttons. A red box highlights the "Name", "SIP Entity", and "CM System for SIP Entity" fields.

6.11. Administer Application Sequence for Communication Manager

From the left panel navigate to **Session Manager** → **Application Configuration** → **Application Sequences** and click on **New** (not shown).

- In the **Name** field enter a descriptive name.
- Under **Available Applications**, click the + sign in front of the appropriate application instance. When the screen refreshes the application should be displayed under the **Applications in this Sequence** heading.

Select **Commit**.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar contains a navigation menu with options like Session Manager, Dashboard, Session Manager, Administration, Communication Profile Editor, Network Configuration, Device and Location Configuration, Application Configuration, Applications, Application Sequences, Implicit Users, NRS Proxy Users, System Status, and System Tools. The main content area is titled 'Application Sequence Editor' and includes a breadcrumb trail: Home / Elements / Session Manager / Application Configuration / Application Sequences - Application Sequences. The 'Application Sequence' section has a 'Name' field containing 'non-IMS SIP users application sq' and an empty 'Description' field. Below this is the 'Applications in this Sequence' section, which includes buttons for 'Move First', 'Move Last', and 'Remove'. A table lists the current sequence items, with one item highlighted: 'non-IMS SIP users' (Sequence Order 1, SIP Entity Romford CM6.1, Mandatory checked, Description Romford CM 6-0). At the bottom is the 'Available Applications' section, which shows a table with one item: 'non-IMS SIP users' (SIP Entity Romford CM6.1, Description Romford CM 6-0).

6.12. Administer SIP Extensions

SIP extensions are registered with the Session Manager and use Communication Manager for their feature and configuration settings. From the Home tab select **User Management** from the menu. Then select **Manage Users** and click **New** (not shown).

On the **Identity** tab:

- Enter the user's name in the **Last Name** and **First Name** fields.
- In the **Login Name** field enter a unique system login name in the form of user@domain (e.g. **3936@rom2.bt.com**) which is used to create the user's primary handle.
- The **Authentication Type** should be **Basic**.
- In the **Password/Confirm Password** fields enter an alphanumeric password.

Click the show/hide button next to **Session Manager Profile**:

- Make sure the **Session Manager** check box is checked.
- Select the appropriate Session Manager instance from the drop-down menu in the **Primary Session Manager** field.
- Select the appropriate application sequence from the drop-down menu in the **Origination Application Sequence** field configured in **Section 6.11**.
- Select the appropriate application sequence from the drop-down menu in the **Termination Application Sequence** field configured in **Section 6.11**.
- Select the appropriate location from the drop-down menu in the **Home Location** field as configured in **Section 6.3**.

Click the show/hide button next to **Endpoint Profile**.

- Select the Communication Manager SIP Entity from the **System** drop-down menu.
- Select **Endpoint** from the drop-down menu for **Profile Type**.
- Enter the extension in the **Extension** field.
- Select the desired template from the **Template** drop-down menu.
- For the **Port** field select **IP**.
- Select the **Delete Endpoint on Unassign of Endpoint from User or on Delete User** check box.
- Select **Commit** to save changes and the System Manager will add the Communication Manager user configuration automatically.

The screenshot shows a web-based configuration form for an "Endpoint Profile". At the top, there is a section header "Endpoint Profile" with a dropdown arrow. Below this, several fields are visible, some of which are highlighted with red boxes. The fields include: "System" (a dropdown menu showing "Romford CM 6-0"), "Profile Type" (a dropdown menu showing "Endpoint"), "Extension" (a text input field containing "3936" with a search icon), "Template" (a dropdown menu showing "DEFAULT_9620SIP_CM_6_0"), "Set Type" (a text input field containing "9620SIP"), "Security Code" (a text input field containing "*****"), "Port" (a dropdown menu showing "IP"), and "Voice Mail Number" (a text input field). There is also a checkbox labeled "Delete Endpoint on Unassign of Endpoint from User or on Delete User." which is checked. At the bottom of the form, there is a section header "Messaging Profile" with a dropdown arrow. In the bottom right corner, there are "Commit" and "Cancel" buttons. In the bottom left corner, there is a legend indicating that an asterisk (*) denotes a required field.

7. Service Provider Configuration

The configuration of the BT equipment used to support the BT SIP trunk service is outside of the scope for these application notes and will not be covered. To obtain further information on BT equipment and system configuration please contact an authorised BT representative.

8. Verification Steps

This section provides steps that may be performed to verify that the solution is configured correctly.

1. From System Manager Home Tab click on Session Manager and navigate to **Session Manager → System Status → SIP Entity Monitoring**. Select the relevant SIP Entity from the list and observe if the **Conn Status** and **Link Status** are showing as **up**.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The breadcrumb trail is: Home / Elements / Session Manager / System Status / SIP Entity Monitoring - SIP Entity Monitoring. The page title is "SIP Entity, Entity Link Connection Status". Below the title, it says "This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity." The main content area shows "All Entity Links to SIP Entity: Romford CM6.1" and a "Summary View" button. A table displays the connection status for one item, "Romford SM 6.1". The table has columns: Details, Session Manager Name, SIP Entity Resolved IP, Port, Proto., Conn. Status, Reason Code, and Link Status. The "Conn. Status" and "Link Status" columns are highlighted with a red border, showing "Up" for both.

Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
Show	Romford SM 6.1	192.168.1.4	5061	TLS	Up	200 OK	Up

2. From the Communication Manager SAT interface run the command **status trunk x** where **x** is a previously configured SIP trunk. Observe if all channels on the trunk group display **in-service/idle**.

```
status trunk 4
```

TRUNK GROUP STATUS			
Member	Port	Service State	Mtce Connected Ports Busy
0004/001	T00001	in-service/idle	no
0004/002	T00007	in-service/idle	no
0004/003	T00008	in-service/idle	no
0004/004	T00009	in-service/idle	no
0004/005	T00010	in-service/idle	no

3. Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active.
4. Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active.
5. Verify that the user on the PSTN can end an active call by hanging up.
6. Verify that an endpoint at the enterprise site can end an active call by hanging up.

9. Conclusion

These Application Notes describe the configuration necessary to connect Avaya Aura® Communication Manager Evolution Server and Avaya Aura® Session Manager to BT SIP Trunk Service. BT SIP Trunk Service is a SIP-based Voice over IP solution providing businesses a flexible, cost-saving alternative to traditional hardwired telephony trunks.
