

Application Notes for Configuring the Cincinnati Bell Business SIP Trunking Service with Avaya Aura® Communication Manager 7.0, Avaya Aura® Session Manager 7.0 and Avaya Session Border Controller for Enterprise 7.0 – Issue 1.0

Abstract

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) Trunking between the Cincinnati Bell Business SIP Trunking Service and an Avaya SIP-enabled enterprise solution. The Avaya solution consists of Avaya Aura® Session Manager 7.0, Avaya Aura® Communication Manager 7.0, Avaya Session Border Controller for Enterprise 7.0 and various Avaya endpoints. Cincinnati Bell Technology Solutions (CBTS) is a member of the Avaya DevConnect Service Provider program.

Readers should pay attention to **Section 2**, in particular the scope of testing as outlined in **Section 2.1** as well as the observations noted in **Section 2.2**, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) Trunking between the Cincinnati Bell Business SIP Trunking Service and an Avaya SIP-enabled enterprise solution. The Avaya solution consists of Avaya Aura® Session Manager 7.0, Avaya Aura® Communication Manager 7.0, Avaya Session Border Controller for Enterprise 7.0 and various Avaya endpoints. In addition, Avaya Aura® System Manager 7.0 is used to configure Avaya Aura® Session Manager.

Customers using this Avaya SIP-enabled enterprise solution with the Cincinnati Bell Business SIP Trunking Service are able to place and receive PSTN calls via a broadband WAN connection with SIP. This converged network solution is an alternative to traditional PSTN trunks such as ISDN-PRI.

2. General Test Approach and Test Results

The general test approach was to connect a simulated enterprise site to the Cincinnati Bell Business SIP Trunking Service provided by Cincinnati Bell Technology Solutions (CBTS) via a broadband connection and exercise the features and functionality listed in **Section 2.1**. The simulated enterprise site was comprised of Communication Manager, Session Manager and Avaya Session Border Controller for Enterprise (Avaya SBCE).

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute for full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

2.1. Interoperability Compliance Testing

To verify SIP trunking interoperability, the following features and functionality were covered during the interoperability compliance test.

- Sending and receiving SIP OPTIONS queries to the service provider
- Inbound and outbound PSTN calls (via the SIP trunk) to/from analog, digital, H.323 and SIP telephones at the enterprise
- Inbound and outbound PSTN calls to/from Avaya one-X® Communicator (soft client) using multiple protocols (H.323 and SIP) and multiple modes (Local Computer and Other Phone mode)
- Inbound and outbound PSTN calls to/from Avaya Communicator for Windows
- Various call types including: local, long distance, international, outbound toll-free, and local directory assistance
- Codecs G.711A and G.729A
- DTMF transmission using RFC 2833
- Caller ID presentation and Caller ID restriction
- Response to incomplete call attempts and trunk errors

- Voicemail navigation for inbound and outbound calls
- Voicemail Message Waiting Indicator (MWI)
- User features such as hold and resume, internal call forwarding, transfer, and conference
- Off-net call forwarding and mobility (Extension to cellular – EC500)
- T.38 Fax and fallback to G.711 Fax
- Network Call Redirection using REFER
- Remote Worker

Emergency calls and inbound toll-free calls were not tested as part of the compliance test.

The following items are not supported by the Cincinnati Bell Business SIP Trunking Service:

- Network call redirection triggered by a 302 Moved Temporarily response.
- Notification of intermediate call states (via NOTIFY messages) for a call that is redirected with a REFER message.
- Passing of User-to User Information (UI header) when a call is redirected with REFER.

2.2. Test Results

Interoperability testing of the Cincinnati Bell Business SIP Trunking Service was completed with successful results for all test cases with the exception of the observations and/or limitations described below.

- **Supported Header** - On outbound calls, CBTS sends an empty **Supported** header in the 183 and 200 OK responses. This triggers the Avaya SBCE to send an improperly formatted **Supported** header to the inside of the enterprise. Communication Manager discards the message as invalid and the call fails. A similar failure occurs when CBTS sends a reINVITE with an empty **Supported** header. The impact of this was the dropping of an active call. As a workaround, a signaling rule was added to the Avaya SBCE (**Section 7.9.2**) to remove the incoming **Supported** header. The Avaya SBCE would then generate its own **Supported** header for messages it sends on the internal interface.
- **T.38 Fax** - On outbound fax calls, Communication Manager has a 4 second timer from the time it detects fax tone to receive the reINVITE from CBTS to switch to T.38 fax. Otherwise, it will fallback to G.711 fax. The T.38 reINVITE from CBTS arrives after this 4 second timer has expired. The result is that all outbound faxes will use G.711 fax if Communication Manager is configured for T.38 with G.711 fallback. As a workaround, the Communication Manager can be configured with T.38 only to force the use of T.38. In addition, since CBTS attempts to reINVITE to G.711 before switching to T.38, then G.711 must be in the Communication Manager codec list in order to support T.38 or the call will fail. See **Section 5.4**.
- **Operator-assisted calls** - Operator-assisted calls (0 + 10 digits) are routed the same as direct dialed calls (1 + 10 digits).

2.3. Support

For technical support on the Cincinnati Bell Business SIP Trunking Service, use the Customer Support link at www.cincinnati-bell.com/business.

Avaya customers may obtain documentation and support for Avaya products by visiting <http://support.avaya.com>. Alternatively, in the United States, (866) GO-AVAYA (866-462-8292) provides access to overall sales and service support menus.

3. Reference Configuration

Figure 1 illustrates a sample Avaya SIP-enabled enterprise solution connected to the Cincinnati Bell Business SIP Trunking Service.

The components used to create the simulated customer site included:

- System Manager
- Session Manager
- Communication Manager
- Avaya G450 Media Gateway
- Avaya Media Server
- Avaya Session Border Controller for Enterprise
- Avaya Aura® Messaging
- Avaya 1600 Series IP Deskphones (H.323)
- Avaya 9600 Series IP Deskphones (H.323 and SIP)
- Avaya one-X® Communicator (H.323 and SIP)
- Avaya Communicator for Windows

Located at the edge of the enterprise is the Avaya SBCE. It has a public side that connects to the external network and a private side that connects to the enterprise network. All SIP and RTP traffic entering or leaving the enterprise flows through the Avaya SBCE. In this way, the Avaya SBCE can protect the enterprise against any SIP-based attacks. The Avaya SBCE provides network address translation at both the IP and SIP layers. For security reasons, any actual public IP addresses used in the configuration have been replaced with private IP addresses in this document. Similarly, any references to real routable PSTN numbers have been replaced with numbers that cannot be routed over the PSTN.

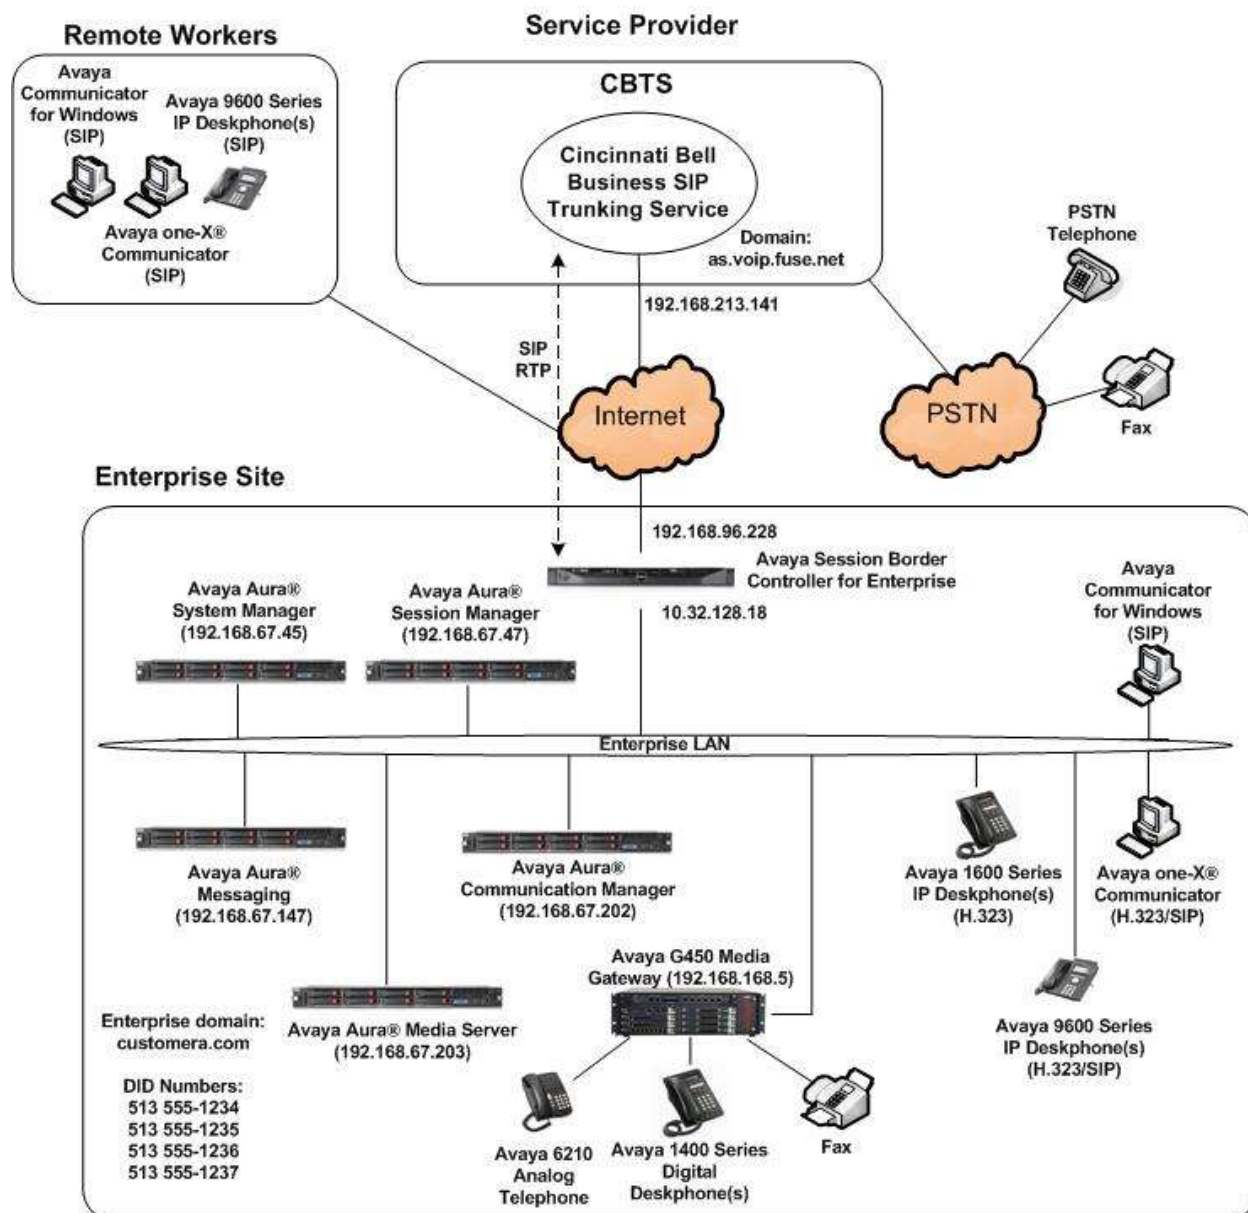

Figure 1: Test Configuration

A separate trunk was created between Communication Manager and Session Manager to carry the service provider traffic. This was done so that any trunk or codec setting required by the service provider could be applied only to this trunk and does not affect other enterprise SIP traffic. In addition, this trunk carried both inbound and outbound traffic.

For inbound calls, the calls flow from the service provider to the Avaya SBCE and then to Session Manager. Session Manager uses the configured dial patterns (or regular expressions) and routing policies to determine the recipient (in this case Communication Manager) and on which link to send the call. Once the call arrives at Communication Manager, further incoming call treatment, such as incoming digit translations and class of service restrictions may be performed.

Outbound calls to the PSTN are first processed by Communication Manager and may be subject to outbound features such as automatic route selection, digit manipulation and class of service restrictions. Once Communication Manager selects the proper SIP trunk, the call is routed to Session Manager. Session Manager once again uses the configured dial patterns (or regular expressions) to determine the route to the Avaya SBCE. From the Avaya SBCE, the call is sent to the Cincinnati Bell Business SIP Trunking Service.

For inbound calls, CBTS sends 10 digits in the source headers (i.e., From, PAI, and Contact) and destination headers (i.e., Request-URI and To). For outbound calls, Communication Manager was configured to send 10 digits in the source headers and 11 digits (1 + 10) in the destination headers.

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Avaya IP Telephony Solution Components	
Equipment/Software	Release/Version
Avaya Aura® System Manager running on a VMware Virtual Platform	7.0 SP2 (Software Update Revision 7.0.0.2.4416)
Avaya Aura® Session Manager running on a VMware Virtual Platform	7.0 SP2 (Build 7.0.0.2.700201)
Avaya Aura® Communication Manager running on a VMware Virtual Platform	7.0 SP3.1 (R017x.00.0.441.0-22903)
Avaya G450 Media Gateway	37.19.0
Avaya Aura® Media Server running on a VMware Virtual Platform	7.7
Avaya Aura® Messaging running on a VMware Virtual Platform	6.3.3 SP3
Avaya Session Border Controller for Enterprise	7.0 SP1 (7.0.1-03-8739)
Avaya 1616 IP Deskphone (H.323) running Avaya one-X® Deskphone Value Edition	1.3 SP5 (1.3.50B)
Avaya 9641G IP Deskphone (H.323) running Avaya one-X® Deskphone Edition	6.6 (6.6029U)
Avaya 9611G IP Deskphone (SIP) running Avaya one-X® Deskphone SIP Edition	7.0.0 (7.0.0.39)
Avaya one-X® Communicator (H.323 or SIP)	6.2 SP10 (Build 6.2.10.03-FP10)
Avaya Communicator for Windows	2.1.3.80
Cincinnati Bell Business SIP Trunking Service Components	
Equipment/Software	Release/Version
Oracle Acme Packet Net-Net SD 6300 Session Border Controller (SBC)	ScZ7.2.0
BroadSoft BroadWorks	R20

Table 1: Equipment and Software Tested

The specific configuration above was used for the compliance testing. Note that this solution will be compatible with other Avaya Server and Media Gateway platforms running similar versions of Communication Manager and Session Manager.

5. Configure Avaya Aura® Communication Manager

This section describes the procedure for configuring Communication Manager for the Cincinnati Bell Business SIP Trunking Service. A SIP trunk is established between Communication Manager and Session Manager for use by traffic to and from CBTS. It is assumed the general installation of Communication Manager, the Avaya Media Gateway, Media Server and Session Manager has been previously completed and is not discussed here.

The Communication Manager configuration was performed using the System Access Terminal (SAT). Some screens in this section have been abridged and highlighted for brevity and clarity in presentation. Note that the IP addresses and phone numbers shown throughout these Application Notes have been edited so that the actual public IP addresses of the network elements and public PSTN numbers are not revealed.

5.1. Licensing and Capacity

Use the **display system-parameters customer-options** command to verify that the **Maximum Administered SIP Trunks** value on **Page 2** is sufficient to support the desired number of simultaneous SIP calls across all SIP trunks at the enterprise including any trunks to the service provider. The example shows that **24000** SIP trunks are available and **30** are in use. The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity.

display system-parameters customer-options		Page	2 of 12
OPTIONAL FEATURES			
IP PORT CAPACITIES		USED	
Maximum Administered H.323 Trunks:		12000	0
Maximum Concurrently Registered IP Stations:		18000	2
Maximum Administered Remote Office Trunks:		12000	0
Maximum Concurrently Registered Remote Office Stations:		18000	0
Maximum Concurrently Registered IP eCons:		414	0
Max Concur Registered Unauthenticated H.323 Stations:		100	0
Maximum Video Capable Stations:		41000	0
Maximum Video Capable IP Softphones:		18000	6
Maximum Administered SIP Trunks:		24000	30
Maximum Administered Ad-hoc Video Conferencing Ports:		24000	0
Maximum Number of DS1 Boards with Echo Cancellation:		522	0

5.2. System Features

Use the **change system-parameters features** command to set the **Trunk-to-Trunk Transfer** field to **all** to allow incoming calls from the PSTN to be transferred to another PSTN endpoint. If for security reasons incoming calls should not be allowed to transfer back to the PSTN then leave the field set to **none**.

```
change system-parameters features                               Page 1 of 19
      FEATURE-RELATED SYSTEM PARAMETERS
        Self Station Display Enabled? y
          Trunk-to-Trunk Transfer: all
        Automatic Callback with Called Party Queuing? n
        Automatic Callback - No Answer Timeout Interval (rings): 3
          Call Park Timeout Interval (minutes): 10
        Off-Premises Tone Detect Timeout Interval (seconds): 20
          AAR/ARS Dial Tone Required? y
```

On **Page 9**, verify that a text string has been defined to replace the Calling Party Number (CPN) for restricted or unavailable calls. This text string is entered in the two fields highlighted below. The compliance test used the value of **restricted** and **unavailable** respectively.

```
change system-parameters features                               Page 9 of 19
      FEATURE-RELATED SYSTEM PARAMETERS

      CPN/ANI/ICLID PARAMETERS
        CPN/ANI/ICLID Replacement for Restricted Calls: restricted
        CPN/ANI/ICLID Replacement for Unavailable Calls: unavailable

        International Access Code: 011

      SCCAN PARAMETERS
        Enable Enbloc Dialing without ARS FAC? n

      CALLER ID ON CALL WAITING PARAMETERS
        Caller ID on Call Waiting Delay Timer (msec): 200
```

5.3. IP Node Names

Use the **change node-names ip** command to verify that node names have been previously defined for the IP addresses of the server running Communication Manager (**procr**) and for Session Manager (**SM**). These node names will be needed for defining the service provider signaling group in **Section 5.6**.

change node-names ip		Page 1 of 2
IP NODE NAMES		
Name	IP Address	
AAM	192.168.67.147	
AMS	192.168.67.203	
SM	192.168.67.47	
default	0.0.0.0	
gateway	192.168.67.1	
procr	192.168.67.202	
procr6	::	

5.4. Codecs

Use the **change ip-codec-set** command to define a list of codecs to use for calls between the enterprise and the service provider. To configure the codecs, enter the codecs in the **Audio Codec** column of the table in the order of preference defined by the service provider. For the compliance test, codec set 2 was configured with codecs G.711MU and G.729A. Default values can be used for all other fields.

change ip-codec-set 2

Page 1 of 2

IP CODEC SET

Codec Set: 2

Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size(ms)
1: G.711MU	n	2	20
2: G.729A	n	2	20
3:			

On **Page 2**, in general, the **FAX Mode** is set to **t.38-G711-fallback** to allow the fax call to fallback to G.711 fax if the call terminates on a gateway in the CBTS network that does not support T.38. However, in the case of CBTS this setting will result in all outbound fax calls using G.711 fax due to the observation in **Section 2.2**. To force the use of T.38, the **FAX Mode** may be set to **t.38-standard**. However, if the far-end gateway does not support T.38 then the fax call will fail.

change ip-codec-set 2				Page	2 of 2
IP CODEC SET					
Allow Direct-IP Multimedia? n					
	Mode	Redundancy		Packet Size (ms)	
FAX	t.38-G711-fallback	0	ECM: y		
Modem	off	0			
TDD/TTY	US	3			
H.323 Clear-channel	n	0			
SIP 64K Data	n	0		20	

5.5. IP Network Region

Create a separate IP network region for the service provider trunk. This allows for separate codec or quality of service settings to be used (if necessary) for calls between the enterprise and the service provider versus calls within the enterprise or elsewhere. For the compliance test, IP network region 2 was chosen for the service provider trunk. Use the **change ip-network-region 2** command to configure region 2 with the following parameters:

- Set the **Authoritative Domain** field to match the SIP domain of the enterprise. In this configuration, the domain name is **customera.com**. This name appears in the “From” header of SIP messages originating from this IP region.
- Enter a descriptive name in the **Name** field.
- Enable **IP-IP Direct Audio** (shuffling) to allow audio traffic to be sent directly between IP endpoints without using media resources in the Avaya Media Gateway or Media Server. Set both **Intra-region** and **Inter-region IP-IP Direct Audio** to **yes**. This is the default setting. Shuffling can be further restricted at the trunk level on the Signaling Group form.
- Set the **Codec Set** field to the IP codec set defined in **Section 5.4**.
- Default values can be used for all other fields.

```
change ip-network-region 2                                     Page 1 of 20

                                IP NETWORK REGION

Region: 2
Location: 1             Authoritative Domain: customera.com
Name: SP Region         Stub Network Region: n
MEDIA PARAMETERS       Intra-region IP-IP Direct Audio: yes
Codec Set: 2           Inter-region IP-IP Direct Audio: yes
UDP Port Min: 16384    IP Audio Hairpinning? n
UDP Port Max: 32767

Idle Traffic Interval (sec): 20
Keep-Alive Interval (sec): 5
Keep-Alive Count: 5
```

On **Page 4**, define the IP codec set to be used for traffic between region 2 and region 1. Enter the desired IP codec set in the **codec set** column of the row with destination region (**dst rgn**) **1**. Default values may be used for all other fields. The example below shows the settings used for the compliance test. The first entry indicates that codec set 2 will be used for calls between region 2 (the service provider region) and region 1 (the rest of the enterprise). Creating this table entry for IP network region 2 will automatically create a complementary table entry on the IP network region 1 form for destination region 2. This complementary table entry can be viewed using the **display ip-network-region 1** command and navigating to **Page 4** (not shown).

change ip-network-region 2										Page	4	of	20
Source Region: 2 Inter Network Region Connection Management										I		M	
										G	A	t	
dst	codec	direct	WAN-BW-limits	Video	Intervening	Dyn	A	G	c				
rgn	set	WAN	Units	Total Norm	Prio Shr	Regions	CAC	R	L	e			
1	2	y	NoLimit					n		t			
2	2								all				
3	2	y	NoLimit					n		t			

5.6. Signaling Group

Use the **add signaling-group** command to create a signaling group between Communication Manager and Session Manager for use by the service provider trunk. This signaling group is used for inbound and outbound calls between the service provider and the enterprise. For the compliance test, signaling group 2 was used for this purpose and was configured using the parameters highlighted below.

- Set the **Group Type** field to **sip**.
- Set the **Transport Method** to the recommended default value of **tls** (Transport Layer Security). For ease of troubleshooting during testing, the compliance test was conducted with the **Transport Method** set to **tcp**. The transport method specified here is used between Communication Manager and Session Manager. If TLS is used here, it must also be used on the Session Manager entity link defined in **Section 6.6**.
- Set the **IMS Enabled** field to **n**. This specifies Communication Manager will serve as an Evolution Server for Session Manager.
- Set the **Peer Detection Enabled** field to **y**. The **Peer-Server** field will initially be set to **Others** and cannot be changed via administration. Later, the **Peer-Server** field will automatically change to **SM** once Communication Manager detects its peer as a Session Manager.
- Set the **Near-end Node Name** to **procr**. This node name maps to the IP address of Communication Manager as defined in **Section 5.3**.
- Set the **Far-end Node Name** to **SM**. This node name maps to the IP address of Session Manager as defined in **Section 5.3**.
- Set the **Near-end Listen Port** and **Far-end Listen Port** to a valid unused port instead of the default well-known port value. (For TLS, the well-known port value is 5061 and for TCP the well-known port value is 5060). At the time of Session Manager installation, a SIP connection between Communication Manager and Session Manager would have been established for use by all Communication Manager SIP traffic using the well-known port

value for TLS or TCP. By creating a new signaling group with a separate port value, a separate SIP connection is created between Communication Manager and Session Manager for SIP traffic to the service provider. As a result, any signaling group or trunk group settings (**Section 5.6** and **5.7**) will only affect the service provider traffic and not other SIP traffic at the enterprise. The compliance test was conducted with the **Near-end Listen Port** and **Far-end Listen Port** set to **5062**.

- Set the **Far-end Network Region** to the IP network region defined for the service provider in **Section 5.5**.
- Set the **Far-end Domain** to the domain of the enterprise.
- Set the **DTMF over IP** field to **rtp-payload**. This value enables Communication Manager to send DTMF transmissions using RFC 2833.
- Set **Direct IP-IP Audio Connections** to **y**. This field will enable media shuffling on the SIP trunk allowing Communication Manager to redirect media traffic from the Avaya Media Gateway and allow it to flow directly between the SIP trunk and the enterprise endpoint.
- Set the **Alternate Route Timer** to **10**. This defines the number of seconds that Communication Manager will wait for a response (other than 100 Trying) to an outbound INVITE before selecting another route. If an alternate route is not defined, then the call is cancelled after this interval.
- Default values may be used for all other fields.

add signaling-group 2		Page 1 of 2

	Alternate Route Timer(sec): 10	

5.7. Trunk Group

Use the **add trunk-group** command to create a trunk group for the signaling group created in **Section 5.6**. For the compliance test, trunk group 2 was configured using the parameters highlighted below.

- Set the **Group Type** field to **sip**.
- Enter a descriptive name for the **Group Name**.
- Enter an available trunk access code (TAC) that is consistent with the existing dial plan in the **TAC** field.
- Set the **Service Type** field to **public-ntwrk**.
- Set **Member Assignment Method** to **auto**.
- Set the **Signaling Group** to the signaling group shown in the previous section.
- Set the **Number of Members** field to the number of trunk members in the SIP trunk group. This value determines how many simultaneous SIP calls can be supported by this trunk.
- Default values were used for all other fields.

```
add trunk-group 2                                     Page 1 of 21
                                                    TRUNK GROUP
Group Number: 2                Group Type: sip        CDR Reports: y
  Group Name: Service Provider  COR: 1              TN: 1        TAC: 602
  Direction: two-way          Outgoing Display? n
  Dial Access? n              Night Service:
Queue Length: 0
Service Type: public-ntwrk    Auth Code? n
                               Member Assignment Method: auto
                               Signaling Group: 2
                               Number of Members: 10
```

On **Page 2**, the **Redirect On OPTIM Failure** value is the amount of time (in milliseconds) that Communication Manager will wait for a response (other than 100 Trying) to a pending INVITE sent to an EC500 remote endpoint before selecting another route. If another route is not defined, then the call is cancelled after this interval.

Verify that the **Preferred Minimum Session Refresh Interval** is set to a value acceptable to the service provider. This value defines the interval that re-INVITEs or UPDATE messages must be sent to keep the active session alive. For the compliance test, the value of **300** seconds was used.

```
add trunk-group 2                                     Page 2 of 21
  Group Type: sip
  TRUNK PARAMETERS
    Unicode Name: auto
    Redirect On OPTIM Failure: 5000
    SCCAN? n                                           Digital Loss Group: 18
    Preferred Minimum Session Refresh Interval(sec): 300
    Disconnect Supervision - In? y Out? y
    XOIP Treatment: auto    Delay Call Setup When Accessed Via IGAR? n
```

On **Page 3**, set the **Numbering Format** field to **private**. This field specifies the format of the calling party number (CPN) sent to the far-end. Beginning with Communication Manager 6.0, public numbers are automatically preceded with a + sign (E.164 numbering format) when passed in the SIP From, Contact and P-Asserted Identity headers. To remove the + sign, the **Numbering Format** was set to **private** and the **Numbering Format** in the route pattern was set to **unk-unk** (see **Section 5.9**).

Set the **Replace Restricted Numbers** and **Replace Unavailable Numbers** fields to **y**. This will allow the CPN displayed on local endpoints to be replaced with the value set in **Section 5.2**, if the inbound call requests CPN block. For outbound calls, these same settings request that CPN block be activated on the far-end destination if a local user requests CPN block on a particular call routed out this trunk. Default values were used for all other fields.

add trunk-group 2		Page 3 of 21
TRUNK FEATURES		
ACA Assignment? n	Measured: none	Maintenance Tests? y
Numbering Format: private		
UI Treatment: service-provider		
Replace Restricted Numbers? y		
Replace Unavailable Numbers? y		
Hold/Unhold Notifications? y		
Modify Tandem Calling Number: no		
Show ANSWERED BY on Display? y		

On **Page 4**, set the **Network Call Redirection** field may be set to **y** or **n**. Setting the **Network Call Redirection** flag to **y** enables use of the SIP REFER message for call transfer; otherwise the SIP INVITE message will be used for call transfer. Both approaches are supported with this solution.

Set the **Send Diversion Header** field to **y** and the **Support Request History** field to **n**. The **Send Diversion Header** field provides additional information to the network if the call has been redirected.

add trunk-group 2	Page 4 of 21

5.8. Calling Party Information

The calling party number is sent in the SIP “From”, “Contact” and “PAI” headers. Since **Numbering Format** was set to **private** on the trunk group form (**Section 5.7**), use the **change private-numbering** command to create an entry for each extension which has a DID assigned. The DID number will be assigned by the SIP service provider. It is used to authenticate the caller.

In the sample configuration, the first four DID numbers provided for testing were assigned to the four extensions 19101, 19102, 19103, and 19104. Thus, these same DID numbers were used in the outbound calling party information on the service provider trunk when calls were originated from these extensions.

change private-numbering 5					Page 1 of 2
NUMBERING - PRIVATE FORMAT					
Ext	Ext	Trk	Private	Total	
Len	Code	Grp(s)	Prefix	Len	
5	1	1		5	Total Administered: 43
5	2	1		5	Maximum Entries: 540
5	3	1		5	
5	4	1		5	
5	19101	2	5135551234	10	
5	19102	2	5135551235	10	
5	19103	2	5135551236	10	
5	19104	2	5135551237	10	

In a real customer environment, normally the DID number is comprised of the local extension plus a prefix. If this is true, then a single private numbering entry can be applied for all extensions. In the example below, on trunk 2, all stations with a 5-digit extension beginning with 1 will send the calling party number as the **Private Prefix** plus the extension number.

change private-numbering 5					Page 1 of 2
NUMBERING - PRIVATE FORMAT					
Ext	Ext	Trk	Private	Total	
Len	Code	Grp(s)	Prefix	Len	
5	1	1		5	Total Administered: 2
5	1	2	51355	10	Maximum Entries: 540

5.9. Outbound Routing

In these Application Notes, the Automatic Route Selection (ARS) feature is used to route outbound calls via the SIP trunk to the service provider. In the sample configuration, the single digit 9 is used as the ARS access code. Enterprise callers will dial 9 to reach an “outside line”. This common configuration is illustrated below with little elaboration. Use the **change dialplan analysis** command to define a dialed string beginning with 9 of length 1 as a dial access code (dac).

change dialplan analysis			DIAL PLAN ANALYSIS TABLE						Page 1 of 12
			Location: all			Percent Full: 2			
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	
0	1	attd							
1	5	ext							
2	5	ext							
3	5	ext							
4	5	ext							
411	3	udp							
5	5	ext							
6	3	dac							
7	3	dac							
8	1	dac							
9	1	dac							
*	3	fac							
#	3	fac							

Use the **change feature-access-codes** command to configure **9** as the **Auto Route Selection (ARS) – Access Code 1**.

change feature-access-codes			FEATURE ACCESS CODE (FAC)						Page 1 of 10
			Abbreviated Dialing List1 Access Code: *21						
			Abbreviated Dialing List2 Access Code: *22						
			Abbreviated Dialing List3 Access Code: *23						
			Abbreviated Dial - Prgm Group List Access Code: *24						
			Announcement Access Code: *25						
			Answer Back Access Code: *26						
			Auto Alternate Routing (AAR) Access Code: 8						
			Auto Route Selection (ARS) - Access Code 1: 9			Access Code 2:			
			Automatic Callback Activation: *30			Deactivation: #30			
			Call Forwarding Activation Busy/DA: *31 All: *32			Deactivation: #32			
			Call Forwarding Enhanced Status: *33 Act: *34			Deactivation: #34			

Use the **change ars analysis** command to configure the routing of dialed digits following the first digit 9. The example below shows a subset of the dialed strings tested as part of the compliance test. See **Section 2.1** for the complete list of call types tested. All dialed strings are mapped to route pattern 2 which contains the SIP trunk to the service provider (as defined next).

change ars analysis 0							Page 1 of 2
ARS DIGIT ANALYSIS TABLE							
Location: all							Percent Full: 1
Dialed String	Total Min	Total Max	Route Pattern	Call Type	Node Num	ANI Req'd	
0	1	1	2	op		n	
0	11	11	2	op		n	
011	12	18	2	intl		n	
1513	11	11	2	fnpa		n	
1732	11	11	2	fnpa		n	
1800	11	11	2	fnpa		n	
1877	11	11	2	fnpa		n	
1908	11	11	2	fnpa		n	
411	3	3	2	svcl		n	

The route pattern defines which trunk group will be used for an outgoing call and performs any necessary digit manipulation. Use the **change route-pattern** command to configure the parameters for the service provider route pattern in the following manner. The example below shows the values used for route pattern 2 during the compliance test.

- **Pattern Name:** Enter a descriptive name.
- **Grp No:** Enter the outbound trunk group for the SIP service provider. For the compliance test, trunk group **2** was used.
- **FRL:** Set the Facility Restriction Level (**FRL**) field to a level that allows access to this trunk for all users that require it. The value of **0** is the least restrictive level.
- **Pfx Mrk:** Set the prefix mark (**Pfx Mrk**) to **1**. This will prefix any FNPA 10-digit number with a 1 and leave numbers of any other length unchanged. This will ensure 1 + 10 digits are sent to the service provider for long distance numbers within the North American Numbering Plan (NANP).
- **Numbering Format:** **unk-unk** All calls using this route pattern will use the private numbering table. See setting of the **Numbering Format** in the trunk group form for full details in **Section 5.7**.

change route-pattern 2												Page 1 of 3	
Pattern Number: 2												Pattern Name: SP Route	
SCCAN? n		Secure SIP? n		Used for SIP stations? n

3:								n user					
4:								n user					
5:								n user					
6:								n user					
BCC VALUE		TSC	CA-TSC	ITC BCIE		Service/Feature		PARM	Sub Dgts	Numbering Format	LAR		
0 1 2 M 4 W			Request										
1:	y y y y y n	n		rest						unk-unk	none		
2:	y y y y y n	n		rest							none		
3:	y y y y y n	n		rest							none		
4:	y y y y y n	n		rest							none		
5:	y y y y y n	n		rest							none		
6:	y y y y y n	n		rest							none		

Use the **save translation** command to save all Communication Manager configuration described in **Section 5**.

6. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. The procedures include configuring the following items:

- SIP Domain
- Location
- Adaptation Modules
- SIP Entities
- Entity Links
- Routing Policies
- Dial Patterns
- Session Manager

It may not be necessary to create all the items above when creating a connection to the service provider since some of these items would have already been defined as part of the initial Session Manager installation. This includes items such as certain SIP Domains, Locations, SIP Entities, and Session Manager itself. However, each item should be reviewed to verify the configuration.

6.1. Avaya Aura® System Manager Login and Navigation

Session Manager configuration is accomplished by accessing the browser-based GUI of System Manager, using the URL “https://<ip-address>/SMGR”, where “<ip-address>” is the IP address of System Manager. Log in with the appropriate credentials and click on **Login** (not shown). The following page is displayed. The links displayed below will be referenced in subsequent sections to navigate to items requiring configuration. Most items will be located under the **Elements** → **Routing** link highlighted below.

Clicking the **Elements** → **Routing** link, displays the **Introduction to Network Routing Policy** page. In the left-hand pane is a navigation tree containing many of the items to be configured in the following sections.

6.2. Specify SIP Domain

Create a SIP Domain for each domain for which Session Manager will need to be aware in order to route calls. For the compliance test, this includes the enterprise domain (**customera.com**) as defined in **Section 5.5**. Navigate to **Routing → Domains** in the left-hand navigation pane (**Section 6.1**) and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Name:** Enter the domain name.
- **Type:** Select **sip** from the pull-down menu.
- **Notes:** Add a brief description (optional).

Click **Commit**. The screen below shows the entry for the enterprise domain.

CommitCancel

1 Item 

Filter: [Enable](#)

Name	Type	Notes
* <input type="text" value="customera.com"/>	<input type="text" value="sip"/> ▼	<input type="text"/>

6.3. Add Location

Locations can be used to identify logical and/or physical locations where SIP Entities reside for purposes of bandwidth management and call admission control. A single Location was defined for the enterprise. The screens below show the addition of the Location named **Main**, which includes all equipment at the enterprise including Communication Manager, Session Manager and the Avaya SBCE.

To add a Location, navigate to **Routing → Locations** in the left-hand navigation pane (**Section 6.1**) and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Name:** Enter a descriptive name for the Location.
- **Notes:** Add a brief description (optional).

* **Name:**

Notes:

Click **Commit** to save.

The enterprise equipment (e.g., Communication Manager, Session Manager and the Avaya SBCE) will be associated with this location through the configuration of their respective SIP Entities in **Section 6.5**.

6.4. Add Adaptation

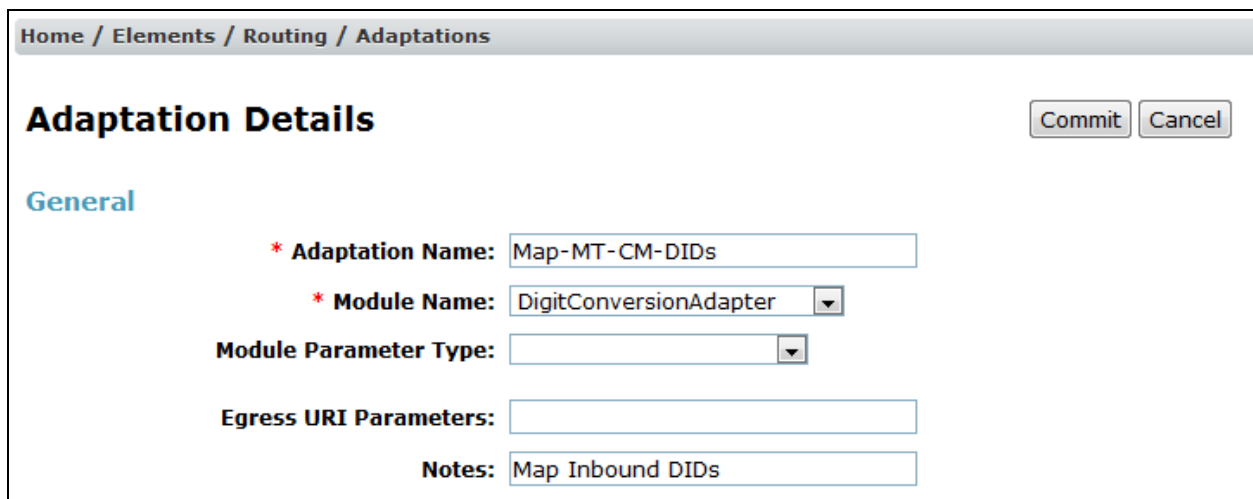

Session Manager can be configured with Adaptations that can modify SIP messages before or after routing decisions have been made or perform digit manipulation. The Adaptation **DigitConversionAdapter** supports digit conversion of telephone numbers in specific headers of SIP messages.

For the compliance test, two Adaptations were used. The first Adaptation was applied to the Communication Manager SIP Entity and performs the mapping of inbound DID numbers from CBTS to local Communication Manager extensions. The second Adaptation was applied to the Avaya SBCE SIP Entity and it removes SIP headers that are not used by the service provider.

To create the Adaptation that will be applied to the Communication Manager SIP Entity, navigate to **Routing → Adaptations** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Adaptation Name:** Enter a descriptive name for the Adaptation (e.g., **Map-MT-CM-DIDs**).
- **Module Name:** Select **DigitConversionAdapter** from the drop-down menu.
- **Module Parameter Type:** Leave blank.
- **Notes:** Enter a description (optional).

* **Module Name:** DigitConversionAdapter ▼

Module Parameter Type: ▼

Egress URI Parameters:

Notes: Map Inbound DIDs

To map inbound DID numbers from CBTS to Communication Manager extensions, scroll down to the **Digit Conversion for Outgoing Calls from SM** section. Create an entry for each DID to be mapped. Click **Add** and enter the following values for each mapping. Use default values for all remaining fields.

- **Matching Pattern:** Enter a digit string used to match the inbound DID number.
- **Min:** Enter a minimum dialed number length used in the match criteria.
- **Max:** Enter a maximum dialed number length used in the match criteria.
- **Delete Digits** Enter the number of digits to delete from the beginning of the received number.
- **Insert Digits:** Enter the digits to insert at the beginning of the received number.
- **Address to modify:** Select **destination** since this digit conversion only applies to the destination number.

Click **Commit** to save.

Digit Conversion for Outgoing Calls from SM								
Add		Remove						
11 Items								Filter: Enable
<input type="checkbox"/>	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation D
<input type="checkbox"/>	* 5135551234	* 10	* 10		* 10	19101	destination	
<input type="checkbox"/>	* 5135551235	* 10	* 10		* 10	19102	destination	
<input type="checkbox"/>	* 5135551236	* 10	* 10		* 10	19103	destination	
<input type="checkbox"/>	* 5135551237	* 10	* 10		* 10	19104	destination	

In a real customer environment, often the DID number is comprised of the local extension plus a prefix. If this is true, then a single digit conversion entry can be created for all extensions. In the example below, a 5 digit prefix is deleted from each incoming DID number leaving a 5 digit extension to be routed by Session Manager.

Digit Conversion for Outgoing Calls from SM								
Add		Remove						
11 Items								Filter: Enable
<input type="checkbox"/>	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation D
<input type="checkbox"/>	* 51355	* 10	* 10		* 5		destination	

To create the Adaptation that will be applied to the Avaya SBCE SIP Entity, click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Adaptation Name:** Enter a descriptive name for the Adaptation (e.g., **Service-Provider-General**).
- **Module Name:** Select **DigitConversionAdapter** from the drop-down menu.
- **Module Parameter Type:** Enter **Name-Value Parameter**. This section will expand with an area to enter **Name** and **Value** pairs. Click **Add**. To remove headers on the egress side of Session Manager (i.e., towards the Avaya SBCE) enter the keyword **eRHdrs** in the **Name** field and a comma-separated list of headers to remove in the **Value** field. For the compliance test, the list of removed headers included **AV-Correlation-ID, AV-Global-Session-ID, Endpoint-View, P-AV-Message-ID, P-Charging-Vector** and **P-Location**.
- **Notes:** Enter a description (optional).

6.5. Add SIP Entity

A SIP Entity must be added for Session Manager and for each SIP telephony system connected to Session Manager which includes Communication Manager and the Avaya SBCE. Navigate to **Routing → SIP Entities** in the left-hand navigation pane (**Section 6.1**) and click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Name:** Enter a descriptive name.
- **FQDN or IP Address:** Enter the FQDN or IP address of the SIP Entity that is used for SIP signaling.
- **Type:** Enter **Session Manager** for Session Manager, **CM** for Communication Manager and **SIP Trunk** for the Avaya SBCE.
- **Notes:** Brief description (optional)
- **Adaptation:** This field is only present if **Type** is not set to **Session Manager**. If applicable, select the appropriate **Adaptation** created in **Section 6.4** that will be applied to this entity.
- **Location:** Select the Location that applies to the SIP Entity being created. For the compliance test, all components were located in Location **Main** created in **Section 6.3**.
- **Time Zone:** Select the time zone for the Location above.

The following screen shows the addition of Session Manager. The IP address of the virtual SM-100 Security Module is entered for **FQDN or IP Address**.

The screenshot shows the 'SIP Entity Details' form in the Avaya Session Manager interface. The breadcrumb navigation at the top reads 'Home / Elements / Routing / SIP Entities'. The form is titled 'SIP Entity Details' and has 'Commit' and 'Cancel' buttons in the top right corner. The 'General' section is active, showing the following fields: 'Name' (required, value: 'asm'), 'FQDN or IP Address' (required, value: '192.168.67.47'), 'Type' (dropdown menu, value: 'Session Manager'), 'Notes' (text area, value: 'Expressway'), 'Location' (dropdown menu, value: 'Main'), 'Outbound Proxy' (dropdown menu, empty), 'Time Zone' (dropdown menu, value: 'America/New_York'), and 'Credential name' (text area, empty). Below the 'General' section is the 'SIP Link Monitoring' section, which contains a 'SIP Link Monitoring' dropdown menu with the value 'Use Session Manager Configuration'.

To define the ports used by Session Manager, scroll down to the **Port** section of the **SIP Entity Details** screen. This section is only present for **Session Manager** SIP Entities.

In the **Port** section, click **Add** and enter the following values. Use default values for all remaining fields:

- **Listen Port:** Port number on which Session Manager can listen for SIP requests.
- **Protocol:** Transport protocol to be used with this port.
- **Default Domain:** The default domain associated with this port. For the compliance test, this was the enterprise SIP domain.

Defaults can be used for the remaining fields. Click **Commit** to save.

Three port entries are shown in the screenshot below. The first two are standard ports used for SIP traffic: port 5060 for TCP and port 5061 for TLS. These ports were provisioned as part of the Session Manager installation not covered by this document. In addition, port 5062 defined in **Section 5.6** for use with service provider SIP traffic between Communication Manager and Session Manager was added to the list.

Listen Ports

TCP Failover port:

TLS Failover port:

4 Items Filter: [Enable](#)

<input type="checkbox"/>	Listen Ports	Protocol	Default Domain	Notes
<input type="checkbox"/>	5060	TCP	customera.com	<input type="text"/>
<input type="checkbox"/>	5061	TLS	customera.com	<input type="text"/>
<input type="checkbox"/>	5062	TCP	customera.com	<input type="text"/>

The following screen shows the addition of Communication Manager. Typically, when Session Manager is first installed, a SIP Entity and Entity Link is created for Communication Manager to carry intra-enterprise SIP traffic. In order for Session Manager to separate SIP service provider traffic on a separate Entity Link to Communication Manager, the creation of a second SIP Entity for Communication Manager is needed. The **FQDN or IP Address** field is set to the IP address of Communication Manager. For the **Adaptation** field, select the Adaptation previously defined for dial plan digit manipulation in **Section 6.4**. The **Location** field is set to **Main** which is the Location where Communication Manager resides (**Section 6.3**).

Use Session Manager Configuration

6.6. Add Entity Links

A SIP trunk between Session Manager and a telephony system is described by an Entity Link. Two Entity Links were created: one to Communication Manager for use only by service provider traffic and one to the Avaya SBCE. To add an Entity Link, navigate to **Routing → Entity Links** in the left-hand navigation pane (**Section 6.1**) and click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Name:** Enter a descriptive name.
- **SIP Entity 1:** Select the Session Manager SIP Entity (**Section 6.5**).
- **Protocol:** Select the transport protocol used for this link.
- **Port:** Port number on which Session Manager will receive SIP requests from the far-end.
- **SIP Entity 2:** Select the name of the other system using the SIP Entity name defined in **Section 6.5**.
- **Port:** Port number on which the other system receives SIP requests from Session Manager.
- **Connection Policy:** Select **trusted** from pull-down menu.

Click **Commit** to save.

For the Communication Manager Entity Link (**sm_ACM_public_5062_TCP**), the protocol and ports defined here must match the values used on the Communication Manager signaling group form in **Section 5.6**. Specifically, the following fields must match:

- **Protocol** must match the **Transport Method** from **Section 5.6**. For the compliance test, the TCP protocol was used but the recommended configuration is to use TLS.
- SIP Entity 1 **Port** must match the **Far-end Listen Port** from **Section 5.6**.
- **SIP Entity 2** must match the SIP Entity defined for Communication Manager in **Section 6.5**.
- SIP Entity 2 **Port** must match the **Near-End Listen Port** from **Section 5.6**.

For the Avaya SBCE Entity Link (**VNJ-SBCE1-Link**), the protocol and ports defined here must match the values used on the Avaya SBCE in **Section 7**. Specifically, the following fields must match:

- **Protocol** must match the protocol used by the Avaya SBCE Routing profile to reach Session Manager. This value is shown in the **Next Hop Address** in **Section 7.11.1**.
- SIP Entity 1 **Port** must match the port value used by the Avaya SBCE Routing profile to reach Session Manager. This value is shown in the **Next Hop Address** in **Section 7.11.1**.
- **SIP Entity 2** must match the SIP Entity defined for the Avaya SBCE in **Section 6.5**.
- SIP Entity 2 **Port** must match the port value defined in the Avaya SBCE internal signaling interface in **Section 7.3** for the selected protocol.

The screen below shows the completed Entity Links for both Communication Manager and the Avaya SBCE.

6.7. Add Routing Policies

Routing Policies describe the conditions under which calls will be routed to the SIP Entities specified in **Section 6.5**. Two Routing Policies must be added: one for Communication Manager and one for the Avaya SBCE. To add a Routing Policy, navigate to **Routing → Routing Policies** in the left-hand navigation pane (**Section 6.1**) and click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Name:** Enter a descriptive name.
- **Notes:** Add a brief description (optional).

In the **SIP Entity as Destination** section, click **Select**. The **SIP Entity List** page opens (not shown). Select the appropriate SIP Entity to which this Routing Policy applies and click **Select**. The selected SIP Entity displays on the **Routing Policy Details** page as shown below. Use default values for remaining fields. Click **Commit** to save.

The following screen shows the Routing Policy for Communication Manager.

The screenshot shows the 'Routing Policy Details' page in a web application. The breadcrumb trail at the top is 'Home / Elements / Routing / Routing Policies'. There is a 'Help ?' link in the top right. The page title is 'Routing Policy Details'. Below the title are 'Commit' and 'Cancel' buttons. The 'General' section contains the following fields: 'Name' (required, value: 'ACM_Public'), 'Disabled' (checkbox, unchecked), 'Retries' (required, value: '0'), and 'Notes' (text area, empty). The 'SIP Entity as Destination' section has a 'Select' button above a table. The table has four columns: 'Name', 'FQDN or IP Address', 'Type', and 'Notes'. It contains one row with the values 'ACM_public', '192.168.67.202', 'CM', and an empty 'Notes' field.

Name	FQDN or IP Address	Type	Notes
ACM_public	192.168.67.202	CM

6.8. Add Dial Patterns

Dial Patterns are needed to route calls through Session Manager. For the compliance test, Dial Patterns were needed to route calls from Communication Manager to CBTS and vice versa. Dial Patterns define which Route Policy will be selected for a particular call based on the dialed digits, destination domain and originating location. To add a Dial Pattern, navigate to **Routing → Dial Patterns** in the left-hand navigation pane (**Section 6.1**) and click on the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields.

- **Pattern:** Enter a dial string that will be matched against the Request-URI of the call.
- **Min:** Enter a minimum length used in the match criteria.
- **Max:** Enter a maximum length used in the match criteria.
- **SIP Domain:** Enter the destination domain used in the match criteria.
- **Notes:** Add a brief description (optional).

In the **Originating Locations and Routing Policies** section, click **Add**. From the **Originating Locations and Routing Policy List** that appears (not shown), select the appropriate originating location for use in the match criteria. Lastly, select the Routing Policy from the list that will be used to route all calls that match the specified criteria. Click **Select**.

Default values can be used for the remaining fields. Click **Commit** to save.

Two examples of the Dial Patterns used for the compliance test are shown below. The first example shows that outbound long distance numbers (11 digits) that begin with **1908** to **ALL** destination domains from **ALL** locations use route policy **VNJ-SBCE1-RP**.

Select : All, None

The second example shows that incoming DID numbers (10 digits) that start with **513555** to domain **customera.com** and originating from **ALL** locations use route policy **ACM_Public**. These are the DID numbers assigned to the enterprise from CBTS. All other Dial Patterns used as part of the compliance test were configured in a similar manner.

6.9. Add/View Session Manager

The creation of a Session Manager element provides the linkage between System Manager and Session Manager. This is most likely done as part of the initial Session Manager installation. To add a Session Manager, from the **Home** page, navigate to **Elements → Session Manager → Session Manager Administration** in the left-hand navigation pane (**Section 6.1**) and click on the **New** button in the right pane (not shown). If the Session Manager already exists, select the appropriate Session Manager and click **View** (not shown) to view the configuration. Enter/verify the data as described below and shown in the following screen:

In the **General** section, enter the following values:

- **SIP Entity Name:** Select the SIP Entity created for Session Manager.
- **Description:** Add a brief description (optional).
- **Management Access Point Host Name/IP:** Enter the host name or IP address of the Session Manager management interface.

The screen below shows the Session Manager values used for the compliance test.

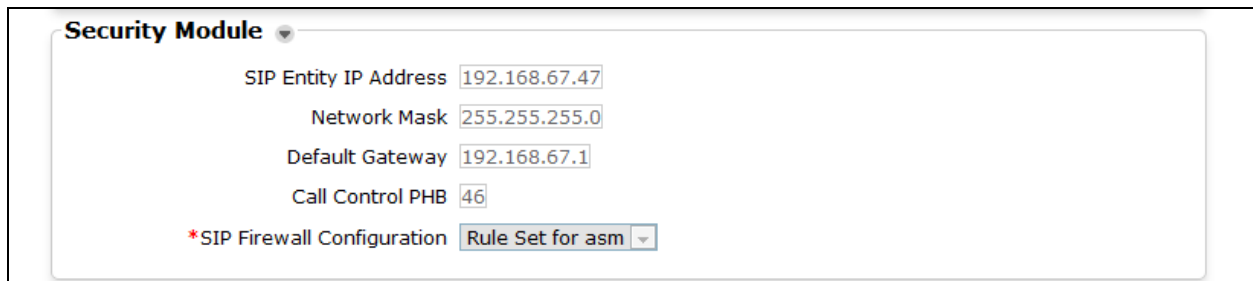

The screenshot displays the 'View Session Manager' configuration page. The breadcrumb trail at the top reads 'Home / Elements / Session Manager'. A 'Return' button is located in the top right corner. Below the title, there is a navigation bar with links: 'General | Security Module | Monitoring | CDR | Personal Profile Manager (PPM) - Connection Settings | Event Server |'. Below this, there are links for 'Expand All' and 'Collapse All'. The 'General' section is expanded, showing the following fields:

- SIP Entity Name:
- Description:
- Management Access Point Host Name/IP:
- Direct Routing to Endpoints:
- Maintenance Mode: ☐

In the **Security Module** section, enter the following values:

- **SIP Entity IP Address:** Should be filled in automatically based on the SIP Entity Name. Otherwise, enter the IP address of the Session Manager signaling interface.
- **Network Mask:** Enter the network mask corresponding to the IP address of Session Manager.
- **Default Gateway:** Enter the IP address of the default gateway for Session Manager.

Use default values for the remaining fields. Click **Save** (not shown) to add this Session Manager. The screen below shows the remaining Session Manager values used for the compliance test.

The screenshot displays the 'Security Module' configuration window. It contains the following fields and values:

Field	Value
SIP Entity IP Address	192.168.67.47
Network Mask	255.255.255.0
Default Gateway	192.168.67.1
Call Control PHB	46
* SIP Firewall Configuration	Rule Set for asm

7. Configure Avaya Session Border Controller for Enterprise

This section describes the configuration of the Avaya SBCE. It is assumed that the initial installation of the Avaya SBCE has been completed including the assignment of a management IP address. The management interface must be provisioned on a different subnet than either the Avaya SBCE private or public network interfaces (e.g., A1 and B1).

On all screens described in this section, it is assumed that parameters are left at their default values unless specified otherwise.

7.1. Access the Management Interface

Use a web browser to access the web interface by entering the URL **https://<ip-addr>**, where **<ip-addr>** is the management IP address assigned during installation. The Avaya SBCE login page will appear as shown below. Log in with appropriate credentials.

The image shows the login page for the Avaya Session Border Controller for Enterprise. On the left, there is a large red 'AVAYA' logo and the text 'Session Border Controller for Enterprise' in bold black font. On the right, under the heading 'Log In', there are input fields for 'Username:' (containing 'ucsec') and 'Password:'. Below these fields is a 'Log In' button. To the right of the login fields, there is a block of text stating that the system is restricted to authorized users and that unauthorized access is prohibited. Below this, another block of text states that the use of the system may be monitored and recorded for administrative and security reasons. At the bottom, there is a copyright notice: '© 2011 - 2015 Avaya Inc. All rights reserved.'

7.2. Verify Network Configuration and Enable Interfaces

To view the network information provided during installation, navigate to **System Management**. In the right pane, click **View** highlighted below.

A System Information page will appear showing the information provided during installation. In the **Appliance Name** field is the name of the device (**sp-ucsec1**). This name will be referenced in other configuration screens. The two **Network Configuration** entries highlighted below are the only two IP addresses that are directly related to the SIP trunking solution described in these Application Notes. Interfaces **A1** and **B1** represent the private and public interfaces of the Avaya SBCE respectively. Each of these interfaces must be enabled after installation.

7.3. Signaling Interface

A signaling interface defines an IP address, protocols and listen ports that the Avaya SBCE can use for signaling. Create a signaling interface for both the internal and external sides of the Avaya SBCE.

To create a new interface, navigate to **Device Specific Settings → Signaling Interface** in the left pane. In the center pane, select the Avaya SBCE device (**sp-ucsec1**) to be managed. In the right pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new interface, followed by one or more pop-up windows in which the interface parameters can be configured. Once complete, the settings are shown in the far right pane.

For the compliance test, signaling interface **Int_Sig_Intf** was created for the Avaya SBCE internal interface and signaling interface **Ext_Sig_Intf** was created for the Avaya SBCE external interface. Each is highlighted below. When configuring the interfaces, configure the parameters as follows:

- Set **Name** to a descriptive name.
- For the internal interface, set the **Signaling IP** to the IP address associated with the private interface (A1) defined in **Section 7.2**. For the external interface, set the **Signaling IP** to the IP address associated with the public interface (B1) defined in **Section 7.2**.
- In the **UDP Port**, **TCP Port** and **TLS Port** fields, enter the port the Avaya SBCE will listen on for each transport protocol. For the internal interface, the Avaya SBCE was configured to listen for TCP on port 5060. For the external interface, the Avaya SBCE was configured to listen for UDP or TCP on port 5060. Since CBTS will send messages using UDP on port 5060, it would have been sufficient to simply configure the Avaya SBCE for UDP.

The screenshot shows the Avaya Session Border Controller for Enterprise web interface. The left sidebar contains a navigation menu with options like Dashboard, Administration, Backup/Restore, System Management, and Device Specific Settings. The 'Signaling Interface' option is highlighted. The main content area is titled 'Signaling Interface: sp-ucsec1'. It features a table with columns: Name, Signaling IP, TCP Port, UDP Port, TLS Port, TLS Profile, and Edit/Delete links. The table lists four interfaces: Int_Sig_Intf, Ext_Sig_Intf, RW_Ext_Sig, and RW_Int_Sig. The first two interfaces are highlighted with a red border. A warning message at the top states: 'Modifying or deleting an existing signaling interface will require an application restart before taking effect. Application restarts can be issued from System Management.'

Name	Signaling IP	TCP Port	UDP Port	TLS Port	TLS Profile	
Int_Sig_Intf	10.32.128.18 Network_A1 (A1, VLAN 0)	5060	—	—	None	Edit Delete
Ext_Sig_Intf	192.168.96.228 Network_B1-2 (B1, VLAN 0)	5060	5060	—	None	Edit Delete
RW_Ext_Sig	192.168.96.229 Network_B1-2 (B1, VLAN 0)	5060	—	5061	AvayaSBCServer	Edit Delete
RW_Int_Sig	10.32.128.19 Network_A1 (A1, VLAN 0)	5060	—	5061	AvayaSBCServer	Edit Delete

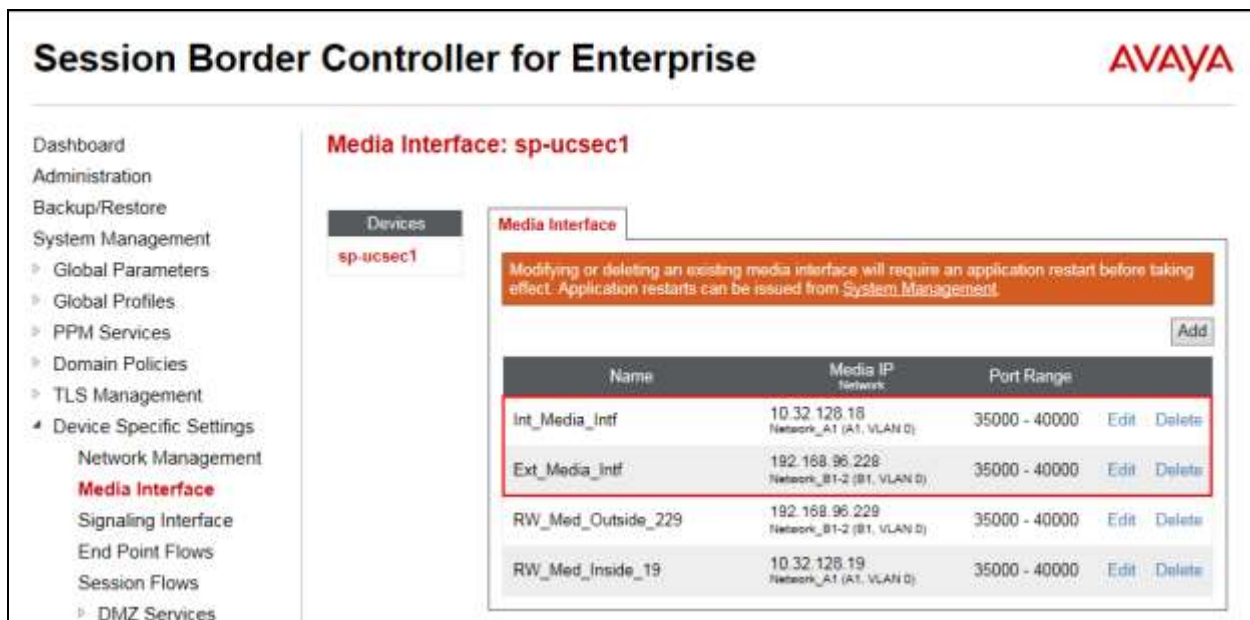

7.4. Media Interface

A media interface defines an IP address and port range for transmitting media. Create a media interface for both the internal and external sides of the Avaya SBCE.

To create a new interface, navigate to **Device Specific Settings → Media Interface** in the left pane. In the center pane, select the Avaya SBCE device (**sp-ucsec1**) to be managed. In the right pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new interface, followed by one or more pop-up windows in which the interface parameters can be configured. Once complete, the settings are shown in the far right pane.

For the compliance test, media interface **Int_Media_Intf** was created for the Avaya SBCE internal interface and media interface **Ext_Media_Intf** was created for the Avaya SBCE external interface. Each is highlighted below. When configuring the interfaces, configure the parameters as follows:

- Set **Name** to a descriptive name.
- For the internal interface, set the **Media IP** to the IP address associated with the private interface (A1) defined in **Section 7.2**. For the external interface, set the **Media IP** to the IP address associated with the public interface (B1) defined in **Section 7.2**.
- Set **Port Range** to a range of ports acceptable to both the Avaya SBCE and the far-end. For the compliance test, the default port range was used for both interfaces.

Session Border Controller for Enterprise **AVAYA**

Media Interface: sp-ucsec1

Modifying or deleting an existing media interface will require an application restart before taking effect. Application restarts can be issued from [System Management](#).

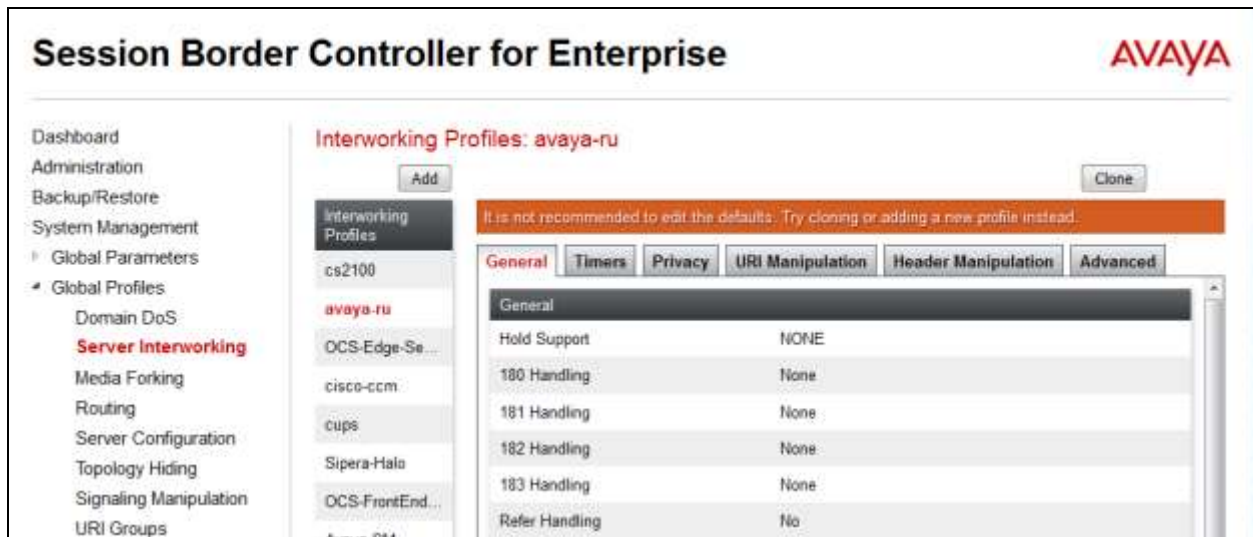

Media Interface

Name	Media IP Network	Port Range	Edit	Delete
Int_Media_Intf	10.32.128.18 Network_A1 (A1, VLAN 0)	35000 - 40000	Edit	Delete
Ext_Media_Intf	192.168.96.228 Network_B1-2 (B1, VLAN 0)	35000 - 40000	Edit	Delete
RW_Med_Outside_229	192.168.96.229 Network_B1-2 (B1, VLAN 0)	35000 - 40000	Edit	Delete
RW_Med_Inside_19	10.32.128.19 Network_A1 (A1, VLAN 0)	35000 - 40000	Edit	Delete

7.5. Server Interworking

A server interworking profile defines a set of parameters that aid in interworking between the Avaya SBCE and a connected server. Create a server interworking profile for Session Manager and the service provider SIP server. These profiles will be applied to the appropriate server in **Sections 7.6.1** and **7.6.2**.

To create a new profile, navigate to **Global Profiles → Server Interworking** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new profile, followed by one or more pop-up windows in which the profile parameters can be configured. Once complete, the settings are shown in the far right pane. Alternatively, a new profile may be created by selecting an existing profile in the center pane and clicking the **Clone** button in the right pane. This will create a copy of the selected profile which can then be edited as needed. To view the settings of an existing profile, select the profile from the center pane. The settings will appear in the right pane.

7.5.1. Server Interworking – Session Manager

For the compliance test, server interworking profile **Avaya-SM-T38** was created for Session Manager by cloning the existing profile **avaya-ru**. **T.38 Support** was set to **Yes**. Highlighted values in this section indicate changes from the cloned profile or the default value. The **General** tab parameters are shown below.

General	Timers	Privacy	URI Manipulation	Header Manipulation	Advanced
General					
Hold Support	NONE				
180 Handling	None				
181 Handling	None				
182 Handling	None				
183 Handling	None				
Refer Handling	No

Send Hold	No				
Delayed Offer	No				
3xx Handling	No				
Diversion Header Support	No				
Delayed SDP Handling	No				
Re-Invite Handling	No				
Prack Handling	No				
Allow 18X SDP	No				
T.38 Support	Yes				
URI Scheme	SIP				
Via Header Format	RFC3261				
<input type="button" value="Edit"/>					

The **Timers**, **Privacy**, **URI Manipulation**, **Header Manipulation** tabs have no entries.

The **Advanced** tab parameters are shown below.

General	Timers	Privacy	URI Manipulation	Header Manipulation	Advanced
Record Routes		Both Sides			
Include End Point IP for Context Lookup		Yes			
Extensions		Avaya			
Diversion Manipulation		No			
Has Remote SBC		Yes			
Route Response on Via Port		No			
DTMF					
DTMF Support		None			
Edit					

7.5.2. Server Interworking – CBTS

For the compliance test, server interworking profile **SP-General-T38** was created for the CBTS SIP server. When creating the profile, the default values were used for all parameters with the exception that **T.38 Support** was set to **Yes**. The **General** tab parameters are shown below.

General	
Hold Support	NONE
180 Handling	None
181 Handling	None
182 Handling	None
183 Handling	None
Refer Handling	No
URI Group	None
Send Hold	No

7.6. Server Configuration

A server configuration profile defines the attributes of the physical server. Create a server configuration profile for Session Manager and the service provider SIP server.

To create a new profile, navigate to **Global Profiles → Server Configuration** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new profile, followed by one or more pop-up windows in which the profile parameters can be configured. Once complete, the profile name will appear under **Server Profiles** in the center pane and the settings will be shown in the far right pane. If a profile already exists, then the settings of the existing profile may be viewed by selecting the profile from the center pane. The settings will appear in the right pane.

7.6.1. Server Configuration – Session Manager

For the compliance test, server configuration profile **Expway-SM** was created for Session Manager. When creating the profile, configure the **General** tab parameters as follows:

- Set **Server Type** to **Call Server**.
- Enter a valid combination of **IP Address / FQDN**, **Port** and **Transport** that Session Manager will use to listen for SIP requests. The standard SIP UDP/TCP port is 5060. The standard SIP TLS port is 5061. Additional combinations can be entered by clicking the **Add** button (not shown).

The screenshot displays the configuration interface for a Session Manager profile. At the top right are buttons for 'Rename', 'Clone', and 'Delete'. Below these are four tabs: 'General' (selected), 'Authentication', 'Heartbeat', and 'Advanced'. The 'General' tab contains a 'Server Type' dropdown set to 'Call Server'. Below this is a table with three columns: 'IP Address / FQDN', 'Port', and 'Transport'. The table contains two entries: one for IP 192.168.67.47 on port 5060 using TCP, and another for the same IP on port 5061 using TLS. An 'Edit' button is located at the bottom of the table.

IP Address / FQDN	Port	Transport
192.168.67.47	5060	TCP
192.168.67.47	5061	TLS

The **Authentication** and **Heartbeat** tabs have no entries.

On the **Advanced** tab, check **Enable Grooming** and set the **Interworking Profile** field to the interworking profile for Session Manager defined in **Section 7.5.1**. Set the **TLS Client Profile** to the profile containing the proper TLS certificates for the customer environment. A complete description of the use of TLS certificates are beyond the scope of these Application Notes.

Edit

7.6.2. Server Configuration – CBTS

For the compliance test, server configuration profile **SP-CBTS** was created for CBTS. When creating the profile, configure the **General** tab parameters as follows:

- Set **Server Type** to **Trunk Server**.
- Enter a valid combination of **IP Address / FQDN**, **Port** and **Transport** that the CBTS SIP proxy will use to listen for SIP requests. This information is provided by CBTS. Additional combinations can be entered by clicking the **Add** button (not shown).

Edit

7.7. Application Rules

An application rule defines the allowable SIP applications and associated parameters. An application rule is one component of the larger endpoint policy group defined in **Section 7.10**. For the compliance test, the predefined **default-trunk** application rule (shown below) was used for both Session Manager and the CBTS SIP server.

To view an existing rule, navigate to **Domain Policies → Application Rules** in the left pane. In the center pane, select the rule (e.g., **default-trunk**) to be viewed.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The left navigation pane shows the hierarchy: Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies, and Application Rules (highlighted). Under Application Rules, the 'default-trunk' rule is selected. The main content area shows the configuration for this rule. A warning message states: 'It is not recommended to edit the defaults. Try cloning or adding a new rule instead.' The configuration table lists the following parameters:

Application Type	In	Out	Maximum Concurrent Sessions	Maximum Sessions Per Endpoint
Audio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	2000	2000
Video	<input type="checkbox"/>	<input type="checkbox"/>		

Below the table, the 'Miscellaneous' section includes:

CDR Support	None
RTCP Keep-Alive	No

The interface also includes an 'Add' button, a 'Filter By Device...' dropdown, a 'Clone' button, and an 'Edit' button at the bottom right of the configuration area.

7.8. Media Rules

A media rule defines the processing to be applied to the selected media. A media rule is one component of the larger endpoint policy group defined in **Section 7.10**. For the compliance test, the predefined **default-low-med** media rule (shown below) was used for both Session Manager and the CBTS SIP server.

To view an existing rule, navigate to **Domain Policies → Media Rules** in the left pane. In the center pane, select the rule (e.g., **default-low-med**) to be viewed.

The contents of the **default-low-med** media rule are described below.

The **Media Encryption** tab shows the **Preferred Formats** field for both Audio Encryption and Video Encryption is set to **RTP** (as opposed to **SRTP**) indicating that no encryption was used.

On the **Media Silencing** tab, **Media Silencing** is disabled.

The screenshot shows a configuration interface with five tabs: Media Encryption, Media Silencing (highlighted in red), Media QoS, Media BFCP, and Media FECC. Below the tabs is a section titled 'Media Silencing' with a single checkbox that is unchecked. An 'Edit' button is located at the bottom right of the section.

The **Media QoS** settings are shown below. This QoS setting is not a requirement for interoperability and QoS is not tested as part of the compliance test. If the QoS setting shown here does not meet the needs of the customer then the media rule should be cloned and modified as per customer requirements.

The screenshot shows a configuration interface with five tabs: Media Encryption, Media Silencing, Media QoS (highlighted in red), Media BFCP, and Media FECC. Below the tabs are two sections. The first section is titled 'Media QoS Reporting' and contains a checkbox for 'RTCP Enabled' which is unchecked. The second section is titled 'Media QoS Marking' and contains a checkbox for 'Enabled' which is unchecked. An 'Edit' button is located at the bottom right of the section.

On the **Media BFCP** tab, BFCP is disabled.

The screenshot shows a configuration interface with five tabs: Media Encryption, Media Silencing, Media QoS, Media BFCP (highlighted in red), and Media FECC. Below the tabs is a section titled 'Binary Floor Control Protocol' with a checkbox for 'BFCP Enabled' which is unchecked. An 'Edit' button is located at the bottom right of the section.

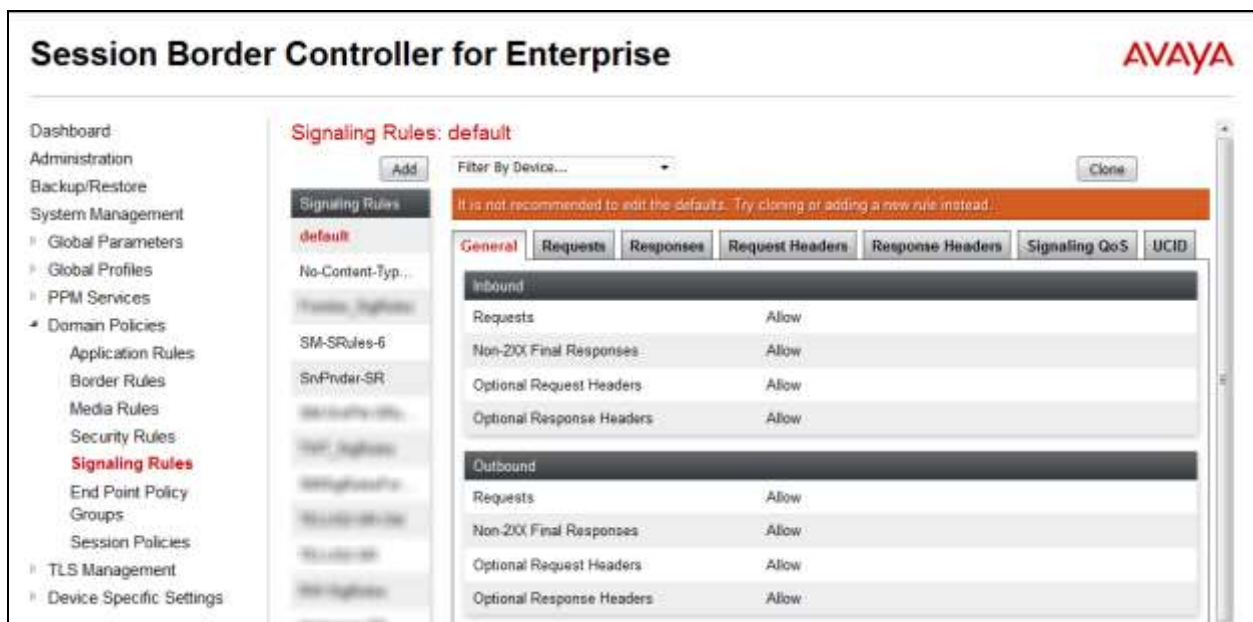

On the **Media FECC** tab, FECC is disabled.

The screenshot shows a configuration interface with five tabs: Media Encryption, Media Silencing, Media QoS, Media BFCP, and Media FECC. The Media FECC tab is selected and highlighted in red. Below the tabs is a section titled "Far End Camera Control" with a dark header. Under this header, there is a label "FECC Enabled" followed by an unchecked checkbox. At the bottom of this section is an "Edit" button.

7.9. Signaling Rules

A signaling rule defines the processing to be applied to the selected signaling traffic. A signaling rule is one component of the larger endpoint policy group defined in **Section 7.10**. A specific signaling rule was created for Session Manager and the CBTS SIP server.

To create a new rule, navigate to **Domain Policies → Signaling Rules** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new rule, followed by one or more pop-up windows in which the rule parameters can be configured. Once complete, the settings are shown in the far right pane. To view the settings of an existing rule, select the rule from the center pane. The settings will appear in the right pane.

7.9.1. Signaling Rules – Session Manager

For the compliance test, signaling rule **SM-SRules-Aura7** was created for Session Manager. **SM-SRules-Aura7** was created using all default values except the **Signaling QoS** tab.

The **General** tab settings are shown below.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
Inbound						
Requests		Allow				
Non-2XX Final Responses		Allow				
Optional Request Headers		Allow				
Optional Response Headers		Allow				
Outbound						
Requests		Allow				
Non-2XX Final Responses		Allow				
Optional Request Headers		Allow				
Optional Response Headers		Allow				
Content-Type Policy						
Enable Content-Type Checks		<input checked="" type="checkbox"/>				
Action	Allow	Multipart Action	Allow			
Exception List		Exception List				
<div>Edit</div>						

The **Requests**, **Responses**, **Request Headers**, and **Response Headers** tabs have no entries.

The **Signaling QoS** settings used for the compliance test are shown below. This QoS setting is not a requirement for interoperability and QoS is not tested as part of the compliance test. If the QoS setting shown here does not meet the needs of the customer then it should be set as per customer requirements.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
<div>Signaling QoS <input checked="" type="checkbox"/></div> <div>QoS Type DSCP</div> <div>DSCP EF</div> <div>Edit</div>						

The **UCID** setting is shown below.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
<div>UCID <input type="checkbox"/></div> <div>Edit</div>						

7.9.2. Signaling Rules – CBTS

The **CBTS-SR** signaling rule (shown below) was used for the CBTS SIP server. The **General** tab settings use the default values and are shown below.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
Inbound						
Requests		Allow				
Non-2XX Final Responses		Allow				
Optional Request Headers		Allow				
Optional Response Headers		Allow				
Outbound						
Requests		Allow				
Non-2XX Final Responses		Allow				
Optional Request Headers		Allow				
Optional Response Headers		Allow				
Content-Type Policy						
Enable Content-Type Checks		<input checked="" type="checkbox"/>				
Action	Allow	Multipart Action	Allow			
Exception List		Exception List				
<input type="button" value="Edit"/>						

The **Requests** and **Responses** tabs have no entries.

The **Requests Headers** tab shows the manipulations performed on headers of request messages. An entry is created by clicking the **Add In Header Control** or **Add Out Header Control** button depending on the direction (relative to the Avaya SBCE) of the message to be modified. The entry shown below removes the **Supported** header in all incoming (CBTS to Avaya SBCE) SIP request messages such as INVITEs and UPDATEs. This is necessary to prevent dropping of active calls. See **Section 2.2** for full details.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
---------	----------	-----------	------------------------	------------------	---------------	------

Row	Header Name	Method Name	Header Criteria	Action	Proprietary	Direction	
1	Supported	ALL	Forbidden	Remove Header	No	IN	Edit Delete

The **Response Header** tab shows the manipulations performed on headers of response messages. The entries were created in the same manner as was done on the **Request Headers** tab. The entries shown removes the **Supported** header from 1XX and 2XX responses to ALL messages in the IN direction (CBTS to Avaya SBCE). This is necessary for successful outbound calls. See **Section 2.2** for full details.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
---------	----------	-----------	-----------------	-------------------------	---------------	------

Row	Header Name	Response Code	Method Name	Header Criteria	Action	Proprietary	Direction	
1	Supported	1XX	ALL	Forbidden	Remove Header	No	IN	Edit Delete
2	Supported	2XX	ALL	Forbidden	Remove Header	No	IN	Edit Delete

The **Signaling QoS** settings are shown below. This QoS setting is not a requirement for interoperability and QoS is not tested as part of the compliance test. If the QoS setting shown here does not meet the needs of the customer then it should be set as per customer requirements.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
---------	----------	-----------	-----------------	------------------	----------------------	------

The **UCID** settings are shown below.

General	Requests	Responses	Request Headers	Response Headers	Signaling QoS	UCID
<div>UCID <input type="checkbox"/></div> <div>Edit</div>						

7.10. Endpoint Policy Groups

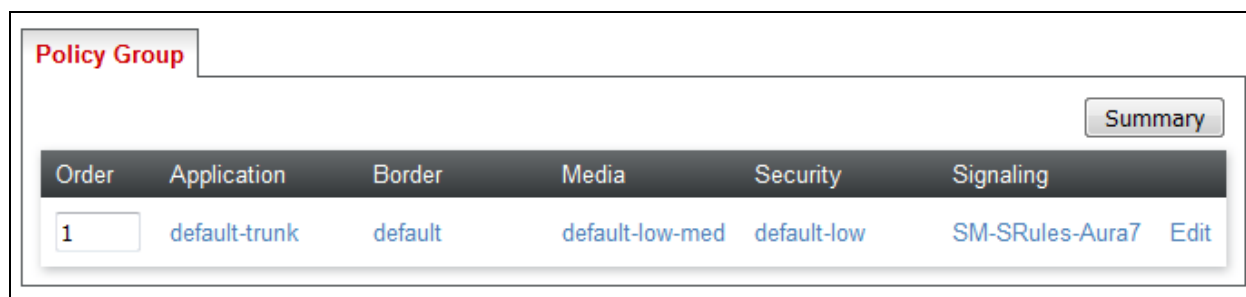

An endpoint policy group is a set of policies that will be applied to traffic between the Avaya SBCE and an endpoint (connected server). Thus, an endpoint policy group must be created for Session Manager and the service provider SIP server. The endpoint policy group is applied to the traffic as part of the endpoint flow defined in **Section 7.13**.

To create a new group, navigate to **Domain Policies → End Point Policy Groups** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new group, followed one or more of pop-up windows in which the group parameters can be configured. Once complete, the settings are shown in the far right pane. To view the settings of an existing group, select the group from the center pane. The settings will appear in the right pane.

7.10.1. Endpoint Policy Group – Session Manager

For the compliance test, endpoint policy group **SM** was created for Session Manager. Default values were used for each of the rules which comprise the group with the exception of **Application** and **Signaling**. For **Application**, enter the application rule created in **Section 7.7**. For **Signaling**, enter the signaling rule created in **Section 7.9.1**. The details of the default settings for **Media** are showed in **Section 7.8**.

7.10.2. Endpoint Policy Group – CBTS

For the compliance test, endpoint policy group **CBTS-Policy-Grp** was created for the CBTS SIP server. Default values were used for each of the rules which comprise the group with the exception of **Application** and **Signaling**. For **Application**, enter the application rule created in **Section 7.7**. For **Signaling**, enter the signaling rule created in **Section 7.9.2**. The details of the default settings for **Media** are showed in **Section 7.8**.

Policy Group						
						Summary
Order	Application	Border	Media	Security	Signaling	
1	default-trunk	default	default-low-med	default-low	CBTS-SR	Edit

7.11. Routing

A routing profile defines where traffic will be directed based on the contents of the Request-URI. A routing profile is applied only after the traffic has matched an endpoint server flow defined in **Section 7.13**. Create a routing profile for Session Manager and the service provider SIP server.

To create a new profile, navigate to **Global Profiles → Routing** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new profile, followed by one or more pop-up windows in which the profile parameters can be configured. Once complete, the settings are shown in the far right pane. To view the settings of an existing profile, select the profile from the center pane. The settings will appear in the right pane.

The screenshot displays the 'Session Border Controller for Enterprise' web interface. The left navigation pane includes 'Global Profiles' and 'Routing'. The main content area is titled 'Routing Profiles: default' and shows a list of profiles with 'default' selected. A warning message states: 'It is not recommended to edit the defaults. Try cloning or adding a new profile instead.' Below this, a 'Routing Profile' configuration table is visible.

Priority	URI Group	Time of Day	Load Balancing	Next Hop Address	Transport
1	*	default	DNS/SRV	Auto-Detect	Auto-Detect

7.11.1. Routing – Session Manager

For the compliance test, routing profile **To_ExpwaySM** was created for Session Manager. When creating the profile, configure the parameters as follows:

- Set the **URI Group** to the wild card * to match on any URI.
- Set **Load Balancing** to **Priority** from the pull-down menu.
- Enable **Next Hop Priority**.
- Click **Add** to enter the following for the Next Hop Address:
 - Set **Priority/Weight** to **1**.
 - For **Server Configuration**, select **Expway-SM (Section 7.6.1)** from the pull-down menu. The **Next Hop Address** will be filled-in automatically.

Click **Finish**.

Profile : To_ExpwaySM - Edit Rule

URI Group	*	Time of Day	default
Load Balancing	Priority	NAPTR	<input type="checkbox"/>
Transport	None	Next Hop Priority	<input checked="" type="checkbox"/>
Next Hop In-Dialog	<input type="checkbox"/>	Ignore Route Header	<input type="checkbox"/>

Add

Priority / Weight	Server Configuration	Next Hop Address	Transport	
1	Expway-SM	192.168.67.47:5060 (TCP)	None	Delete

Finish

7.11.2. Routing – CBTS

For the compliance test, routing profile **To_CBTS** was created for CBTS. When creating the profile, configure the parameters as follows:

- Set the **URI Group** to the wild card * to match on any URI.
- Set **Load Balancing** to **Priority** from the pull-down menu.
- Click **Add** to enter the following for the Next Hop Address:
 - Set **Priority/Weight** to **1**.
 - For **Server Configuration**, select **SP-CBTS** (Section 7.6.2) from the pull-down menu. The **Next Hop Address** will be filled-in automatically.

Click **Finish**.

Profile : To_CBTS - Edit Rule

URI Group	*	Time of Day	default
Load Balancing	Priority	NAPTR	<input type="checkbox"/>
Transport	None	Next Hop Priority	<input checked="" type="checkbox"/>
Next Hop In-Dialog	<input type="checkbox"/>	Ignore Route Header	<input type="checkbox"/>

Add

Priority / Weight	Server Configuration	Next Hop Address	Transport	
1	SP-CBTS	192.168.213.141:5060 (UDP)	None	Delete

Finish

7.12. Topology Hiding

Topology hiding allows the host part of some SIP message headers to be modified in order to prevent private network information from being propagated to the untrusted public network. It can also be used as an interoperability tool to adapt the host portion of these same headers to meet the requirements of the connected servers. The topology hiding profile is applied as part of the endpoint flow in **Section 7.13**.

To create a new profile, navigate to **Global Profiles → Topology Hiding** in the left pane. In the center pane, select **Add**. A pop-up window (not shown) will appear requesting the name of the new profile, followed by a pop-up window in which a header can be selected and configured. Additional headers can be added in this window. Once complete, the settings are shown in the far right pane. To view the settings of an existing profile (e.g., **default**), select the profile from the center pane. The settings will appear in the right pane.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The left navigation pane shows the hierarchy: Dashboard, Administration, Backup/Restore, System Management, Global Parameters, and Global Profiles. Under Global Profiles, the following options are listed: Domain DoS, Server Interworking, Media Forking, Routing, Server Configuration, **Topology Hiding** (highlighted in red), and Signaling Manipulation. The main content area is titled "Topology Hiding Profiles: default" and includes an "Add" button and a "Clone" button. A warning message states: "It is not recommended to edit the defaults. Try cloning or adding a new profile instead." Below this, a tab labeled "Topology Hiding" is active, showing a table with the following data:

Header	Criteria	Replace Action	Overwrite Value
From	IP/Domain	Auto	---
Via	IP/Domain	Auto	---
Request-Line	IP/Domain	Auto	---
SDP	IP/Domain	Auto	---
Referred-By	IP/Domain	Auto	---

7.12.1. Topology Hiding – Session Manager

For the compliance test, topology hiding profile **MT-Domain** was created for Session Manager. This profile will be applied to traffic from the Avaya SBCE to Session Manager. When creating the profile, configure the parameters as follows:

- Set **Header** to the header whose host part of the URI is to be modified.
- Set **Criteria** to **IP/Domain** to indicate that the host part should be modified if it is an IP address or a domain.
- Set **Replace Action** to **Auto** for all headers except **Request-Line**, **From** and **To** which should be set to **Overwrite**.
- For those headers to be overwritten, the **Overwrite Value** is set to the enterprise domain (**customera.com**).

Topology Hiding			
Header	Criteria	Replace Action	Overwrite Value
Via	IP/Domain	Auto	---
From	IP/Domain	Overwrite	customera.com
Refer-To	IP/Domain	Auto	---
To	IP/Domain	Overwrite	customera.com
Referred-By	IP/Domain	Auto	---
Record-Route	IP/Domain	Auto	---
Request-Line	IP/Domain	Overwrite	customera.com
SDP	IP/Domain	Auto	---
<div>Edit</div>			

7.12.2. Topology Hiding – CBTS

For the compliance test, topology hiding profile **SP-CBTS-TH** was created for CBTS. This profile will be applied to traffic from the Avaya SBCE to CBTS. When creating the profile, configure the parameters as follows:

- Set **Header** to the header whose host part of the URI is to be modified.
- Set **Criteria** to **IP/Domain** to indicate that the host part should be modified if it is an IP address or a domain.
- Set **Replace Action** to **Auto** for all headers except **Request-Line**, **From**, **To**, **Refer-To**, and **Referred-By** which should be set to **Overwrite**.
- For those headers to be overwritten, the **Overwrite Value** is set to the CBTS domain (**as.voip.fuse.net**).

Topology Hiding			
Header	Criteria	Replace Action	Overwrite Value
Via	IP/Domain	Auto	---
From	IP/Domain	Overwrite	as.voip.fuse.net
Refer-To	IP/Domain	Overwrite	as.voip.fuse.net
To	IP/Domain	Overwrite	as.voip.fuse.net
Referred-By	IP/Domain	Overwrite	as.voip.fuse.net
Record-Route	IP/Domain	Auto	---
Request-Line	IP/Domain	Overwrite	as.voip.fuse.net
SDP	IP/Domain	Auto	---
<input type="button" value="Edit"/>			

7.13. End Point Flows

Endpoint flows are used to determine the endpoints (connected servers) involved in a call in order to apply the appropriate policies. When a packet arrives at the Avaya SBCE, the content of the packet (IP addresses, URIs, etc) is used to determine which flow it matches. Once the flow is determined, the flow points to policies and profiles which control processing, privileges, authentication, routing, etc. Once routing is applied and the destination endpoint is determined, the policies for the destination endpoint are applied. Thus, two flows are involved in every call: the source endpoint flow and the destination endpoint flow. In the case of the compliance test, the endpoints are Session Manager and the service provider SIP server.

To create a new flow for a server endpoint, navigate to **Device Specific Settings → End Point Flows** in the left pane. In the center pane, select the Avaya SBCE device (**sp-ucsec1**) to be managed. In the right pane, select the **Server Flows** tab and click the **Add** button. A pop-up window (not shown) will appear requesting the name of the new flow and the flow parameters. Once complete, the settings are shown in the far right pane.

The screenshot displays the Avaya Session Border Controller for Enterprise (SBCE) web interface. The left sidebar contains a navigation menu with the following items: Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies, TLS Management, and Device Specific Settings. Under Device Specific Settings, the following sub-items are listed: Network Management, Media Interface, Signaling Interface, and End Point Flows (which is highlighted in red). The main content area is titled "End Point Flows: sp-ucsec1". It features a tabbed interface with "Subscriber Flows" and "Server Flows" tabs. The "Server Flows" tab is active, showing a table of server configurations. Above the table, there is a link "Click here to add a row description." and an "Add" button. The table has columns for Priority, Flow Name, URI Group, Received Interface, Signaling Interface, End Point Policy Group, and Routing Profile. Two rows are visible in the table:

Priority	Flow Name	URI Group	Received Interface	Signaling Interface	End Point Policy Group	Routing Profile	
1	Avaya-SM	*	Ext_Sig_Intf	Int_Sig_Intf	SM	To_Trunks	View Clone Edit Delete
2	RW-Avaya-SM	*	RW_Ext_Sig	RW_Int_Sig	Remote-User-SM	default	View Clone Edit Delete

7.13.1. End Point Flow – Session Manager

For the compliance test, endpoint flow **Expway-SM** was created for Session Manager. All traffic from Session Manager will match this flow as the source flow and use the specified **Routing Profile To_CBTS** to determine the destination server and corresponding destination flow. The **End Point Policy** and **Topology Hiding Profile** will be applied as appropriate. When creating the flow, configure the parameters as follows:

- For the **Flow Name**, enter a descriptive name.
- For **Server Configuration**, select the Session Manager server created in **Section 7.6.1**.
- To match all traffic, set the **URI Group**, **Transport**, and **Remote Subnet** to *.
- Set the **Received Interface** to the external signaling interface (**Section 7.3**).
- Set the **Signaling Interface** to the internal signaling interface (**Section 7.3**).
- Set the **Media Interface** to the internal media interface (**Section 7.4**).
- Set the **End Point Policy Group** to the endpoint policy group defined for Session Manager in **Section 7.10.1**.
- Set the **Routing Profile** to the routing profile defined in **Section 7.11.2** used to direct traffic to the CBTS SIP server.
- Set the **Topology Hiding Profile** to the topology hiding profile defined for Session Manager in **Section 7.12.1**.

7.13.2. End Point Flow – CBTS

For the compliance test, endpoint flow **SP-CBTS** was created for the CBTS SIP server. All traffic from CBTS will match this flow as the source flow and use the specified **Routing Profile To_ExpwaySM** to determine the destination server and corresponding destination flow. The **End Point Policy** and **Topology Hiding Profile** will be applied as appropriate. When creating the flow, configure the parameters as follows:

- For the **Flow Name**, enter a descriptive name.
- For **Server Configuration**, select the CBTS SIP server created in **Section 7.6.2**.
- To match all traffic, set the **URI Group**, **Transport**, and **Remote Subnet** to *.
- Set the **Received Interface** to the internal signaling interface (**Section 7.3**).
- Set the **Signaling Interface** to the external signaling interface (**Section 7.3**).
- Set the **Media Interface** to the external media interface (**Section 7.4**).
- Set the **End Point Policy Group** to the endpoint policy group defined for CBTS in **Section 7.10.2**.
- Set the **Routing Profile** to the routing profile defined in **Section 7.11.1** used to direct traffic to Session Manager.
- Set the **Topology Hiding Profile** to the topology hiding profile defined for CBTS in **Section 7.12.2**.

8. Cincinnati Bell Business SIP Trunking Service Configuration

CBTS is responsible for the network configuration and deployment of the Cincinnati Bell Business SIP Trunking Service.

CBTS will require that the customer provide the IP address and port number used to reach the Avaya SBCE at the edge of the enterprise. CBTS will provide the IP address and port number of the CBTS SIP proxy/SBC, IP addresses/ports of media sources, SIP domain and DID numbers assigned to the enterprise. This information is used to complete the Communication Manager, Session Manager and Avaya SBCE configuration discussed in the previous sections.

9. Verification Steps

This section provides verification steps that may be performed in the field to verify that the solution is configured properly. This section also provides a list of useful troubleshooting commands that can be used to troubleshoot the solution.

Verification Steps:

1. Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active for more than 35 seconds. This time period is included to verify that proper routing of the SIP messaging has satisfied SIP protocol timers.
2. Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active for more than 35 seconds.
3. Verify that a user on the PSTN can end an active call by hanging up.
4. Verify that an endpoint at the enterprise site can end an active call by hanging up.

Troubleshooting:

1. Communication Manager:
 - **list trace station** <extension number> - Traces calls to and from a specific station.
 - **list trace tac** <trunk access code number> - Trace calls over a specific trunk group.
 - **status station** <extension number> - Displays signaling and media information for an active call on a specific station.
 - **status trunk** <trunk access code number> - Displays real-time trunk group information.
 - **status trunk** <trunk access code number/channel number> - Displays real-time signaling and media information for an active trunk channel.
2. Session Manager:
 - **Call Routing Test** - The Call Routing Test verifies the routing for a particular source and destination. To run the routing test, navigate to **Elements → Session**

Manager → System Tools → Call Routing Test. Enter the requested data to run the test.

3. Avaya Session Border Controller for Enterprise:

There are several links and menus located on the taskbar at the top of the screen of the web interface that can provide useful diagnostic or troubleshooting information.

- **Alarms:** This option provides information about active alarms.
- **Incidents:** This option provides detailed reports of anomalies, errors, policies violations, etc.
- **Status:** This option provides statistical and current status information.
- **Diagnostics:** This option provides a variety of tools to test and troubleshoot the Avaya SBCE network connectivity.

10. Conclusion

These Application Notes describe the configuration necessary to connect Avaya Aura® Communication Manager, Avaya Aura® Session Manager and the Avaya Session Border Controller for Enterprise to the Cincinnati Bell Business SIP Trunking Service. The Cincinnati Bell Business SIP Trunking Service provides businesses a flexible, cost-saving alternative to traditional hardwired telephony trunks. Please refer to **Section 2.2** for exceptions or workarounds.
