

## **Application Notes for configuring Avaya Aura® Communication Manager R7.0, Avaya Aura® Session Manager 7.0 and Avaya Session Border Controller for Enterprise R7.0 to support Colt SIP Trunk - Issue 1.0**

### **Abstract**

These Application Notes describe the steps used to configure Session Initiation Protocol (SIP) trunking between Colt SIP Trunk and an Avaya SIP enabled Enterprise Solution. The Avaya solution consists of Avaya Session Border Controller for Enterprise, Avaya Aura® Session Manager and Avaya Aura® Communication Manager as an Evolution Server. Colt is a member of the DevConnect Service Provider program.

Readers should pay attention to Section 2, in particular the scope of testing as outlined in Section 2.1 as well as the observations noted in Section 2.2, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

# 1. Introduction

These Application Notes describe the steps used to configure Session Initiation Protocol (SIP) trunking between the Colt SIP Trunk and an Avaya SIP-enabled enterprise solution. The Avaya solution consists of the following: Avaya Aura® Communication Manager R7.0 (Communication Manager); Avaya Aura® Session Manager R7.0 (Session Manager); Avaya Session Border Controller for Enterprise R7.0 (Avaya SBCE). Note that the shortened names shown in brackets will be used throughout the remainder of the document. Customers using this Avaya SIP-enabled enterprise solution with the Colt SIP Trunk are able to place and receive PSTN calls via a dedicated Internet connection and the SIP protocol. This converged network solution is an alternative to traditional PSTN trunks. This approach generally results in lower cost for the enterprise customer.

## 2. General Test Approach and Test Results

The general test approach was to configure a simulated enterprise site using an Avaya SIP telephony solution consisting of Communication Manager, Session Manager and Avaya SBCE. The enterprise site was configured to connect to the Colt SIP Trunk.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

### 2.1. Interoperability Compliance Testing

The interoperability test included the following:

- Incoming calls to the enterprise site from PSTN phones using the Colt SIP Trunk, calls made to SIP and H.323 telephones at the enterprise.
- Outgoing calls from the enterprise site completed via the Colt SIP Trunk to PSTN destinations, calls made from SIP and H.323 telephones.
- Calls using the G.729A, G.711A and G.726-32 codecs.
- Fax calls to/from a group 3 fax machine to a PSTN connected fax machine using T.38.
- DTMF transmission using RFC 2833 with successful Voice Mail/Vector navigation for inbound and outbound calls.
- User features such as hold and resume, transfer, conference, call forwarding, etc.
- Caller ID Presentation and Caller ID Restriction.
- Direct IP-to-IP media between the Avaya SBCE and the SIP and H.323 telephones.
- Call coverage and call forwarding for endpoints at the enterprise site.
- Transmission and response of SIP OPTIONS messages sent by the Colt SIP Trunk requiring Avaya response and sent by Avaya requiring Colt response.

## 2.2. Test Results

Interoperability testing of the sample configuration was completed with successful results for the Colt SIP Trunk with the following observations:

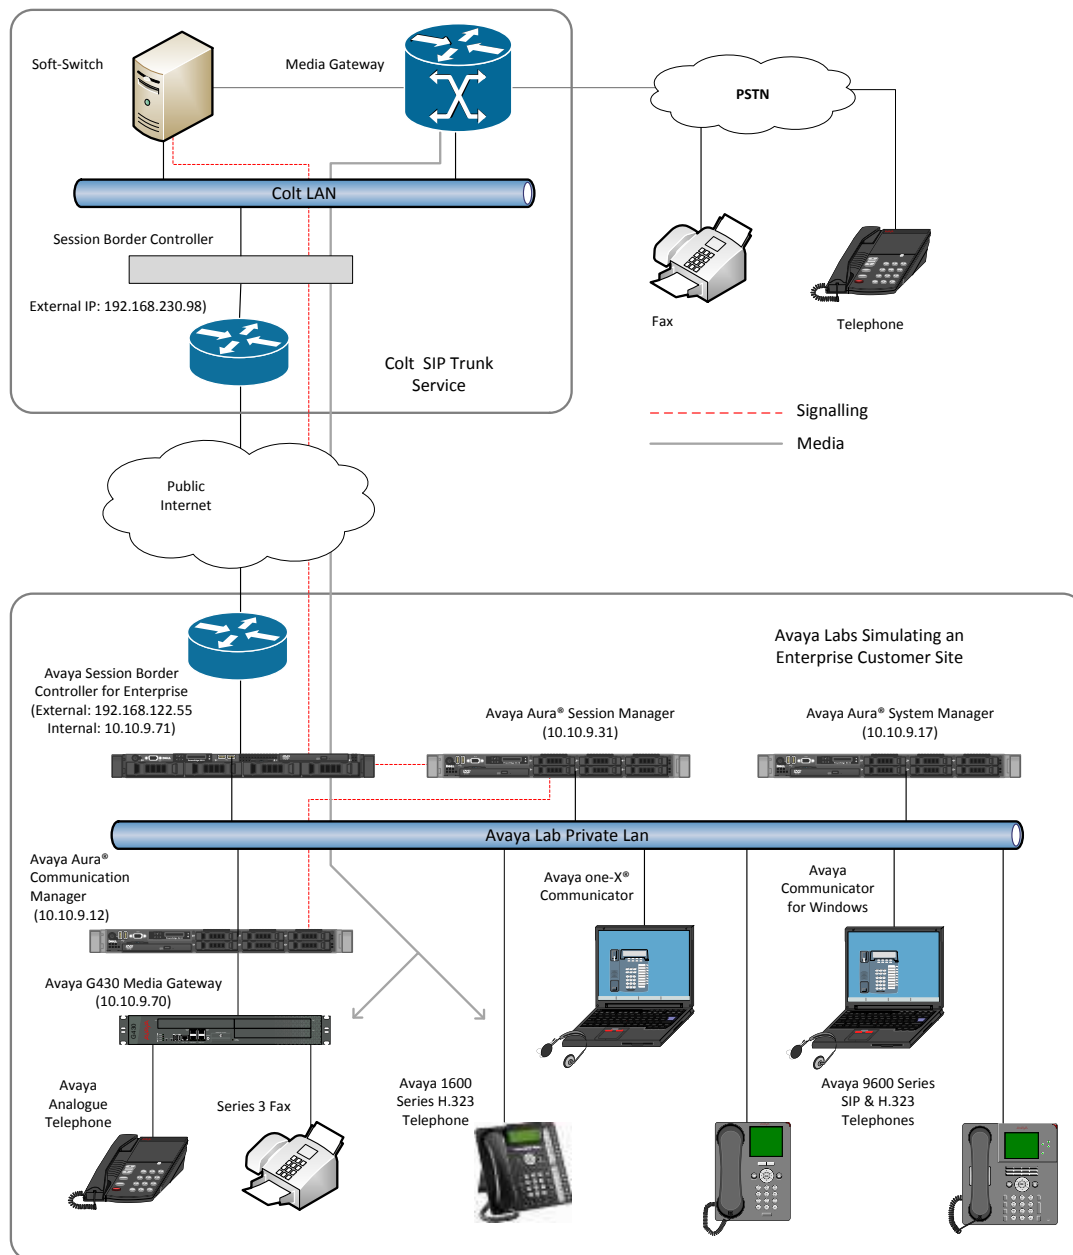

- No OPTIONS were received from the network during testing. This was noted as under certain failure conditions, call failures may not be handled as effectively as possible.
- When testing outbound calls with no matching codec, the network responded to the INVITE with a 180 Ringing and an alternative codec listed in the SDP. A more appropriate response in this case is “488 Not Acceptable Here”. Communication Manager sent a CANCEL and failure tone was heard on the calling phone.
- No inbound Toll-Free access was available to test.
- Routing was not in place to test Operator or Directory Enquiries calls.
- Emergency calls were not tested as there was no test call booked with the Emergency Services Operator.
- Initial testing of outbound T.38 Fax calls was unsuccessful. When the network sent a re-INVITE to change to T.38 and Communication Manager responded with 200 OK, the network did not send an ACK. After repeated sending of 200 OK, Communication Manager released the call. A fix was put in place by Colt and outbound Fax was retested successfully.
- When testing congestion and failure of the SIP Trunk, it was approximately 15 seconds before a failure tone was heard on the calling phone. This was because the call was re-attempted from the network a number of times before it was rejected.

## 2.3. Support

For technical support on Colt products please contact Colt on 0800 358 3999 or visit their website at [www.colt.net](http://www.colt.net)

### 3. Reference Configuration

**Figure 1** illustrates the test configuration. The test configuration shows an enterprise site connected to the Colt SIP Trunk. Located at the enterprise site are an Avaya SBCE, Session Manager and a Communication Manager. Endpoints are Avaya 9600 series and Avaya 96x1 series IP telephones (with SIP and H.323 firmware), Avaya 1600 series IP telephones (with H.323 firmware), Avaya analogue telephones and an analogue fax machine. Also included in the test configuration was an Avaya one-X® Communicator soft phone and Avaya Communicator for Windows running on laptop PCs.

**Figure 1: Test Setup Colt SIP Trunk to Avaya Enterprise**

## 4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Equipment/Software	Release/Version
<b>Avaya</b>	
Avaya Aura® Session Manager running on a Virtual Platform.	7.0.0.0.700007
Avaya Aura® System Manager	7.0.0.0.16266
Avaya Aura® Communication Manager	7.0-441 Build 0.22477
Avaya Session Border Controller for Enterprise	7.0.0-21-6602
Avaya G430 Media Gateway	37.19.0
Avaya 9630G Phone (SIP)	2_6_14_5
Avaya 9608 Phone (SIP)	7.0.0 R39
Avaya 9670G Phone (H.323)	3.230A
Avaya 9608 Phone (H.323)	6.3116
Avaya 1616 Phone (H.323)	1.380B
Avaya One-X® Communicator	6.2.7.03-SP7
Avaya Communicator for Windows	2.1.2.75
Avaya 2400 Series Digital Handsets	N/A
Analogue Handset	N/A
Analogue Fax	N/A
<b>Colt</b>	
Sonus GSX	9.2.4
Sonus PSX	V08.04.08A002

## 5. Configure Avaya Aura® Communication Manager

This section describes the steps for configuring Communication Manager for SIP Trunking. SIP trunks are established between Communication Manager and Session Manager. These SIP trunks will carry SIP signalling associated with the Colt SIP Trunk. For incoming calls, Session Manager receives SIP messages from the Avaya SBCE and directs the incoming SIP messages to Communication Manager. Once the message arrives at Communication Manager further incoming call treatment, such as incoming digit translations and class of service restrictions may be performed. All outgoing calls to the PSTN are processed within Communication Manager and may be first subject to outbound features such as automatic route selection, digit manipulation and class of service restrictions. Once Communication Manager selects a SIP trunk, the SIP signalling is routed to Session Manager. Session Manager directs the outbound SIP messages to the Avaya SBCE at the enterprise site that then sends the SIP messages to the Colt network. Communication Manager configuration was performed using the System Access Terminal (SAT). Some screens in this section have been abridged and highlighted for brevity and clarity in presentation. The general installation of the Servers and Avaya G430 Media Gateway is presumed to have been previously completed and is not discussed here.

### 5.1. Confirm System Features

The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity. Use the **display system-parameters customer-options** command and on **Page 2**, verify that the **Maximum Administered SIP Trunks** supported by the system is sufficient for the combination of trunks to the Colt SIP Trunk, and any other SIP trunks used.

display system-parameters customer-options			Page	2	of	12
OPTIONAL FEATURES						
IP PORT CAPACITIES			USED			
Maximum Administered H.323 Trunks:			4000	0		
Maximum Concurrently Registered IP Stations:			2400	3		
Maximum Administered Remote Office Trunks:			4000	0		
Maximum Concurrently Registered Remote Office Stations:			2400	0		
Maximum Concurrently Registered IP eCons:			68	0		
Max Concur Registered Unauthenticated H.323 Stations:			100	0		
Maximum Video Capable Stations:			2400	0		
Maximum Video Capable IP Softphones:			2400	0		
<b>Maximum Administered SIP Trunks:</b>			<b>4000</b>	<b>20</b>		
Maximum Administered Ad-hoc Video Conferencing Ports:			4000	0		
Maximum Number of DS1 Boards with Echo Cancellation:			80	0		

On **Page 5**, verify that **IP Trunks** field is set to **y**.

display system-parameters customer-options		Page 5 of 12
OPTIONAL FEATURES		
Emergency Access to Attendant? y	IP Stations? y	
Enable 'dadmin' Login? y		
Enhanced Conferencing? y	ISDN Feature Plus? n	
Enhanced EC500? y	ISDN/SIP Network Call Redirection? y	
Enterprise Survivable Server? n	ISDN-BRI Trunks? y	
Enterprise Wide Licensing? n	ISDN-PRI? y	
ESS Administration? y	Local Survivable Processor? n	
Extended Cvg/Fwd Admin? y	Malicious Call Trace? y	
External Device Alarm Admin? y	Media Encryption Over IP? n	
Five Port Networks Max Per MCC? n	Mode Code for Centralized Voice Mail? n	
Flexible Billing? n		
Forced Entry of Account Codes? y	Multifrequency Signaling? y

Hospitality (Basic)? y	Multimedia Call Handling (Enhanced)? y	
Hospitality (G3V3 Enhancements)? y	Multimedia IP SIP Trunking? y	
IP Trunks? y		
IP Attendant Consoles? y		

## 5.2. Administer IP Node Names

The node names defined here will be used in other configuration screens to define a SIP signalling group between Communication Manager and Session Manager. In the **IP Node Names** form, assign the node **Name** and **IP Address** for Session Manager. In this case, **Session\_Manager** and **10.10.9.31** are the **Name** and **IP Address** for the Session Manager SIP interface. Also note the **procr** IP address as this is the processor interface that Communication Manager will use as the SIP signalling interface to Session Manager.

display node-names ip		IP NODE NAMES
Name	IP Address	
<b>Session_Manager</b>	<b>10.10.9.31</b>	
default	0.0.0.0	
<b>procr</b>	<b>10.10.9.12</b>	
procr6	::	

### 5.3. Administer IP Network Region

Use the **change ip-network-region 1** command to set the following values:

- The **Authoritative Domain** field is configured to match the domain name configured on Session Manager. In this configuration, the domain name is **avaya.com**.
- By default, **IP-IP Direct Audio** (both **Intra-** and **Inter-Region**) is enabled (**yes**) to allow audio traffic to be sent directly between endpoints without using gateway VoIP resources. When a PSTN call is shuffled, the media stream is established directly between the enterprise end-point and the internal media interface of the Avaya SBCE.
- The **Codec Set** is set to the number of the IP codec set to be used for calls within the IP network region. In this case, codec set **1** is used.
- The rest of the fields can be left at default values.

```
change ip-network-region 1                                     Page 1 of 20
                                                                IP NETWORK REGION
    Region: 1
    Location: 1          Authoritative Domain: avaya.com
        Name: default      Stub Network Region: n
MEDIA PARAMETERS          Intra-region IP-IP Direct Audio: yes
    Codec Set: 1          Inter-region IP-IP Direct Audio: yes
        UDP Port Min: 2048      IP Audio Hairpinning? n
        UDP Port Max: 3329
DIFFSERV/TOS PARAMETERS
    Call Control PHB Value: 46
        Audio PHB Value: 46
        Video PHB Value: 26
802.1P/Q PARAMETERS
    Call Control 802.1p Priority: 6
        Audio 802.1p Priority: 6
        Video 802.1p Priority: 5      AUDIO RESOURCE RESERVATION PARAMETERS
H.323 IP ENDPOINTS          RSVP Enabled? n
    H.323 Link Bounce Recovery? y
    Idle Traffic Interval (sec): 20
    Keep-Alive Interval (sec): 5
        Keep-Alive Count: 5
```

## 5.4. Administer IP Codec Set

Open the IP Codec Set form for the codec set specified in the IP Network Region form in **Section 5.3** by typing **change ip-codec set 1**. Enter the list of audio codec's eligible to be used in order of preference. For the interoperability test the codecs supported by Colt were configured, namely **G.729A**, **G.711A** and **G.726A-32K**.

change ip-codec-set 1 Page 1 of 2

IP CODEC SET

Codec Set: 1

Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size (ms)
1: <b>G.729A</b>	<b>n</b>	<b>2</b>	<b>20</b>
2: <b>G.711A</b>	<b>n</b>	<b>2</b>	<b>20</b>
3: <b>G.726A-32K</b>	<b>n</b>	<b>2</b>	<b>20</b>
4:			
5:			

The Colt SIP Trunk supports T.38 for transmission of fax. Navigate to **Page 2** and define T.38 fax as follows:

- Set the **FAX - Mode** to **t.38-standard**.
- Leave **ECM** at default value of **y**.

change ip-codec-set 1 Page 2 of 2

IP CODEC SET

Allow Direct-IP Multimedia? n

	Mode	Redundancy	ECM: y	Packet Size (ms)
<b>FAX</b>	<b>t.38-standard</b>	<b>0</b>		
Modem	off	0		
TDD/TTY	US	3		
H.323 Clear-channel	n	0		
SIP 64K Data	n	0		20

**Note:** **Redundancy** can be used to send multiple copies of T.38 packets which can help the successful transmission of fax over networks where packets are being dropped. This was not experienced in the test environment and **Redundancy** was left at the default value of **0**.

## 5.5. Administer SIP Signaling Groups

This signalling group (and trunk group) will be used for inbound and outbound PSTN calls to the Colt SIP Trunk. During test, this was configured to use TCP and port 5060 though it's recommended to use TLS and port 5061 in the live environment to enhance security. Configure the **Signaling Group** using the **add signaling-group x** command as follows:

- Set **Group Type** to **sip**.
- Set **Transport Method** to **tcp**.
- Set **Peer Detection Enabled** to **y** allowing Communication Manager to automatically detect if the peer server is a Session Manager.
- Set **Near-end Node Name** to the processor interface (node name **procr** as defined in the **IP Node Names** form shown in **Section 5.2**).
- Set **Far-end Node Name** to the Session Manager (node name **Session\_Manager** as defined in the **IP Node Names** form shown in **Section 5.2**).
- Set **Near-end Listen Port** and **Far-end Listen Port** to **5060** (Commonly used TCP port value).
- Set **Far-end Network Region** to the IP Network Region configured in **Section 5.3** (logically establishes the far-end for calls using this signalling group as network region 1).
- Leave **Far-end Domain** blank (allows Communication Manager to accept calls from any SIP domain on the associated trunk).
- Set **Direct IP-IP Audio Connections** to **y**.
- Leave **DTMF over IP** at default value of **rtp-payload** (Enables **RFC2833** for DTMF transmission from Communication Manager).

The default values for the other fields may be used.

add signaling-group 1		Page 1 of 2
SIGNALING GROUP		
Group Number: 1	Group Type: sip	
IMS Enabled? n	Transport Method: tcp	
Q-SIP? n

Remove '+' from Incoming Called/Calling/Alerting/Diverting/Connected Numbers? n		
Alert Incoming SIP Crisis Calls? n		
Near-end Node Name: procr	Far-end Node Name: Session_Manager	
Near-end Listen Port: 5060	Far-end Listen Port: 5060	
	Far-end Network Region: 1	
Far-end Domain:		
Incoming Dialog Loopbacks: eliminate	Bypass If IP Threshold Exceeded? n	
DTMF over IP: rtp-payload	RFC 3389 Comfort Noise? n	
Session Establishment Timer(min): 3	Direct IP-IP Audio Connections? y	
Enable Layer 3 Test? y	IP Audio Hairpinning? n	
H.323 Station Outgoing Direct Media? n	Initial IP-IP Direct Media? n	
	Alternate Route Timer(sec): 6	

## 5.6. Administer SIP Trunk Group

A trunk group is associated with the signaling group described in **Section 5.5**. Configure the trunk group using the **add trunk-group x** command, where **x** is an available trunk group. On **Page 1** of this form:

- Set the **Group Type** field to **sip**.
- Choose a descriptive **Group Name**.
- Specify a trunk access code (**TAC**) consistent with the dial plan.
- The **Direction** is set to **two-way** to allow incoming and outgoing calls.
- Set the **Service Type** field to **public-ntwrk**.
- Specify the signalling group associated with this trunk group in the **Signaling Group** field as previously configured in **Section 5.5**.
- Specify the **Number of Members** supported by this SIP trunk group.

add trunk-group 1		Page 1 of 21	
TRUNK GROUP			
Group Number: 1	Group Type: sip	CDR Reports: y	
Group Name: OUTSIDE CALL	COR: 1	TN: 1	TAC: 101
Direction: two-way	Outgoing Display? n		
Dial Access? n	Night Service:		
Queue Length: 0			
Service Type: public-ntwrk	Auth Code? n		
		Member Assignment Method: auto	
		Signaling Group: 1	
		Number of Members: 10	

On **Page 2** of the trunk-group form, the Preferred **Minimum Session Refresh Interval (sec)** field should be set to a value mutually agreed with Colt to prevent unnecessary SIP messages during call setup. During testing, a value of **600** was used that sets Min-SE to 1200 in the SIP signalling.

add trunk-group 1		Page 2 of 21	
Group Type: sip			
TRUNK PARAMETERS			
Unicode Name: auto			
		Redirect On OPTIM Failure: 5000	
SCCAN? n	Digital Loss Group: 18		
		Preferred Minimum Session Refresh Interval(sec): 600	
Disconnect Supervision - In? y Out? y			

On **Page 3**, set the **Numbering Format** field to **private**. This allows delivery of CLI in formats other than E.164 with leading “+”. In test, CLIs were sent as Communication Manager extension numbers and were reformatted by Session Manager in an Adaptation described in **Section 6.4**. This format was successfully verified in the network.

add trunk-group 1	Page 3 of 21
TRUNK FEATURES	
ACA Assignment? n	Measured: none
	Maintenance Tests? y
<b>Numbering Format: private</b>	
	UI Treatment: service-provider
	Replace Restricted Numbers? n
	Replace Unavailable Numbers? n

On **Page 4** of this form:

- Set **Support Request History** to **y**.
- Set **Send Diversion Header** to **y**. Note – History-Info and Diversion headers may not both be required but were sent during compliance testing.
- Set the **Telephone Event Payload Type** to **100** to match the value preferred by Colt (this Payload Type is not applied to calls from SIP end-points).
- Set the **Identity for Calling Party Display** to **From** to ensure that where CLI for incoming calls is withheld, it is not displayed on Communication Manager extension.

add trunk-group 1	Page 4 of 21
PROTOCOL VARIATIONS	
	Mark Users as Phone? n
Prepend '+' to Calling/Alerting/Diverting/Connected Number? n	
Send Transferring Party Information? y	
Network Call Redirection? n	
	<b>Send Diversion Header? y</b>
	<b>Support Request History? y</b>
	<b>Telephone Event Payload Type: 100</b>
	Convert 180 to 183 for Early Media? n
	Always Use re-INVITE for Display Updates? n
	Identity for Calling Party Display: From
Block Sending Calling Party Location in INVITE? n	
Accept Redirect to Blank User Destination? n	
	Enable Q-SIP? n

**Note:** - The above screenshot shows **Network Call Redirection** set to **n**. This was temporarily set to **y** for some of the last tests that involved testing of 302 Moved Temporarily and REFER messages. When set, REFER messages are sent that are not acted on by the Colt SIP Trunk and so are unnecessary additional signalling.

## 5.7. Administer Calling Party Number Information

Use the **change private-unknown-numbering** command to configure Communication Manager to send the calling party number in the format required. In test, calling party numbers were sent as Communication Manager extension numbers to be modified in Session Manager. Adaptations are used in Session Manager to format the number as described in **Section 6.4**. These calling party numbers are sent in the SIP From, Contact and PAI headers as well as the Diversion header for forwarded calls. The numbers are displayed on display-equipped PSTN telephones with any reformatting performed in the network.

change private-numbering 0					Page 1 of 2
NUMBERING - PRIVATE FORMAT					
Ext	Ext	Trk	Private	Total	
Len	Code	Grp(s)	Prefix	Len	
4	2	1		4	Total Administered: 1
					Maximum Entries: 540

## 5.8. Administer Route Selection for Outbound Calls

In the test environment, the Automatic Route Selection (ARS) feature was used to route outbound calls via the SIP trunk to the Colt SIP Trunk. The single digit **9** was used as the ARS access code providing a facility for telephone users to dial 9 to reach an outside line. Use the **change feature-access-codes** command to configure a digit as the **Auto Route Selection (ARS)** - Access Code 1.

change feature-access-codes		Page 1 of 10
FEATURE ACCESS CODE (FAC)		
Abbreviated Dialing List1 Access Code:		
Abbreviated Dialing List2 Access Code:		
Abbreviated Dialing List3 Access Code:		
Abbreviated Dial - Prgm Group List Access Code:		
Announcement Access Code: *69		
Answer Back Access Code:		
Attendant Access Code:		
Auto Alternate Routing (AAR) Access Code: 8		
Auto Route Selection (ARS) - Access Code 1: 9		Access Code 2:

Use the **change ars analysis** command to configure the routing of dialled digits following the first digit 9. A small sample of dial patterns are shown here as an example. Further administration of ARS is beyond the scope of this document. The example entries shown will match outgoing calls to numbers beginning 0. Note that exact maximum number lengths should be used where possible to reduce post-dial delay. Calls are sent to **Route Pattern 1**.

change ars analysis 0							Page 1 of 2
ARS DIGIT ANALYSIS TABLE							
Location: all							Percent Full: 0
Dialed String	Total Min	Max	Route Pattern	Call Type	Node Num	ANI Req'd	
0	11	14	1	pubu		n	
00	13	15	1	pubu		n	
118	5	6	1	pubu		n	
2	4	4	2	pubu		n	
7000	4	4	1	pubu		n	

Use the **change route-pattern x** command, where **x** is an available route pattern, to add the SIP trunk group to the route pattern that ARS selects. In this configuration, route pattern **1** is used to route calls to trunk group **1**. **Numbering Format** is applied to CLI and is used to set TDM signalling parameters such as type of number and numbering plan indicator. This doesn't have the same significance in SIP calls and during testing it was set to **unk-unk**.

change route-pattern 1														Page 1 of 3			
Pattern Number: 1														Pattern Name: Session Manager			
SCCAN? n														Secure SIP? n		Used for SIP stations? n

3:														n user			
4:														n user			
5:														n user			
6:														n user			
BCC VALUE TSC CA-TSC ITC BCIE Service/Feature PARM Sub														Numbering LAR			
0 1 2 M 4 W Request														Dgts Format			
1: Y Y Y Y Y n n rest														unk-unk none			
2: Y Y Y Y Y n n rest														none none			
3: Y Y Y Y Y n n rest														none none			
4: Y Y Y Y Y n n rest														none none			
5: Y Y Y Y Y n n rest														none none			
6: Y Y Y Y Y n n rest														none none			

## 5.9. Administer Incoming Digit Translation

This step configures the settings necessary to map incoming DDI calls to Communication Manager extensions. The incoming digits sent in the INVITE message from Colt can be manipulated as necessary to route calls to the desired extension. During test, the incoming DDI numbers were changed in Session Manager to Communication Manager extension numbers using an Adaptation as described in **Section 6.4**. When done this way, there is no requirement for any incoming digit translation in Communication Manager. If incoming digit translation is required, use the **change inc-call-handling-trmt trunk-group x** command where **x** is the Trunk Group defined in **Section 5.6**.

change inc-call-handling-trmt trunk-group 1				Page	1 of	3
INCOMING CALL HANDLING TREATMENT						
Service/	Number	Number	Del	Insert		
Feature	Len	Digits				
public-ntwrk						

**Note:** One reason for configuring the enterprise in this way is to allow the use of an extension number as a common identifier with other network elements within the enterprise such as voice mail.

## 5.10. EC500 Configuration

When EC500 is enabled on a Communication Manager station, a call to that station will generate a new outbound call from Communication Manager to the configured EC500 destination, typically a mobile phone. The following screen shows an example EC500 configuration for the user with station extension 2391. Use the command **change off-pbx-telephone station-mapping x** where **x** is Communication Manager station.

- The **Station Extension** field will automatically populate with station extension.
- For **Application** enter **EC500**.
- Enter a **Dial Prefix** (e.g., 9) if required by the routing configuration.
- For the **Phone Number** enter the phone that will also be called (e.g. **0035389434nnnn**).
- Set the **Trunk Selection** to **1** so that Trunk Group 1 will be used for routing.
- Set the **Config Set** to **1**.

change off-pbx-telephone station-mapping 2391								Page	1 of	3
STATIONS WITH OFF-PBX TELEPHONE INTEGRATION										
Station	Application	Dial	CC	Phone Number	Trunk	Config	Dual			
Extension		Prefix			Selection	Set	Mode			
2391	EC500	-		0035389434nnnn	ars	1				

**Note:** The phone number shown is for a mobile phone in the Avaya Lab. To use facilities for calls coming in from EC500 mobile phones, the number received in Communication Manager must exactly match the number specified in the above table.

Save Communication Manager configuration by entering **save translation**.

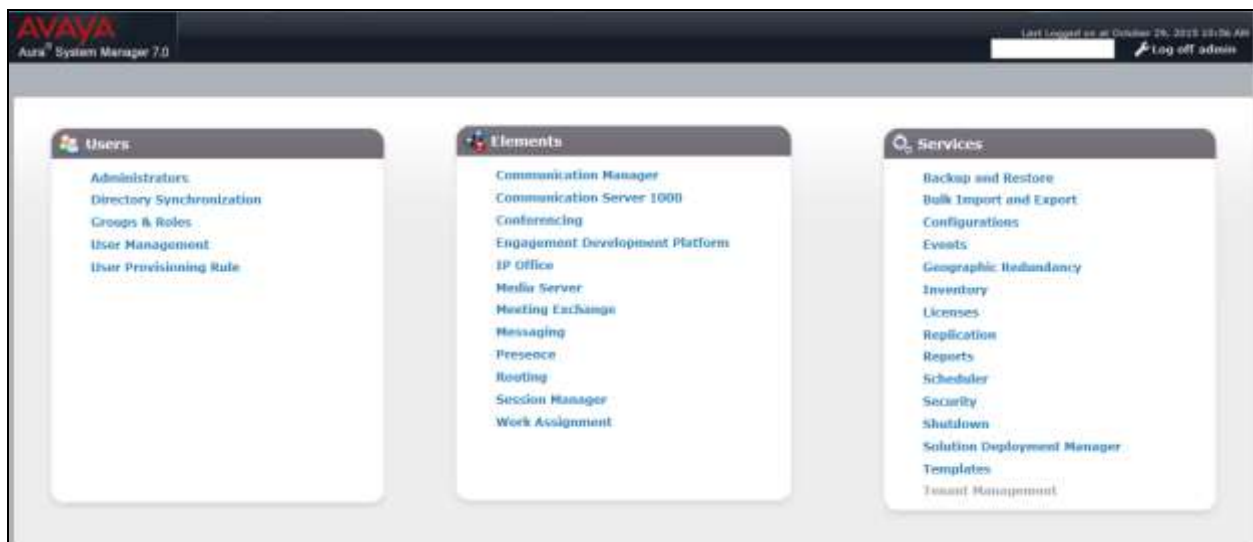

## 6. Configuring Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. Session Manager is configured by opening a web browser to the System Manager. The procedures include the following areas:

- Log in to Avaya Aura® System Manager.
- Administer SIP domain.
- Administer Locations.
- Administer Adaptations.
- Administer SIP Entities.
- Administer Entity Links.
- Administer Routing Policies.
- Administer Dial Patterns.
- Administer Application for Avaya Aura® Communication Manager.
- Administer Application Sequence for Avaya Aura® Communication Manager.
- Administer SIP Extensions.

### 6.1. Log in to Avaya Aura® System Manager

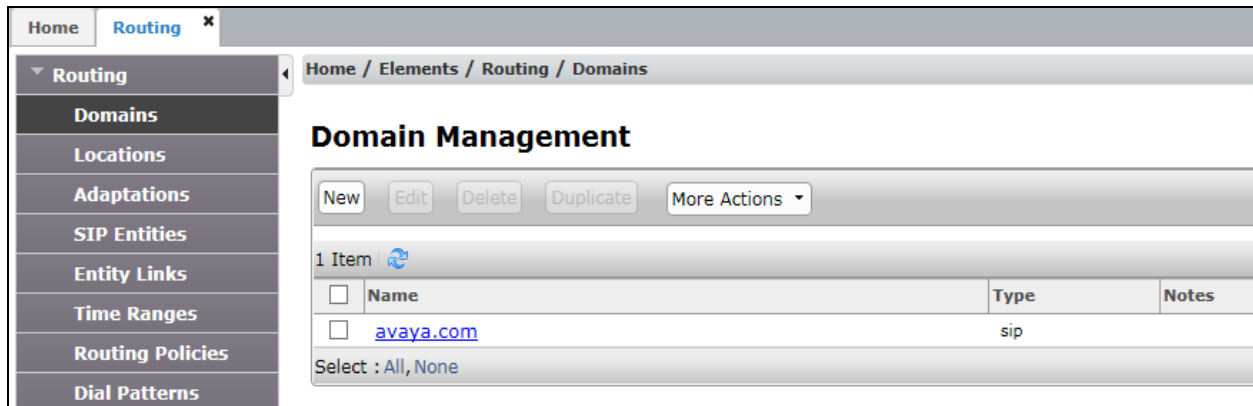

Access the System Manager using a web browser and entering **http://<FQDN>/SMGR**, where **<FQDN>** is the fully qualified domain name of System Manager. Log in using appropriate credentials (not shown) and the **Home** tab will be presented with menu options shown below.

## 6.2. Administer SIP Domain

To add the SIP domain that will be used with Session Manager, select **Routing** from the **Home** tab menu (not shown) and in the resulting tab select **Domains** from left hand menu. Click the **New** button to create a new SIP domain entry. In the **Name** field enter the domain name of the enterprise site or a name agreed with Colt; this will be the same as specified in the Authoritative Domain specified in the IP Network Region on Communication Manager. Refer to **Section 5.3** for details. In test, **avaya.com** was used. Optionally, a description for the domain can be entered in the Notes field (not shown). Click **Commit** to save changes.

The screenshot shows the 'Domain Management' interface. On the left is a navigation menu with 'Routing' expanded and 'Domains' selected. The main area has a breadcrumb 'Home / Elements / Routing / Domains' and a title 'Domain Management'. Below the title are buttons for 'New', 'Edit', 'Delete', 'Duplicate', and 'More Actions'. A table below shows one item with columns 'Name', 'Type', and 'Notes'. The item is 'avaya.com' with type 'sip'. At the bottom, it says 'Select : All, None'.

	Name	Type	Notes
<input type="checkbox"/>	avaya.com	sip	

**Note:** If the existing domain name used in the enterprise equipment does not match that used in the network, a Session Manager Adaptation can be used to change it (see **Section 6.4**).

### 6.3. Administer Locations

Locations can be used to identify logical and/or physical locations where SIP Entities reside for the purposes of bandwidth management. One location is added to the sample configuration for all of the enterprise SIP entities. On the **Routing** tab select **Locations** from the left hand menu (not shown). Under **General**, in the **Name** field, enter an informative name for the location. Scroll to the bottom of the page and under **Location Pattern**, click **Add**, then enter an **IP Address Pattern** in the resulting new row, \* is used to specify any number of allowed characters at the end of the string. Below is the location configuration used for the test enterprise.

The screenshot shows the 'Location Details' configuration page. At the top, there is a breadcrumb trail 'Home / Elements / Routing / Locations' and a 'Help ?' link. The page title is 'Location Details' with 'Commit' and 'Cancel' buttons. The 'General' section contains a 'Name' field with 'Galway' and a 'Notes' field. The 'Dial Plan Transparency in Survivable Mode' section has an 'Enabled' checkbox, a 'Listed Directory Number' field, and an 'Associated CM SIP Entity' field. The 'Overall Managed Bandwidth' section includes 'Managed Bandwidth Units' (set to 'Kbit/sec'), 'Total Bandwidth', 'Multimedia Bandwidth', and an 'Audio Calls Can Take Multimedia Bandwidth' checkbox. The 'Per-Call Bandwidth Parameters' section has fields for 'Maximum Multimedia Bandwidth (Intra-Location)', 'Maximum Multimedia Bandwidth (Inter-Location)', 'Minimum Multimedia Bandwidth', and 'Default Audio Bandwidth'. The 'Alarm Threshold' section includes 'Overall Alarm Threshold', 'Multimedia Alarm Threshold', 'Latency before Overall Alarm Trigger', and 'Latency before Multimedia Alarm Trigger'. The 'Location Pattern' section at the bottom has 'Add' and 'Remove' buttons, a table with one row containing '\*10.10.9.x' under 'IP Address Pattern', and a 'Select : All, None' option.

## 6.4. Administer Adaptations

Calls from Colt are received at the enterprise in E.164 format with leading “+” on the Request URI. An Adaptation specific to Communication Manager is used to convert the called party number to a pre-defined extension number before onward routing to the Communication Manager SIP Entity and removes the requirement for incoming digit manipulation on Communication Manager.

On the **Routing** tab select **Adaptations** from the left-hand menu. Click on **New** (not shown).

- In the **Adaptation name** field, enter a descriptive title for the adaptation.
- In the **Module name** drop down menu, select **DigitConversionAdapter**. This is used for simple digit conversion adaptations.
- In the **Module parameter Type** drop down menu, select **Single Parameter**.
- In the Module Parameter box, type **fromto=true**. This will apply the adaptation to the From and To headers as well as the Request URI.

The screenshot shows a web interface for configuring adaptations. At the top is a breadcrumb trail: 'Home / Elements / Routing / Adaptations'. Below this is the title 'Adaptation Details' and two buttons, 'Commit' and 'Cancel'. The 'General' section contains the following fields:

- \* Adaptation Name:** A text input field containing 'E.164\_to\_Extn'.
- \* Module Name:** A dropdown menu with 'DigitConversionAdapter' selected.
- Module Parameter Type:** A dropdown menu with an empty selection.
- Egress URI Parameters:** A text input field.
- Notes:** A text input field.

Scroll down and in the section **Digit Conversion for Outgoing Calls from SM**, click on **Add**. An additional row will appear (not shown). This allows information to be entered for the manipulation of numbers coming from the network. This is where the called party number is translated from E.164 format to the extension number for termination of calls on Communication Manager. In addition, the calling party number is adapted to diallable format for display on Communication Manager extensions.

The screenshot below shows a translation for each called party number. This is not normally necessary where the extension number forms part of the national number. When this is the case, a simple deletion of the leading digits is required.

- Under **Matching Pattern** enter the DDI number as received from the network.
- Under **Min** and **Max** enter the Minimum and Maximum digits of the incoming DDI number.
- Under **Delete Digits** enter the number of digits to delete to leave only the extension number remaining, during test all had to be deleted as the extension number did not form part of the national number.
- Under **Insert Digits** enter digits to be inserted. During test, this was the full extension number. If the extension number forms part of the DDI number, there will be no entry required here.
- Under **Address to Modify** choose **destination** from the drop down box to apply this rule to the To and Request-Line headers only.

	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes
<input type="checkbox"/>	*+	*12	*15		*1	00	origination		
<input type="checkbox"/>	*+44	*12	*13		*3	0	origination		
<input type="checkbox"/>	*+445511nnnn00	*13	*13		*13	2000	destination		
<input type="checkbox"/>	*+445511nnnn01	*13	*13		*13	2391	destination		
<input type="checkbox"/>	*+445511nnnn02	*13	*13		*13	2291	destination		
<input type="checkbox"/>	*+445511nnnn03	*13	*13		*13	2396	destination		
<input type="checkbox"/>	*+445511nnnn04	*13	*13		*13	2400	destination		
<input type="checkbox"/>	*+445511nnnn05	*13	*13		*13	7000	destination		
<input type="checkbox"/>	*+445511nnnn06	*13	*13		*13	6099	destination		
<input type="checkbox"/>	*+445511nnnn07	*13	*13		*13	6002	destination		

**Note:** In the above screenshots the DDI numbers are partially obscured. If the number is to be changed to diallable format for display on Communication Manager extensions, additional rows will be required. These would replace the leading “+” with “00” for international calling party numbers and “+44” would be replaced by “0” for national calling party numbers.

An additional Adaptation is required to convert extension numbers to E.164 format. Calls from Communication Manager are received at the Session Manager with the extension number in the From header. An Adaptation specific to Colt is used to convert the calling party number to E.164 format with leading “+” before onward routing to the Colt SIP Trunk.

On the **Routing** tab select **Adaptations** from the left-hand menu. Click on **New** (not shown).

- In the **Adaptation name** field, enter a descriptive title for the adaptation.
- In the **Module name** drop down menu, select **DigitConversionAdapter**. This is used for simple digit conversion adaptations.
- In the **Module parameter Type** drop down menu, select **Single Parameter**.
- In the Module Parameter box, type **fromto=true**. This will apply the adaptation to the From and To headers as well as the Request URI.

fromto	true

Select: All, None

Egress URI Parameters:

Notes:

**Note:** When the Adaptation is viewed, **Module Parameter Type** appears as **Name-Value Parameter** and a box appears showing the parameters entered. For this adaptation, only **fromto** with a value of **true** is shown.

Scroll down and in the section **Digit Conversion for Outgoing Calls from SM**, click on **Add**. An additional row will appear (not shown). This allows information to be entered for the manipulation of numbers coming from Communication Manager. This is where the calling party number is translated from the extension number to E.164 format for display on the terminating PSTN phones as the diallable DDI number assigned to the extension. In addition, the called party number is adapted to E.164 format with leading “+” for both national and international numbers.

The screenshot below shows a translation for each calling party number. This is not normally necessary where the extension number forms part of the national number. When this is the case, a simple additional of the leading digits to build up the E.164 format is required.

- Under **Matching Pattern** enter the extension number as received from Communication Manager.
- Under **Min** and **Max** enter the Minimum and Maximum digits of the incoming DDI number.
- Under **Delete Digits** enter the number of digits to delete to remove any digits that will not form part of the E.164 number, during test all had to be deleted as the extension number did not form part of the national number.
- Under **Insert Digits** enter digits to be inserted. During test, this was the full E.164 number with leading “+”. If the extension number forms part of the DDI number, only the necessary prefix digits will be required.
- Under **Address to Modify** choose **origination** from the drop down box to apply this rule to the From header only.

	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes
<input type="checkbox"/>	*0	*10	*12		*1	+44	destination		
<input type="checkbox"/>	*00	*10	*17		*2	+	destination

<input type="checkbox"/>	*2396	*4	*4		*4	+44207nnnnn51	origination		
<input type="checkbox"/>	*2400	*4	*4		*4	+44207nnnnn53	origination		

Select : All, None

Commit Cancel

**Note:** In the above screenshots the DDI numbers are partially obscured. In addition, the international dialling prefix of “00” is replaced by “+” for international called party numbers and “0” is replaced by “+44” for national called party numbers.

## 6.5. Administer SIP Entities

A SIP Entity must be added for each SIP-based telephony system supported by a SIP connection to Session Manager. To add a SIP Entity, select **SIP Entities** on the left panel menu, and then click on the **New** button (not shown). The following will need to be entered for each SIP Entity.

Under **General**:

- In the **Name** field enter an informative name.
- In the **FQDN or IP Address** field enter the IP address of the Session Manager or the signalling interface on the connecting system.
- In the **Type** field use **Session Manager** for a Session Manager SIP entity, **CM** for a Communication Manager SIP entity and **SIP Trunk** for the Avaya SBCE SIP entity.
- In the **Adaptation** field (not available for the Session Manager SIP Entity), select the appropriate Adaptation from the drop down menu.
- In the **Location** field select the appropriate location from the drop down menu.
- In the **Time Zone** field enter the time zone for the SIP Entity.

In this configuration there are three SIP Entities:

- Avaya Aura® Session Manager SIP Entity.
- Avaya Aura® Communication Manager SIP Entity.
- Avaya Session Border Controller for Enterprise (Avaya SBCE) SIP Entity.

### 6.5.1. Avaya Aura® Session Manager SIP Entity

The following screens show the SIP entity for Session Manager. The **FQDN or IP Address** field is set to the IP address of the Session Manager SIP signalling interface.

The screenshot shows the 'SIP Entity Details' configuration page. At the top, there is a breadcrumb trail: 'Home / Elements / Routing / SIP Entities'. Below this, the title 'SIP Entity Details' is displayed on the left, and 'Commit' and 'Cancel' buttons are on the right. The 'General' tab is selected. The form contains the following fields:

- Name:** Session\_Manager
- \* FQDN or IP Address:** 10.10.9.31
- Type:** Session Manager (dropdown menu)
- Notes:** (empty text field)
- Location:** Galway (dropdown menu)
- Outbound Proxy:** (empty dropdown menu)
- Time Zone:** Europe/Dublin (dropdown menu)
- Credential name:** (empty text field)

Below the 'General' section, there is a 'SIP Link Monitoring' section with a dropdown menu set to 'Use Session Manager Configuration'.

Session Manager must be configured with the port numbers on the protocols that will be used by the other SIP entities. To configure these scroll to the bottom of the page and under **Port**, click **Add**, then edit the fields in the resulting new row.

- In the **Port** field enter the port number on which the system listens for SIP requests.
- In the **Protocol** field enter the transport protocol to be used for SIP requests.
- In the **Default Domain** field, from the drop down menu select the domain added in **Section 6.2** as the default domain.

**Listen Ports**

## 6.6. Administer Entity Links

A SIP trunk between a Session Manager and another system is described by an Entity Link. To add an Entity Link, select **Entity Links** on the left panel menu and click on the **New** button (not shown). Fill in the following fields in the new row that is displayed.

- In the **Name** field enter an informative name.
- In the **SIP Entity 1** field select **Session Manager**.
- In the **Port** field enter the port number to which the other system sends its SIP requests.
- In the **SIP Entity 2** field enter the other SIP Entity for this link, created in **Section 6.5**.
- In the **Port** field enter the port number to which the other system expects to receive SIP requests.
- Select the **Trusted** tick box to make the other system trusted.
- In the **Protocol** field enter the transport protocol to be used to send SIP requests.

Click **Commit** to save changes. The following screen shows the Entity Links used in this configuration.

The screenshot shows a web interface for managing Entity Links. At the top, there is a breadcrumb trail: Home / Elements / Routing / Entity Links. Below this is a title bar 'Entity Links' with a 'Help' icon. A toolbar contains buttons for 'New', 'Edit', 'Delete', 'Duplicate', and a 'More Actions' dropdown. Below the toolbar, it says '3 Items' and 'Filter: Enable'. The main content is a table with the following columns: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, DNS Override, Port, Connection Policy, Deny New Service, and Notes. The table contains three rows: ASBCE\_Link, CM\_Entity\_Link, and Messaging\_Link. Each row has a checkbox in the Name column and a checkbox in the Deny New Service column. The SIP Entity 1 for all rows is 'Session\_Manager'. The Protocol for all rows is 'TCP'. The Port for all rows is '5060'. The SIP Entity 2 values are 'ASBCE', 'CM\_Entity', and 'Messaging'. The DNS Override for all rows is an unchecked checkbox. The Connection Policy for all rows is 'trusted'. The Deny New Service for all rows is an unchecked checkbox. At the bottom left, it says 'Select : All, None'.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	DNS Override	Port	Connection Policy	Deny New Service	Notes
<input type="checkbox"/> ASBCE_Link	Session_Manager	TCP	5060	ASBCE	<input type="checkbox"/>	5060	trusted	<input type="checkbox"/>	
<input type="checkbox"/> CM_Entity_Link	Session_Manager	TCP	5060	CM_Entity	<input type="checkbox"/>	5060	trusted	<input type="checkbox"/>	
<input type="checkbox"/> Messaging_Link	Session_Manager	TCP	5060	Messaging	<input type="checkbox"/>	5060	trusted	<input type="checkbox"/>	

**Note:** The **Messaging\_Link** Entity Link is used for the Avaya Aura® Messaging system and is not described in this document.

## 6.7. Administer Routing Policies

Routing policies must be created to direct how calls will be routed to a system. To add a routing policy, select **Routing Policies** on the left panel menu and then click on the **New** button (not shown).

Under **General**:

- Enter an informative name in the **Name** field.
- Under **SIP Entity as Destination**, click **Select**, and then select the appropriate SIP entity to which this routing policy applies.
- Under **Time of Day**, click **Add**, and then select the time range.

The following screen shows the routing policy for Communication Manager.

The screenshot shows the 'Routing Policy Details' window for 'CM\_Terminating'. The 'General' tab is active, showing fields for Name, Disabled, Retries, and Notes. The 'SIP Entity as Destination' section contains a table with one entry: CM\_Entity, 10.10.9.12, CM. The 'Time of Day' section shows a table with one entry: 0, 24/7, 00:00, 23:59, Time Range 24/7.

## 6.8. Administer Dial Patterns

A dial pattern must be defined to direct calls to the appropriate telephony system. To configure a dial pattern select **Dial Patterns** on the left panel menu and then click on the **New** button (not shown).

Under **General**:

- In the **Pattern** field enter a dialled number or prefix to be matched.
- In the **Min** field enter the minimum length of the dialled number.
- In the **Max** field enter the maximum length of the dialled number.
- In the **SIP Domain** field select **ALL** or alternatively one of those configured in **Section 6.2**.

Under **Originating Locations and Routing Policies**:

- Click **Add**, in the resulting screen (not shown).
- Under **Originating Location**, select the location defined in **Section 6.3** or **ALL**.
- Under **Routing Policies** select one of the routing policies defined in **Section 6.7**.
- Click **Select** button to save.

The following screen shows an example dial pattern configured for the Avaya SBCE which will route the calls out to the PSTN via the Colt SIP Trunk.

## 6.9. Administer Application for Avaya Aura® Communication Manager

From the **Home** tab select **Session Manager** from the menu. In the resulting tab from the left panel menu select **Application Configuration** → **Applications** and click **New** (not shown).

- In the **Name** field enter a name for the application.
- In the **SIP Entity** field select the SIP entity for Communication Manager.
- In the **CM System for SIP Entity** field select the SIP entity for Communication Manager and select **Commit** to save the configuration.

**Application Editor** [Commit] [Cancel]

**Application**

\* Name: CM\_App

\* SIP Entity: CM\_Entity

Description:

## 6.10. Administer Application Sequence for Avaya Aura® Communication Manager

From the left panel navigate to **Session Manager** → **Application Configuration** → **Application Sequences** and click on **New** (not shown).

- In the **Name** field enter a descriptive name.
- Under **Available Applications**, click the + sign in front of the appropriate application instance. When the screen refreshes the application should be displayed under the **Applications in this Sequence** heading. Select **Commit**.

The screenshot shows the 'Application Sequence Editor' window. At the top, there is a breadcrumb trail: 'Home / Elements / Session Manager / Application Configuration / Application Sequences'. Below this, the title 'Application Sequence Editor' is displayed with 'Commit' and 'Cancel' buttons. The main form has two sections: 'Application Sequence' and 'Applications in this Sequence'. In the 'Application Sequence' section, the 'Name' field is populated with 'CM\_App\_Seq' and the 'Description' field is empty. The 'Applications in this Sequence' section contains a table with one item, 'CM\_App', which is marked as mandatory. Below this table is a 'Select' dropdown menu set to 'All'. At the bottom, the 'Available Applications' section shows a table with one item, 'CM\_App', which can be added to the sequence by clicking a plus sign.

Sequence Order (first to last)	Name	SIP Entity	Mandatory	Description
<input type="checkbox"/>	CM_App	CM_Entity	<input checked="" type="checkbox"/>	

Name	SIP Entity	Description
CM_App	CM_Entity	

## 6.11. Administer SIP Extensions

SIP extensions are registered with Session Manager and use Communication Manager for their feature and configuration settings. From the **Home** tab select **User Management** from the menu. Then select **Manage Users** and click **New** (not shown).

On the **Identity** tab:

- Enter the user's name in the **Last Name** and **First Name** fields.
- In the **Login Name** field enter a unique system login name in the form of user@domain e.g. **2291@avaya.com** which is used to create the user's primary handle.
- The **Authentication Type** should be **Basic**.
- In the **Password/Confirm Password** fields enter an alphanumeric password.
- Set the **Language Preference** and **Time Zone** as required.

The screenshot shows the 'New User Profile' form in the User Management interface. The form is divided into tabs: Identity, Communication Profile, Membership, and Contacts. The Identity tab is active, showing fields for User Provisioning Rule, Last Name, First Name, Login Name, Authentication Type, Password, Confirm Password, Localized Display Name, Endpoint Display Name, Title, Language Preference, Time Zone, Employee ID, Department, and Company. The form is pre-filled with example data: Last Name: SIP, First Name: 9608, Login Name: 2291@avaya.com, Authentication Type: Basic, Password: 9608, Confirm Password: 9608, Language Preference: English (United Kingdom), Time Zone: (0:0)GMT : Dublin, Edinburgh, L.

On the **Communication Profile** tab, enter a numeric **Communication Profile Password** and confirm it.

The screenshot shows the 'Communication Profile' tab in a configuration interface. At the top, there are tabs for 'Identity', 'Communication Profile', 'Membership', and 'Contacts'. The 'Communication Profile' section contains two password fields: 'Communication Profile Password' and 'Confirm Password', both masked with dots. Below these is a 'Name' section with a 'New' button, a 'Delete' button, a 'Done' button, and a 'Cancel' button. The 'Name' field is set to 'Primary', and the 'Default' checkbox is checked. Below the 'Name' section is a 'Communication Address' section with a 'New' button, an 'Edit' button, and a 'Delete' button. The 'Communication Address' section contains a table with columns 'Type', 'Handle', and 'Domain'. The table is currently empty, showing 'No Records found'.

Expand the **Communication Address** section and click **New**. For the **Type** field select **Avaya SIP** from the drop-down menu. In the **Fully Qualified Address** field, enter an extension number and select the relevant domain from the drop-down menu. Click the **Add** button.

The screenshot shows the 'Communication Address' section expanded. It contains a 'New' button, an 'Edit' button, and a 'Delete' button. Below these is a table with columns 'Type', 'Handle', and 'Domain'. The table is currently empty, showing 'No Records found'. Below the table, the 'Type' field is set to 'Avaya SIP'. The 'Fully Qualified Address' field is set to '2291' and the 'Domain' field is set to 'avaya.com'. The 'Add' button is visible at the bottom right.

Expand the **Session Manager Profile** section.

- Make sure the **Session Manager Profile** check box is checked.
- Select the appropriate Session Manager instance from the drop-down menu in the **Primary Session Manager** field.
- Select the appropriate application sequence from the drop-down menu in the **Origination Sequence** field configured in **Section 6.10**.
- Select the appropriate application sequence from the drop-down menu in the **Termination Sequence** field configured in **Section 6.10**.
- Select the appropriate location from the drop-down menu in the **Home Location** field.

## 7. Configure Avaya Session Border Controller for Enterprise

This section describes the configuration of the Avaya Session Border Controller for Enterprise (Avaya SBCE). The Avaya SBCE provides security and manipulation of signalling to provide an interface to the Service Provider's SIP Trunk that is standard where possible and adapted to the Service Provider's SIP implementation where necessary.

### 7.1. Access Avaya Session Border Controller for Enterprise

Access the Session Border Controller using a web browser by entering the URL **https://<ip-address>**, where **<ip-address>** is the private IP address configured at installation. A log in screen is presented. Log in using username ucsec and the appropriate password.

The login screen features the Avaya logo in red on the left. To the right, under the heading "Log In", is a "Username:" label followed by a text input field and a "Continue" button. Below the input field, there are two paragraphs of legal disclaimer text and a copyright notice at the bottom: "© 2011 - 2015 Avaya Inc. All rights reserved."

**AVAYA**

**Session Border Controller for Enterprise**

**Log In**

Anyone accessing this system expressly consents to such monitoring and recording, and is advised that if it reveals possible evidence of criminal activity, the evidence of such activity may be provided to law enforcement officials.

All users must comply with all corporate instructions regarding the protection of information assets.

© 2011 - 2015 Avaya Inc. All rights reserved.

Once logged in, a dashboard is presented with a menu on the left-hand side. The menu is used as a starting point for all configuration of the Avaya SBCE.

The dashboard has a top navigation bar with links: Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header shows "Session Border Controller for Enterprise" and the Avaya logo. On the left is a sidebar menu with "Dashboard" selected, and sub-items: Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies, TLS Management, and Device Specific Settings. The main content area is divided into two panels. The left panel, titled "Information", contains a table with system details. The right panel, titled "Installed Devices", shows a list of devices.

## 7.2. Define Network Management

Network information is required on the Avaya SBCE to allocate IP addresses and masks to the interfaces. Note that only the **A1** and **B1** interfaces are used, typically the **A1** interface is used for the internal side and **B1** is used for external. Each side of the Avaya SBCE can have only one interface assigned.

To define the network information, navigate to **Device Specific Settings → Network Management** in the main menu on the left hand side and click on **Add**.

Enter details for the external interface in the dialogue box (not shown):

- Enter a descriptive name in the **Name** field.
- Enter the default gateway IP address for the external interface in the **Default Gateway** field.
- Enter the subnet mask in the **Subnet Mask** field.
- Select the external interface to be used from the **Interface** drop down menu. In the test environment, this was **B1**.
- Click on **Add** and an additional row will appear allowing an IP address to be entered.
- Enter the external IP address in the IP Address field and leave the Public IP and Gateway Override fields blank.
- Click on **Finish** to complete the interface definition.

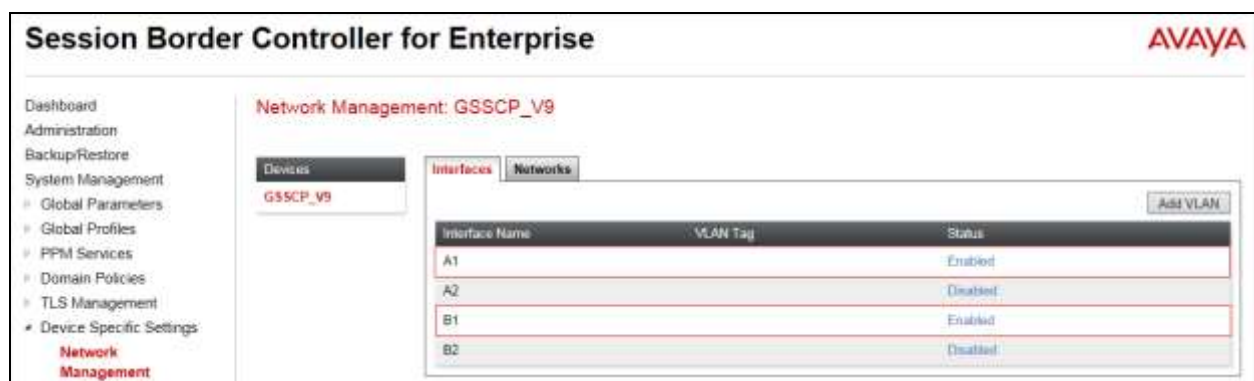

Click on **Add** to define the internal interface. Enter details in the dialogue box (not shown):

- Enter a descriptive name in the **Name** field.
- Enter the default gateway IP address for the internal interface in the **Default Gateway** field.
- Enter the subnet mask in the **Subnet Mask** field.
- Select the internal interface to be used from the **Interface** drop down menu. In the test environment, this was **A1**.
- Click on **Add** and an additional row will appear allowing an IP address to be entered.
- Enter the internal IP address in the IP Address field and leave the Public IP and Gateway Override fields blank.
- Click on **Finish** to complete the interface definition.

The following screenshot shows the completed Network Management configuration:

Select the **Interface Configuration** tab and click on **Toggle State** to enable the interfaces.

**Note:** to ensure that the Avaya SBCE uses the interfaces defined, the Application must be restarted.

- Click on **System Management** in the main menu (not shown).
- Select **Restart Application** indicated by an icon in the status bar (not shown).

## 7.3. Define Interfaces

When the IP addresses and masks are assigned to the interfaces, these are then configured as signalling and media interfaces. Testing was carried out with TCP used for transport of signalling between the Session Manager and the Avaya SBCE, and UDP for transport of signalling between the Avaya SBCE and the Colt SIP Trunk. This document shows the configuration for TCP and UDP, if additional security is required, it's recommended to use TLS and port 5061.

### 7.3.1. Signalling Interfaces

To define the signalling interfaces on the Avaya SBCE, navigate to **Device Specific Settings** → **Signaling Interface** (not shown) in the main menu on the left hand side. Details of transport protocol and ports for the external and internal SIP signalling are entered here.

- Select **Add** and enter details of the external signalling interface in the pop-up menu.
- In the **Name** field enter a descriptive name for the external signalling interface.
- In the **IP Address** drop down menus, select the external network interface and IP address. Note that when the external network interface is selected, the bottom drop down menu is populated with the available IP addresses as defined in **Section 7.2**. In the test environment, this was a single IP address **192.168.122.57**.
- Enter the UDP port number in the **UDP Port** field, **5060** is used for the Colt SIP Trunk.

The screenshot displays the 'Session Border Controller for Enterprise' web interface. On the left is a navigation menu with options like Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies, TLS Management, and Device Specific Settings. Under 'Device Specific Settings', 'Signaling Interface' is highlighted. The main area shows the 'Add Signaling Interface' dialog box. The 'Name' field is set to 'External'. The 'IP Address' dropdown is set to 'External (B1, VLAN 0)', and the 'IP Address' dropdown below it is set to '192.168.122.57'. The 'TCP Port' field is empty with the text 'Leave blank to disable'. The 'UDP Port' field is set to '5060' with the text 'Leave blank to disable'. The 'TLS Port' field is empty with the text 'Leave blank to disable'. The 'TLS Profile' dropdown is set to 'None'. There is an 'Enable Shared Control' checkbox which is unchecked, and a 'Shared Control Port' field which is empty. A 'Finish' button is at the bottom right of the dialog box.

The internal signalling interface is defined in the same way; the dialogue box is not shown:

- Select **Add** and enter details of the internal signalling interface in the pop-up menu.
- In the **Name** field enter a descriptive name for the internal signalling interface.
- In the **IP Address** drop down menus, select the internal network interface and IP address.
- Select **TCP** port number, **5060** is used for Session Manager.

The following screenshot shows details of the signalling interfaces:

Signaling Interface: GSSCP\_V9

Devices

GSSCP\_V9

Signaling Interface

Modifying or deleting an existing signaling interface will require an application restart before taking effect. Application restarts can be issued from System Management.

Add

Name	Signaling IP Network	TCP Port	UDP Port	TLS Port	TLS Profile	
Internal	10.10.9.71 Internal (A1, VLAN 0)	5060	---	---	None	Edit Delete
External	192.168.122.57 External (B1, VLAN 0)	---	5060	---	None	Edit Delete

**Note:** In the test environment, the internal IP address was **10.10.9.71**.

### 7.3.2. Media Interfaces

To define the media interfaces on the Avaya SBCE, navigate to **Device Specific Settings** → **Media Interface** in the main menu on the left hand side. Details of the RTP and SRTP port ranges for the internal and external media streams are entered here. The IP addresses for media can be the same as those used for signalling.

- Select **Add** and enter details of the external media interface in the pop-up menu.
- In the **Name** field enter a descriptive name for the external media interface.
- In the **IP Address** drop down menus, select the external network interface and IP address. Note that when the external network interface is selected, the bottom drop down menu is populated with the available IP addresses as defined in **Section 7.2**. In the test environment, this was a single IP address **192.168.122.57**.
- Define the **RTP Port Range** for the media path with the Colt SIP Trunk, during testing this was left at the default values.

## 7.4. Define Server Interworking

Server interworking is defined for each server connected to the Avaya SBCE. In this case, the Colt SIP Trunk is connected as the Trunk Server and Session Manager is connected as the Call Server.

To define server interworking on the Avaya SBCE, navigate to **Global Profiles → Server Interworking** in the main menu on the left hand side. To define Server Interworking for Session Manager, click on **Add** (not shown). A pop-up menu (not shown) is generated. In the **Name** field enter a descriptive name for Session Manager and click **Next**.

**Editing Profile: ASM**

**General**

Hold Support: ☒ None ☐ RFC2543 - c=0.0.0.0 ☐ RFC3264 - a=sendonly

Delayed SDP Handling: ☐

Re-Invite Handling: ☐

Prack Handling: ☐

Allow 18X SDP: ☐

T.38 Support: ☒

URI Scheme: ☒ SIP ☐ TEL ☐ ANY

Via Header Format: ☒ RFC3261 ☐ RFC2543

**Finish**

Configuration of interworking includes Hold support, T.38 fax support and SIP extensions.

- In the General dialogue box shown in the previous screenshot, check the **T.38 Support** box. During testing, the rest of the parameters were left at default values.
- Click on **Next** and **Next** again to go through the next two dialogue boxes. During testing, these were left at default values.

The image shows two side-by-side screenshots of the 'Interworking Profile' configuration dialog. The left screenshot displays the 'SIP Timers' section with the following fields and values: Min-SE (1 seconds, [90 - 86400]), Init Timer (50 milliseconds, [50 - 1000]), Max Timer (200 milliseconds, [200 - 8000]), Transc Expire (1 seconds, [1 - 64]), and Invite Expire (180 seconds, [180 - 300]). The right screenshot displays the 'Privacy' section with 'Privacy Enabled' (unchecked), 'User Name' (empty), 'P-Asserted-Identity' (unchecked), 'P-Preferred-Identity' (unchecked), and 'Privacy Header' (empty). Both screenshots have 'Back' and 'Next' buttons at the bottom.

In the final dialogue box, select the required extensions from the **Extensions** drop down menu. Note that Avaya extensions are not supported for the SIP Trunk though they were applied to Session Manager during testing. Click on **Finish**.

The image shows the 'Editing Profile: ASM' dialog. It contains the following sections and options:

- Record Routes:** Radio buttons for None, Single Side, Both Sides (selected), Dialog-Initiate Only (Single Side), and Dialog-Initiate Only (Both Sides).
- Include End Point IP for Context Lookup:** Unchecked checkbox.
- Extensions:** Drop-down menu showing 'Avaya' (highlighted with a red box).
- Diversion Manipulation:** Unchecked checkbox.
- Diversion Condition:** Drop-down menu showing 'None'.
- Diversion Header URI:** Empty text field.
- Has Remote SBC:** Checked checkbox.
- Route Response on Via Port:** Unchecked checkbox.
- DTMF:** Radio buttons for None (selected), SIP NOTIFY, and SIP INFO.
- Finish:** Button at the bottom.

To define Server Interworking for the Colt SIP Trunk, click on **Add** (not shown). A pop-up menu (not shown) is generated. In the **Name** field enter a descriptive name for the Colt SIP Trunk and click **Next**.

In the General dialogue box that appears, check the **T.38** box

General	
Hold Support	<input checked="" type="radio"/> None <input type="radio"/> RFC2543 - c=0.0.0.0 <input type="radio"/> RFC3264 - a=sendonly

<div>Finish</div>	

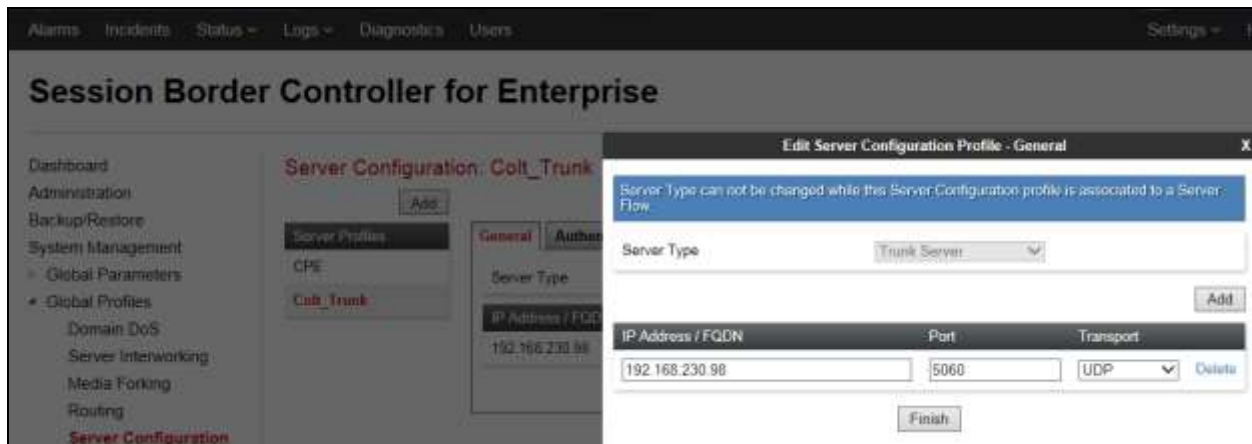

- Click on **Next** and **Next** again to go through the next two dialogue boxes. During testing, these were left at default values.

In the final dialogue box, select **None** from the **Extensions** box and click on **Finish**.

## 7.5. Define Servers

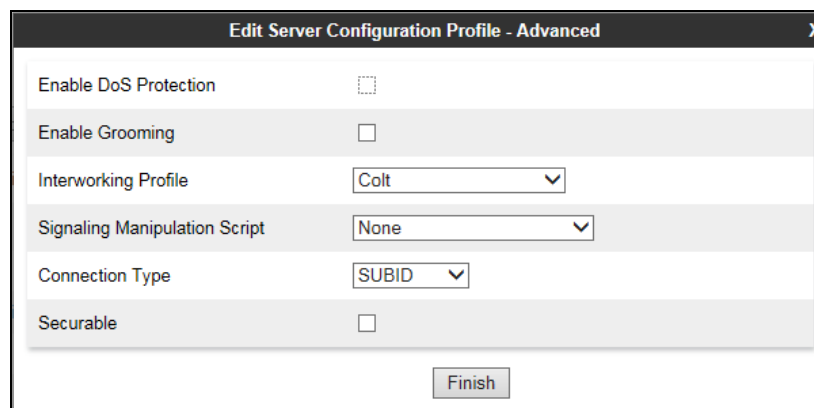

A server definition is required for each server connected to the Avaya SBCE. In this case, the Colt SIP Trunk is connected as the Trunk Server and Session Manager is connected as the Call Server. To define the Colt SIP Trunk Server, navigate to **Global Profiles → Server Configuration** in the main menu on the left hand side. Click on **Add** and enter an appropriate name in the pop-up menu (not shown). Click on **Next** and enter details in the dialogue box.

- In the **Server Type** drop down menu, select **Trunk Server**.
- Click on **Add** to enter an IP address.
- In the **IP Addresses / FQDN** box, type the Colt network SBC interface address.
- In the **Port** box, enter the port to be used for the SIP Trunk. This was left blank during testing which defaults to 5060 when UDP is used for transport.
- In the **Transport** drop down menu, select **UDP**.
- Click on **Next**.

Click on **Next** and **Next** again to go through the next two dialogue boxes. During testing, these were left at default values. Final dialogue box is the **Advanced** settings.

- In the **Interworking Profile** drop down menu, select the **Interworking Profile** for the Colt SIP Trunk defined in **Section 7.4**.
- Click **Finish**.

Use the process above to define the Call Server configuration for Session Manager if not already defined.

- Ensure that **Call Server** is selected in the **Server Type** drop down menu in the **General** dialogue box.
- Ensure that the Interworking Profile defined for Session Manager in **Section 7.4** is selected in the **Interworking Profile** drop down menu in the **Advanced** dialogue box (not shown).

**Edit Server Configuration Profile - General** X

Server Type can not be changed while this Server Configuration profile is associated to a Server Flow.

Server Type: Call Server ▼

Add

IP Address / FQDN	Port	Transport	
10.10.9.31	5060	TCP ▼	Delete

Finish

## 7.6. Define Routing

Routing information is required for routing to the Colt SIP Trunk on the external side and the Session Manager on the internal side. The IP addresses and ports defined here will be used as the destination addresses for signalling.

To define routing to Session manager, navigate to **Global Profiles → Routing** in the main menu on the left hand side. Click on **Add** and enter an appropriate name in the dialogue box (not shown), click on Next and enter details for the Routing Profile:

- Click on **Add** to specify an IP address for Session Manager.
- Assign a priority in the **Priority / Weight** field, with a single IP address a value of **1** can be used.
- Select the Server Configuration defined in **Section 7.5** in the **Server Configuration** drop down menu. This automatically populates the **Next Hop Address** field.
- Click **Finish**.

The screenshot shows the 'Session Border Controller for LAN - Edit Rule' configuration window. The left sidebar contains a menu with 'Routing Profiles: LAN' selected. The main area shows the 'Edit Rule' form for a LAN profile. The form includes fields for 'URI Group' (set to '\*'), 'Time of Day' (set to 'default'), 'Load Balancing' (set to 'Priority'), 'NAPTR' (checkbox), 'Transport' (set to 'None'), 'Next Hop Priority' (checkbox, checked), 'Next Hop In-Dialog' (checkbox), and 'Ignore Route Header' (checkbox). Below these fields is a table with columns: 'Priority / Weight', 'Server Configuration', 'Next Hop Address', and 'Transport'. The table contains one row with values: '1', 'CPE', '10.10.9.31:5060 (TCP)', and 'None'. There are 'Add', 'Finish', and 'Delete' buttons.

Repeat the above process for the Routing Profile for the Colt SIP Trunk.

The screenshot shows the 'Session Border Controller for WAN - Edit Rule' configuration window. The left sidebar contains a menu with 'Routing Profiles: WAN' selected. The main area shows the 'Edit Rule' form for a WAN profile. The form includes fields for 'URI Group' (set to '\*'), 'Time of Day' (set to 'default'), 'Load Balancing' (set to 'Priority'), 'NAPTR' (checkbox), 'Transport' (set to 'None'), 'Next Hop Priority' (checkbox, checked), 'Next Hop In-Dialog' (checkbox), and 'Ignore Route Header' (checkbox). Below these fields is a table with columns: 'Priority / Weight', 'Server Configuration', 'Next Hop Address', and 'Transport'. The table contains one row with values: '1', 'Colt\_Trunk', '192.168.230.98:5060 (UDP)', and 'None'. There are 'Add', 'Finish', and 'Delete' buttons.

## 7.7. Topology Hiding

Topology hiding is used to hide local information such as private IP addresses and local domain names. The local information can be overwritten with a domain name or IP address. The default **Replace Action** is **Auto**, this replaces local information with IP addresses, generally the next hop or external interfaces. Topology hiding has the advantage of presenting single Via and Record-Route headers externally where multiple headers may be received from the enterprise, particularly from Session Manager. In some cases where Topology Hiding can't be applied, in particular the Contact header, IP addresses are translated to the Avaya SBCE external addresses using NAT.

To define Topology Hiding for the Colt SIP Trunk, navigate to **Global Profiles → Topology Hiding** in the main menu on the left hand side. Click on **Add** and enter details in the **Topology Hiding Profile** pop-up menu (not shown).

- In the **Profile Name** field enter a descriptive name for the Colt SIP Trunk and click **Next**.
- Click on **Add Header** and select from the **Header** drop down menu.
- Select **IP** or **IP/Domain** from the **Criteria** drop down menu depending on requirements. During testing **IP** was used for the From header so that the domain name of “anonymous.invalid” for CLI restricted calls was not overwritten.
- Leave the **Replace Action** at the default value of **Auto** unless a specific domain name is required. In this case, select **Overwrite** and define a domain name in the **Overwrite Value** field.
- Topology hiding was defined for all headers where the function is available.

**Topology Hiding Profiles: Colt**

Click here to add a description

Header	Criteria	Replace Action	Overwrite Value
Refer-To	IP/Domain	Auto	—
Via	IP/Domain	Auto	—
To	IP/Domain	Auto	—
From	IP	Auto	—
Record-Route	IP/Domain	Auto	—
Refered-By	IP	Auto	—
SDP	IP	Auto	—
Request-Line	IP/Domain	Auto	—

To define Topology hiding for Session Manager, follow the same process. This can be simplified by cloning the profile defined for the Colt SIP Trunk. Do this by highlighting the profile defined for Session Manager and clicking on **Clone**.

Enter an appropriate name for Session Manager and click on Next (not shown). Make any changes where required, in the test environment the settings were left at the same values.

**Topology Hiding Profiles: ASM**

Referred-By	IP	Auto	---
SDP	IP	Auto	---
Request-Line	IP/Domain	Auto	---

Edit

## 7.8. End Point Policy Groups

End Point Policy Groups are used to bring together a number of different rules for use in a server flow described in **Section 7.9**. The Colt SIP Trunk was tested with a signalling rule to remove unnecessary and Avaya proprietary SIP headers. This was not necessary for the effective functioning of the SIP Trunk but was used to reduce the SIP message size.

### 7.8.1. Signalling Rules

Signalling rules are a mechanism on the Avaya SBCE to handle any non-standard signalling that may be encountered on the SIP Trunk of a particular Service Provider. In the case of the Colt SIP Trunk, this was the transmission of Avaya proprietary and unnecessary SIP message headers from the Avaya equipment.

To define the signalling rule, navigate to **Domain Policies** → **Signaling Rules** in the main menu on the left hand side. Click on **Add** and enter details in the Signaling Rule pop-up box. In the **Rule Name** field enter a descriptive name for the signalling rule and click **Next** and **Next** again, then **Finish**.

- Click on the **Request Headers** tab and then click on **Add In Header Control** (not shown).
- Either select a standard header from the **Header Name** drop down menu or check the **Proprietary Request Header** box and enter the name manually. The example shows **P-Location**.
- Select **ALL** from the **Method Name** drop down menu.
- Check the **Forbidden** button in the **Header Criteria** menu.
- Select **Remove Header** from the **Presence Action** drop down menu.

Apply the above to the following SIP Headers: Accept; Alert-Info; Av-Global-Session-ID; Endpoint-View; P-AV-Message-Id; P-Charging-Vector; P-Location: The following screenshot shows the applied Request Header removal:

Row	Header Name	Method Name	Header Criteria	Action	Proprietary	Direction	
1	Accept	ALL	Forbidden	Remove Header	No	IN	Edit Delete
2	Alert-Info	ALL	Forbidden	Remove Header	No	IN	Edit Delete
3	Av-Global-Session-ID	ALL	Forbidden	Remove Header	Yes	IN	Edit Delete
4	Endpoint-View	ALL	Forbidden	Remove Header	Yes	IN	Edit Delete
5	P-AV-Message-Id	ALL	Forbidden	Remove Header	Yes	IN	Edit Delete
6	P-Charging-Vector	ALL	Forbidden	Remove Header	Yes	IN	Edit Delete
7	P-Location	ALL	Forbidden	Remove Header	Yes	IN	Edit Delete

The same is required for Response Headers. In addition to applying the rule to the headers listed previously, the rule must also be applied to the response codes where the headers may be present. The screenshot below shows the applied Response Header removal:

**Signaling Rules: Header\_Removal**

Add Filter By Device: [v] Rename Clone Delete

Click here to add a description

Row	Header Name	Response Code	Method Name	Header Criteria	Action	Proprietary	Direction	Edit	Delete
1	Accept-Language	1XX	ALL	Forbidden	Remove Header	No	IN	Edit	Delete
2	Accept-Language	2XX	ALL	Forbidden	Remove Header	No	IN	Edit	Delete
3	Alert-Info	1XX	ALL	Forbidden	Remove Header	No	IN	Edit	Delete
4	Alert-Info	2XX	ALL	Forbidden	Remove Header	No	IN	Edit	Delete
5	Av-Global-Session-ID	1XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
6	Av-Global-Session-ID	2XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
7	Endpoint-View	1XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
8	Endpoint-View	2XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
9	P-AV-Message-Id	1XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
10	P-AV-Message-Id	2XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
11	P-Charging-Vector	1XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
12	P-Charging-Vector	2XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
13	P-Location	1XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete
14	P-Location	2XX	ALL	Forbidden	Remove Header	Yes	IN	Edit	Delete

Response headers are defined in the same way as request headers. The screenshot over the page shows the additional drop down menu for **Response Code**. This is applied to **1XX** and **2XX** response codes so the header can be removed from 180 Ringing / 183 Session Progress and 200 OK messages.

SIP header “P-Location” is shown as an example. Click **Finish** to complete.

## 7.8.2. End Point Policy Group

An End Point Policy Group is required to implement the signalling rule. To define one for use in the Session Manager server flow, navigate to **Domain Policies** → **End Point Policy Groups** in the main menu on the left hand side. Click on **Add** and enter an appropriate name in the pop-up box (not shown). Click on **Next** to configure the Policy Set. Enter details as follows:

- Leave the **Application Rule**, **Border Rule**, **Media Rule** and **Security Rule** at their default values.
- Select the **Signaling Rule** created in the previous section in the drop down menu.
- Click on **Finish**.

## 7.9. Server Flows

Server Flows combine the previously defined profiles into two End Point Server Flows, one for the Colt SIP Trunk and another for Session Manager. These End Point Server Flows allow calls to be routed from the Session Manager to the Colt SIP Trunk and vice versa. To define a Server Flow for the Colt SIP Trunk, navigate to **Device Specific Settings → End Point Flows**.

- Click on the **Server Flows** tab.
- Select **Add Flow** and enter details in the pop-up menu.
- In the **Name** field enter a descriptive name for the server flow for the Colt SIP Trunk, in the test environment **Colt\_Trunk** was used.
- In the **Received Interface** drop-down menu, select the internal SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for the Colt SIP Trunk is received on.
- In the **Signaling Interface** drop-down menu, select the external SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for the Colt SIP Trunk is sent on.
- In the **Media Interface** drop-down menu, select the external media interface defined in **Section 7.3**. This is the interface that media bound for the Colt SIP Trunk is sent on.
- In the **Routing Profile** drop-down menu, select the routing profile of the Session Manager defined in **Section 7.6**.
- In the **Topology Hiding Profile** drop-down menu, select the topology hiding profile of the Colt SIP Trunk defined in **Section 7.7** and click **Finish**.

The screenshot shows a dialog box titled "Edit Flow: Colt\_Trunk" with a close button (X) in the top right corner. The dialog contains the following fields and values:

Field	Value
Flow Name	Colt_Trunk
Server Configuration	Colt_Trunk
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	Internal
Signaling Interface	External
Media Interface	External
End Point Policy Group	default-low
Routing Profile	LAN
Topology Hiding Profile	Colt
Signaling Manipulation Script	None
Remote Branch Office	Any

At the bottom right of the dialog is a "Finish" button.

To define a Server Flow for Session Manager, navigate to **Device Specific Settings → End Point Flows**.

- Click on the **Server Flows** tab.
- Select **Add Flow** and enter details in the pop-up menu.
- In the **Name** field enter a descriptive name for the server flow for Session Manager, in the test environment **CPE** was used.
- In the **Received Interface** drop-down menu, select the external SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for Session Manager is received on.
- In the **Signaling Interface** drop-down menu, select the internal SIP signalling interface defined in **Section 7.3**. This is the interface that signalling bound for Session Manager is sent on.
- In the **Media Interface** drop-down menu, select the internal media interface defined in **Section 7.3**. This is the interface that media bound for Session Manager is sent on.
- In the **End Point Policy Group** drop-down menu, select the End Pint Policy Group defined in **Section 7.8**.
- In the **Routing Profile** drop-down menu, select the routing profile of the Colt SIP Trunk defined in **Section 7.6**.
- In the **Topology Hiding Profile** drop-down menu, select the topology hiding profile of Session Manager defined in **Section 7.7** and click **Finish**.

The screenshot shows a dialog box titled "Edit Flow: CPE" with a close button (X) in the top right corner. The dialog contains the following fields and values:

Field	Value
Flow Name	CPE
Server Configuration	CPE
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	External
Signaling Interface	Internal
Media Interface	Internal
End Point Policy Group	SM-def-low
Routing Profile	WAN
Topology Hiding Profile	ASM
Signaling Manipulation Script	None
Remote Branch Office	Any

At the bottom center of the dialog is a button labeled "Finish".

The information for all Server Flows is shown on a single screen on the Avaya SBCE.

## 8. Configure the Colt SIP Trunk Equipment

The configuration of the Colt equipment used to support the SIP Trunk is outside the scope of these Application Notes and will not be covered. To obtain further information on Colt equipment and system configuration please contact an authorised Colt representative, see **Section 2.3** for information on contacting Colt.

## 9. Verification Steps

This section provides steps that may be performed to verify that the solution is configured correctly.

1. From System Manager **Home** tab click on **Session Manager** and navigate to **Session Manager → System Status → SIP Entity Monitoring**. Select the relevant SIP Entities from the list and observe if the **Conn Status** and **Link Status** are showing as **up**.

The screenshot shows the 'Session Manager Entity Link Connection Status' page. It includes a sidebar with navigation options like Session Manager, Administration, Communication, Profile Editor, Network, Configuration, Device and Location, Application, Configuration, and System Status. The main content area displays a table of entity links. The table has columns for SIP Entity Name, SIP Entity Resolved IP, Port, Proto, Desc, Conn. Status, Reason Code, and Link Status. Three entities are listed: CM\_Entity, ASBCE, and Messaging, all with a Link Status of 'UP'.

SIP Entity Name	SIP Entity Resolved IP	Port	Proto	Desc	Conn. Status	Reason Code	Link Status
CM_Entity	10.10.9.12	5060	TCP	FALSE	UP	200 OK	UP
ASBCE	10.10.9.71	5060	TCP	FALSE	UP	200 OK	UP
Messaging	10.10.2.82	5060	TCP	FALSE	UP	200 OK	UP

2. From Communication Manager SAT interface run the command **status trunk n** where **n** is a previously configured SIP trunk. Observe if all channels on the trunk group display **in-service/idle**.

```
status trunk 1
```

TRUNK GROUP STATUS			
Member	Port	Service State	Mtce Connected Ports Busy
0001/001	T00001	in-service/idle	no
0001/002	T00002	in-service/idle	no
0001/003	T00003	in-service/idle	no
0001/004	T00004	in-service/idle	no
0001/005	T00005	in-service/idle	no
0001/006	T00006	in-service/idle	no
0001/007	T00007	in-service/idle	no
0001/008	T00008	in-service/idle	no
0001/009	T00009	in-service/idle	no

3. Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active.
4. Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active.
5. Verify that the user on the PSTN can end an active call by hanging up.
6. Verify that an endpoint at the enterprise site can end an active call by hanging up.
7. Should issues arise with the SIP trunk, use the Avaya SBCE trace facility to check that the OPTIONS requests sent from Session Manager via the Avaya SBCE to the network SBCs are receiving a response.

To define the trace, navigate to **Device Specific Settings → Advanced Options → Troubleshooting → Trace** in the main menu on the left hand side and select the **Packet Capture** tab.

- Select the SIP Trunk interface from the **Interface** drop down menu.
- Select the signalling interface IP address or **All** from the **Local Address** drop down menu.
- Enter the IP address of the network SBC in the **Remote Address** field or enter a \* to capture all traffic.
- Specify the **Maximum Number of Packets to Capture**, 10000 is shown as an example.
- Specify the filename of the resultant pcap file in the **Capture Filename** field.
- Click on **Start Capture**.

The screenshot displays the 'Packet Capture Configuration' window in the Avaya SBCE management interface. The left-hand navigation pane is expanded to 'Trace' under 'Advanced Options'. The main window title is 'Trace: GSSCP\_V9'. Below the title bar, there are tabs for 'Devices' and 'Captures', with 'Captures' being the active tab. The configuration form includes the following fields and values:

- Status:** Ready
- Interface:** B1 (selected from a dropdown)
- Local Address (IP Port):** All (selected from a dropdown)
- Remote Address:** \* (entered in the text field)
- Protocol:** All (selected from a dropdown)
- Maximum Number of Packets to Capture:** 10000 (entered in the text field)
- Capture Filename:** OPTIONS\_1.pcap (entered in the text field)

At the bottom of the configuration form, there are two buttons: 'Start Capture' and 'Clear'.

To view the trace, select the **Captures** tab and click on the relevant filename in the list of traces.

Trace: GSSCP\_V9

Devices

GSSCP\_V9

Packet Capture

Captures

Refresh

File Name	File Size (bytes)	Last Modified	
OPTIONS_1_20151029061908.pcap	20,480	October 29, 2015 6:21:56 AM GMT	Delete

The trace is viewed as a standard pcap file in Wireshark. If the SIP trunk is working correctly, a SIP response to OPTIONS in the form of a 200 OK will be seen from the Colt network.

## 10. Conclusion

These Application Notes describe the configuration necessary to connect Avaya Aura® Communication Manager R7.0, Avaya Aura® Session Manager 7.0 and Avaya Session Border Controller for Enterprise R7.0 to the Colt SIP Trunk. The Colt SIP Trunk is a SIP-based Voice over IP solution providing businesses a flexible, cost-saving alternative to traditional hardwired telephony trunks. The service was successfully tested with a number of observations listed in **Section 2.2**.
