

Avaya Solution & Interoperability Test Lab

Application Notes for Avaya IP Office Release 8.0 with AT&T Business in a Box® (BIB) over IP Flexible Reach Service – Issue 1.0

Abstract

These Application Notes describe the steps for configuring Avaya IP Office with the AT&T Business in a Box® over IP Flexible Reach service. AT&T Business in a Box® over IP Flexible Reach service only supports **MIS/PNT** transport connection.

The AT&T Business in a Box® over IP Flexible Reach service is one of several SIP-based Voice over IP (VoIP) services offered to enterprises for a variety of voice communications needs. The AT&T IP Flexible Reach service allows enterprises in the U.S.A. to place outbound local and long distance calls, receive inbound Direct Inward Dialing (DID) calls from the PSTN, and place calls between an enterprise's sites.

AT&T is a member of the Avaya DevConnect Service Provider program. Information in these Application Notes has been obtained through compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program.

1. Introduction

These Application Notes describe the steps for configuring Avaya IP Office R8 with the AT&T Business in a Box® (BIB) over IP Flexible Reach service.

In the sample configuration, the Avaya IP Office solution consists of an Avaya IP Office 500 v2 Release 8.0, Avaya Embedded Voicemail in IP Office Mode, Avaya IP Office Softphone (SIP), and Avaya H.323, SIP, and Analog endpoints.

The AT&T Business in a Box® over IP Flexible Reach service is one of several SIP-based Voice over IP (VoIP) services offered to enterprises for a variety of voice communications needs via MIS/PNT transport connections. The AT&T Business in a Box® over IP Flexible Reach service allows enterprises in the U.S.A. to place outbound local and long distance calls, receive inbound Direct Inward Dialing (DID) calls from the PSTN, and place calls between an enterprise's sites.

2. General Test Approach and Results

The test environment (see **Figure 1**) consisted of:

- A simulated enterprise with IP Office, Avaya phones and fax machines (Ventafax application).
- A laboratory version of the AT&T Business in a Box® over IP Flex Reach service, to which the simulated enterprise was connected via MIS/PNT transport.

The main test objectives were to verify the features and functionality described in **Section 2.1**.

Testing was successful. Any limitations related to the overall configuration are noted in **Section 2.2**.

2.1. Interoperability Compliance Testing

The interoperability compliance testing focused on verifying inbound and outbound call flows (see **Section 3.2** for examples) between IP Office and the AT&T Business in a Box® over IP Flexible Reach service. This compliance testing was based on a test plan provided by AT&T, for the functionality required for certification as a solution supported on the AT&T network. Calls were made to and from the PSTN across the AT&T network. The following features were tested as part of this effort:

- Inbound and Outbound SIP Trunking calls between AT&T Business in a Box® over IP Flex Reach service and IP Office endpoints.
- Call and two-way talk path establishment between PSTN and IP Office phones via the AT&T Business in a Box® over Flex Reach service.
- Basic supplementary telephony features such as hold, resume, transfer, and conference.
- G.729 and G.711 codecs.
- Inbound and Outbound T.38 fax calls between AT&T Business in a Box® over IP Flex Reach service/PSTN and Avaya IP Office G3 and SG3 fax endpoints, with Error Correction Mode (ECM).
- DTMF tone transmission using RFC 2833 between IP Office and the AT&T Business in a Box® over IP Flex Reach service/PSTN automated access systems.

- Inbound AT&T IP Flex Reach service calls to IP Office that are directly routed to stations, and unanswered, can be covered to IP Office embedded Voicemail.
- Call redirection with Diversion Header.
- Long duration calls.

In addition, some IP Office Mobility features were tested (Mobile Call Back and Mobile Call Control).

2.2. Known Limitations

Interoperability testing of the sample configuration was completed with successful results, however the following observations were noted:

1. G.711 Fax is not supported in the reference configuration. The IP Office feature **T.38 Fallback** (to G.711) is also not supported in the reference configuration.
2. IP Office only supports a packet size of 20 msec (with no PTIME value specified). Although no issues were found during testing, the AT&T IP Flexible Reach service recommends a value of 30ms.
3. An issue was found with IP Office calls attempting to use the G.729B codec. As a result, the G.729B codec (Silence Suppression, see **Sections 5.4.3** and **5.5.2**) is not supported at this time and instead G.729A can be used. An IP Office product defect was filed.
4. A no audio condition was found in the AT&T test network environment when an inbound PSTN call was forwarded back to PSTN or twinned to a mobile phone. This problem was apparently a result of media deadlock condition where the security aspects of the AT&T test network environment expected IP Office endpoint to send RTP packets first, even though there was no IP Office originated media involved (since the original inbound PSTN call had been re-directed to a second PSTN destination). A work around for this issue was accomplished by enabling RTP Keepalives in IP Office to send spurious RTP packets toward the AT&T test network at the start of the call, thus breaking the media deadlock. Although this issue may not occur in production AT&T Business in a Box® over IP Flexible Reach service connections, customers experiencing loss of audio for similar call flows over secure connections should follow the steps for enabling RTP Keepalives in IP Office as shown in **Section 5.3.3**.
5. Emergency 911/E911 Services Limitations and Restrictions - Although AT&T provides 911/E911 calling capabilities, AT&T does not warrant or represent that the equipment and software (e.g., IP PBX) reviewed in this customer configuration guide will properly operate with AT&T IP Flexible Reach to complete 911/E911 calls; therefore, it is Customer's responsibility to ensure proper operation with its equipment/software vendor.

While AT&T IP Flexible Reach services support E911/911 calling capabilities under certain Calling Plans, there are circumstances when that E911/911 service may not be available, as stated in the Service Guide for AT&T IP Flexible Reach found at <http://new.serviceguide.att.com><<http://new.serviceguide.att.com/>>. Such circumstances

include, but are not limited to, relocation of the end user's CPE, use of a non-native or virtual telephone number, failure in the broadband connection, loss of electrical power, and delays that may occur in updating the Customer's location in the automatic location information database. Please review the AT&T IP Flexible Reach Service Guide in detail to understand the limitations and restrictions.

* NOTE: N11 (including 911) calls are not supported unless AT&T IP Flexible Reach Local Service is ordered.

2.3. Support

2.3.1. Avaya

For technical support on the Avaya products described in these Application Notes visit <http://support.avaya.com>.

2.3.2. AT&T

AT&T customers may obtain support for the AT&T Business in a Box® over IP Flexible Reach service by calling (877) 288-8362 or by visiting:

<http://www.business.att.com/enterprise/Service/voice-services/voip/business-in-a-box/>

3. Reference Configuration

The reference configuration used in these Application Notes is shown in **Figure 1** below and consists of the following components:

- IP Office provides the voice communications services for a particular enterprise site. In the reference configuration, IP Office runs on an IP 500 V2. This solution is extensible to other Avaya IP Office hardware too.
- Avaya “desk” telephones are represented with an Avaya 1608 H.323 set, an Avaya 6211 Analog set, an Avaya 1120E SIP set, and PC based IP Office Softphone (SIP). Fax endpoints are represented by PCs running Ventafax software connected by modem to an IP Office analog port.
- IP Office embedded voicemail (IP Office Mode) provided the voice messaging capabilities in the reference configuration.
- Outbound and Inbound calls utilize telephone or fax User/Extensions provisioned on IP Office. Signaling is sent between IP Office and the AT&T Business in a Box® over IP Flexible Reach Border Element.
- The AT&T IP Flexible Reach service requires the following network settings between IP Office and the IP Flexible Reach Border Element:
 - UDP transport using port 5060
 - RTP port ranges 16384-32767
- AT&T provided the inbound and outbound access numbers (DID and DNIS) used in the reference configuration.

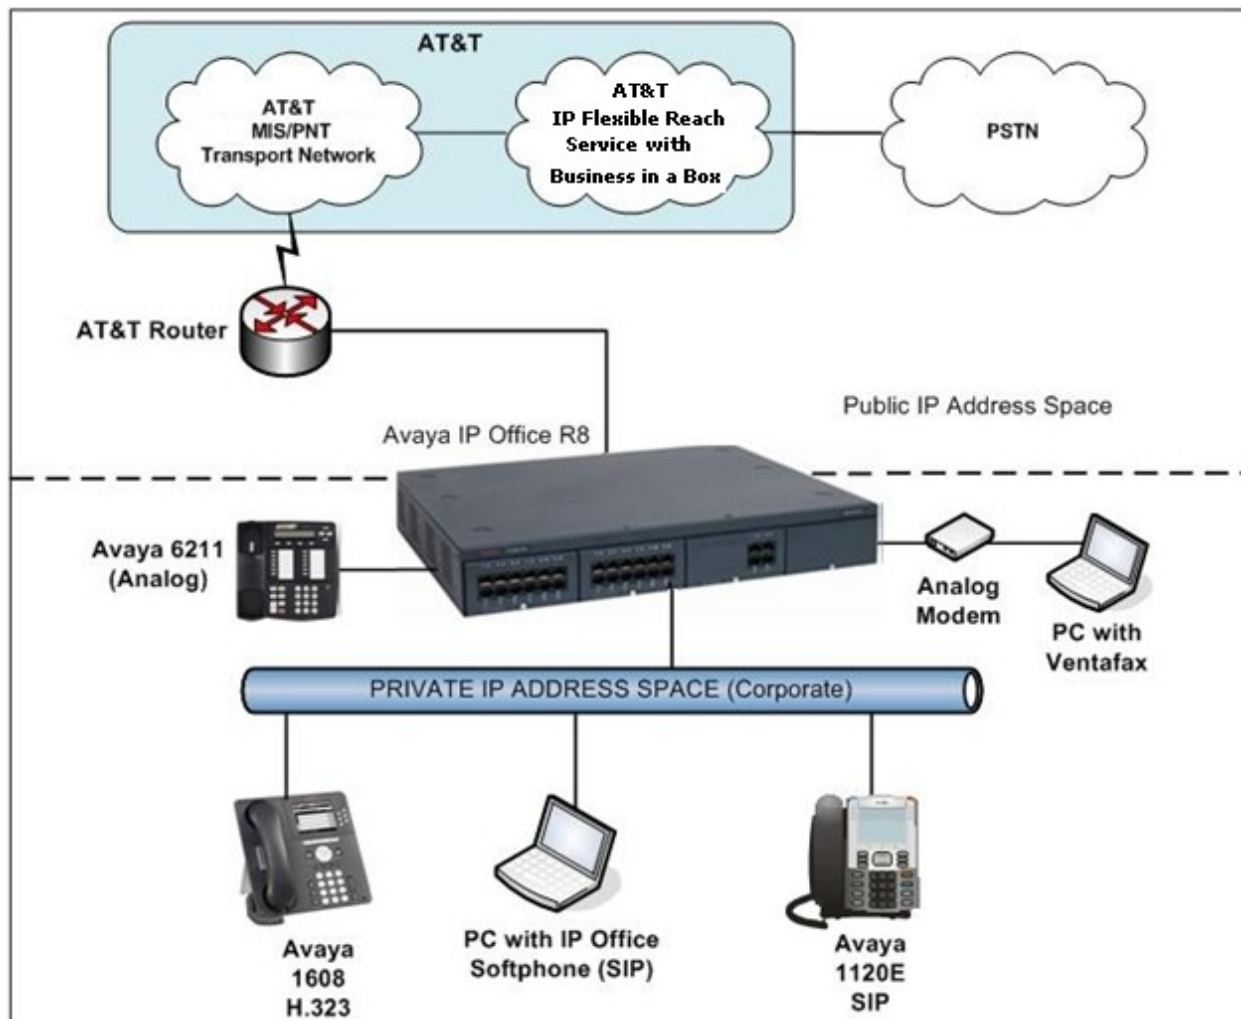

Figure 1: Reference Configuration

3.1. Illustrative Configuration Information

The specific values listed in **Table 1** below and in subsequent sections are used in the reference configuration described in these Application Notes, and are for illustrative purposes only. Customers must obtain and use the specific values for their own specific configurations.

Note - The AT&T Business in a Box® over IP Flexible Reach IP addressing shown in this document is an example. AT&T Customer Care will provide the actual IP addressing as part of the Business in a Box® over IP Flexible Reach provisioning process.

Component	Illustrative Value in these Application Notes
Avaya IP Office 500 V2	
Public IP Address (LAN2 interface, labeled “WAN” on the chassis, see Section 5.1)	192.168.64.130
Private IP Address (LAN1 interface, labeled “LAN” on the chassis, see Section 5.1)	192.168.42.1
Avaya IP Office Extensions	207 – 6211 Analog set 500 - 1608 H.323 set 600 – 1120E SIP set 700 – IP Office Softphone (SIP)
AT&T Business in a Box® over IP Flexible Reach Service	
Border Element IP Address	135.25.29.74
AT&T Access router interface	192.168.64.254

Table 1: Illustrative Values Used in these Application Notes

3.2. Call Flows

To understand how inbound and outbound AT&T Business in a Box® over IP Flexible Reach service calls are handled by IP Office, four basic call flows are described in this section.

3.2.1. Inbound

The first call scenario illustrated in the figure below is an inbound AT&T Business in a Box® over IP Flexible Reach service call that arrives on IP Office, which in turn routes the call to a hunt group, phone or a fax endpoint.

1. A PSTN phone originates a call to an AT&T Business in a Box® over IP Flexible Reach service number.
2. The PSTN routes the call to the AT&T Business in a Box® over IP Flexible Reach service network.
3. The AT&T Business in a Box® over IP Flexible Reach service routes the call to IP Office.
4. IP Office applies any necessary digit manipulations based upon the DID and routes the call to a hunt group, phone or a fax endpoint.

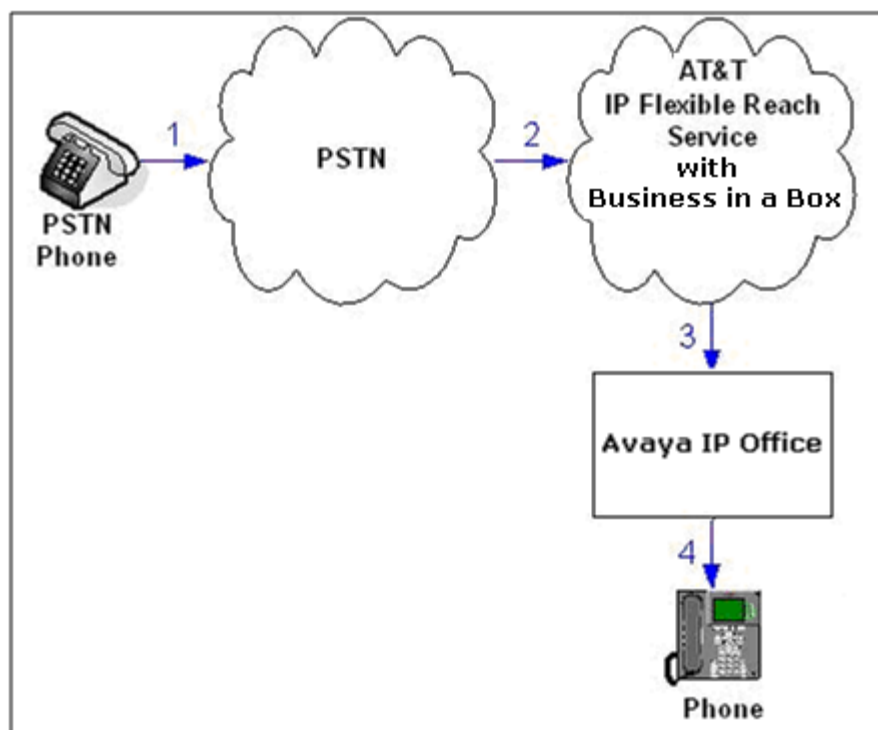

Figure 1: Inbound AT&T Business in a Box® over IP Flexible Reach Call

3.2.2. Outbound

The second call scenario illustrated in the figure below is an outbound call initiated on IP Office for delivery to AT&T Business in a Box® over IP Flexible Reach service.

1. An IP Office phone or fax endpoint originates a call via the AT&T Business in a Box® over IP Flexible Reach service for delivery to PSTN.
2. IP Office applies any necessary origination treatment (verifying permissions, determining the proper route, selecting the outgoing trunk, etc.) and routes the call to AT&T Business in a Box® over IP Flexible Reach service.
3. The AT&T Business in a Box® over IP Flexible Reach service delivers the call to PSTN.
4. PSTN delivers the call to a phone or fax endpoint.

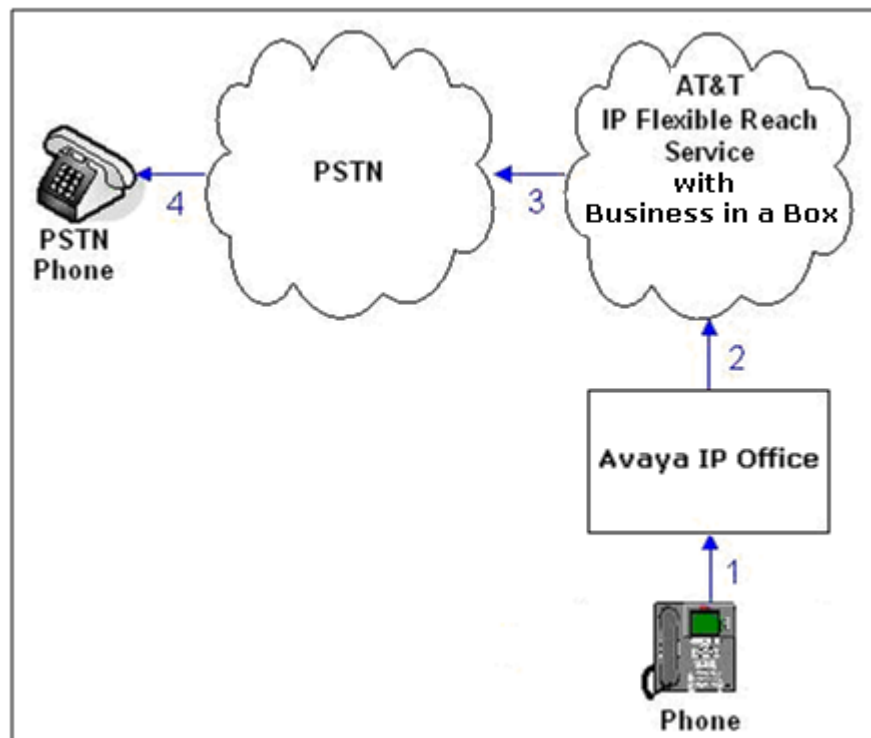

Figure 2: Outbound AT&T IP Business in a Box® over Flexible Reach Call

3.2.3. Call Forward Re-direction¹

The third call scenario illustrated in the figure below is an inbound AT&T Business in a Box® over IP Flexible Reach service call destined for an IP Office station that has set Call Forwarding to an alternate destination. Without answering the call, IP Office immediately redirects the call back to the AT&T Business in a Box® over IP Flexible Reach service for routing to the alternate destination. **Note** –AT&T requires the Diversion header when a call is redirected to AT&T Business in a Box® over IP Flexible Reach service telephone number. (See **Section 5.4**).

1. Same as the first call scenario in **Section 3.2.1**.
2. Because the IP Office phone has set Call Forward to another AT&T Business in a Box® over IP Flexible Reach service number, IP Office initiates a new call back out to the AT&T Business in a Box® over P Flexible Reach service network.

¹ Note that when the redirection is completed, RTP will still flow through IP Office

3. The AT&T Business in a Box® over IP Flexible Reach service places a call to the alternate destination and upon answer, IP Office connects the calling party (PSTN Phone) to the target party (Target Phone).

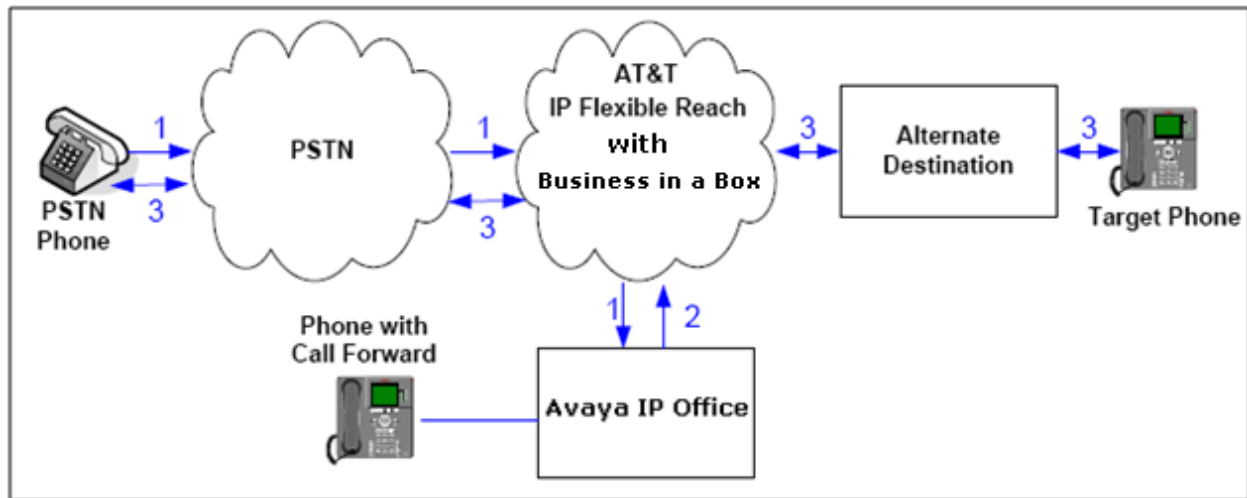

Figure 3: Re-directed (e.g. Call Forward) AT&T Business in a Box® over IP Flexible Reach Call

3.2.4. Coverage to Voicemail

The call scenario illustrated in the figure below is an inbound call that is covered to voicemail. In this scenario, the voicemail system is IP Office embedded voice mail.

1. Same as the first call scenario in **Section 3.2.1**.
2. The IP Office phone does not answer the call, and the call covers to the embedded IP Office Voicemail.

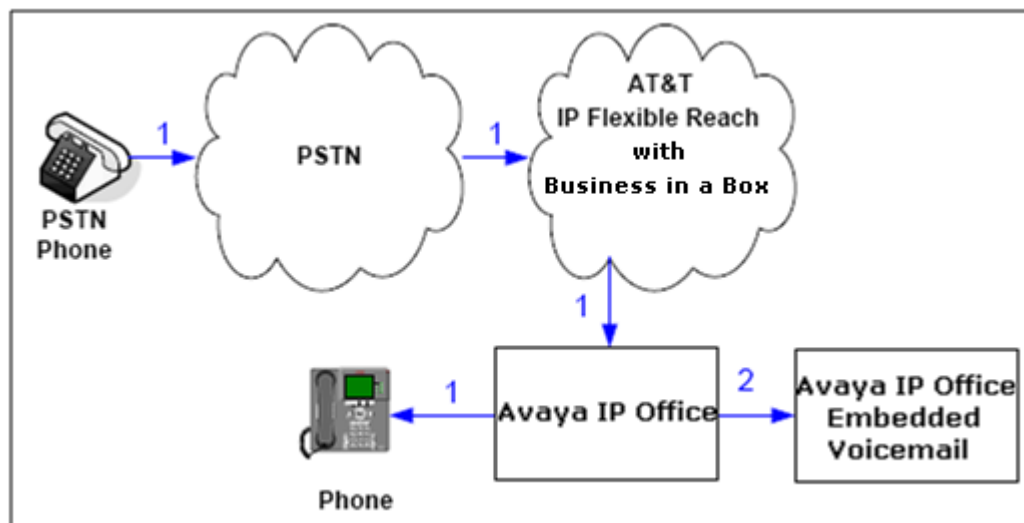

Figure 4: Coverage to Voicemail

4. Equipment and Software Validated

The following equipment and software was used for the reference configuration described in these Application Notes.

Component	Version
Avaya IP Office 500 V2	R8 (16)
Avaya IP Office Manager	10.0 (16)
Avaya 1608 (H.323) Telephone	Ha1608ua1_300B.bin
Avaya 1120E (SIP) Telephone	04.03.09.00
Avaya IP Office Softphone (SIP)	3.2.3.15
Avaya 6211 Analog Telephone	-
Fax device	Ventafax 6.3
AT&T Business in a Box® over IP Flexible Reach Service via MIS/PNT transport service connections.	VNI 21

Table 2: Equipment and Software Versions

5. Avaya IP Office Configuration

Note - This section describes attributes of the reference configuration, but is not meant to be prescriptive. The configuration steps described here are only for the fields where a value was changed. For all the other fields default values are used. Additionally, the screen shots referenced in these sections may not be complete at times. For more information on installing IP Office consult [1].

IP Office is configured via the IP Office Manager program. For more information on IP Office Manager, consult reference [2]. From the IP Office Manager PC, select **Start** → **Programs** → **IP Office** → **Manager** to launch the Manager application. A screen that includes the following in the center may be displayed:

Open the IP Office configuration, either by reading the configuration from the IP Office server, or from file. The appearance of the IP Office Manager can be customized using the **View** menu. In the screens presented in this section, the View menu was configured to show the Navigation pane on the left side, the Group pane in the center, and the Details pane on the right side.

5.1. Physical, Network, and Security Configuration

This section describes attributes of the sample configuration, but is not meant to be prescriptive. Consult reference [1] for more information on the topics in this section.

In the sample configuration the IP Office 500 v2 platform contained a COMBO6210/ATM4 module. The COMBO6210/ATM4 is used to add a combination of ports to an IP500 V2 control unit and is not supported by IP500 control units. The module supports 10 voice compression channels. Codec support is G.711mu, G729a, G.723 with 64ms echo cancellation and G.722 (supported by IP Office Release 8.0 and higher). It will support 6 Digital Station ports for digital stations in slots 1-6 (except 3800, 4100, 4400, 7400, M and T-Series), 2 Analog Extension ports in slots 7-8, and 4 Analog Trunk ports in slots 9-12.

The following screen shows the modules in the IP Office used in the sample configuration. In the screen below, **IP 500 V2** is selected in the Group pane, revealing additional information about the IP 500 V2 in the Details pane.

The IP Office 500 V2 has two Ethernet ports on the back of the chassis, labeled **WAN** and **LAN**. In the reference configuration, the WAN port is connected to the AT&T network and the LAN port is connected to a local Ethernet switch. The Avaya H.323 and SIP telephones as well as the Administration/Softphone PC used in the reference configuration are also connected to this Ethernet switch.

In the IP Office Manager, the WAN port is identified as **LAN2** and the LAN port is identified as **LAN1**. Provisioning for these interfaces is described in **Section 5.3.2** and **5.3.3**.

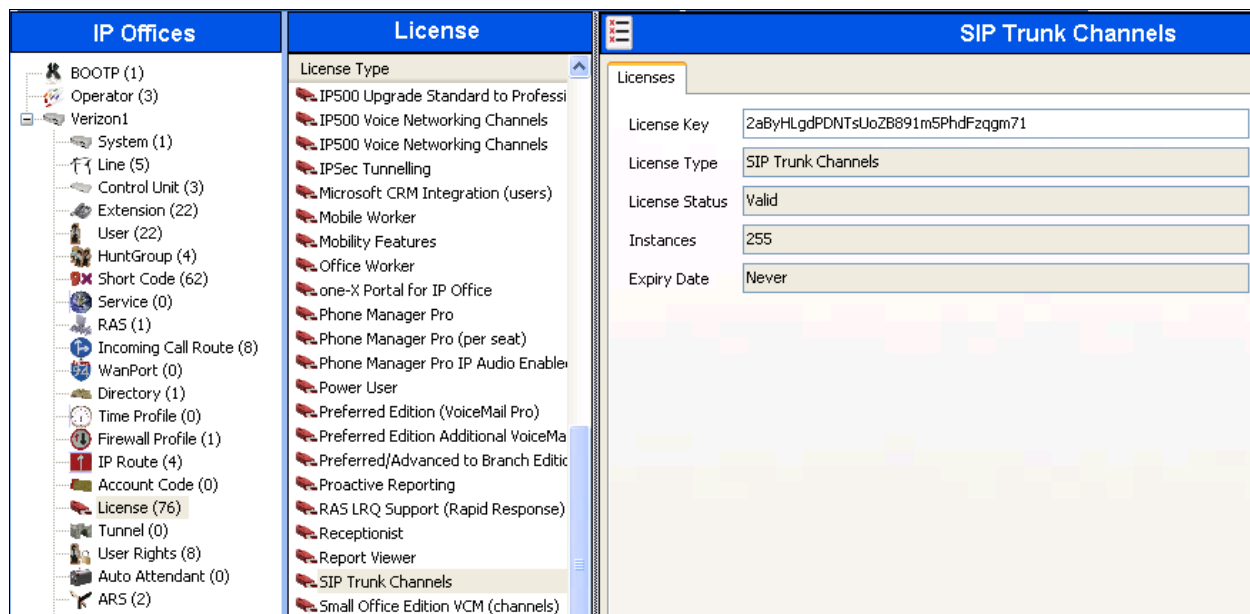

In order for the IP Office system to be able to route data to/from the AT&T network, a default route must be added specifying the reference configuration AT&T gateway (192.168.64.254). To add an IP Route in IP Office, right-click **IP Route** from the Navigation pane, and select **New**. To view or edit an existing route, select **IP Route** from the Navigation pane, and select the appropriate route from the Group pane. The following screen shows the relevant default route using **Destination** → **LAN2**.

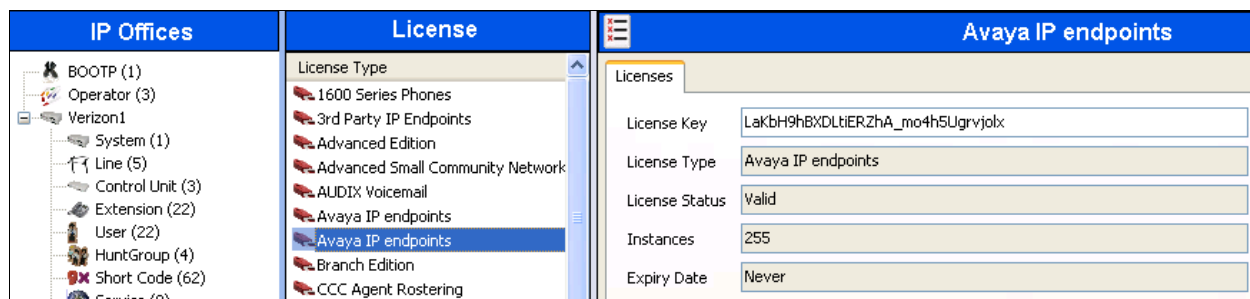

5.2. Licensing

The configuration and features described in these Application Notes require the IP Office system to be licensed appropriately. If a desired feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative.

To verify that there is a SIP Trunk Channels License with sufficient capacity, click **License** in the Navigation pane and **SIP Trunk Channels** in the Group pane. Confirm a valid license with sufficient “Instances” (trunk channels) in the Details pane.

If Avaya IP Telephones will be used, verify the Avaya IP endpoints license. Click **License** in the Navigation pane and **Avaya IP endpoints** in the Group pane. Confirm a valid license with sufficient “Instances” in the Details pane. Note that in some cases duplicate license entries may be listed (e.g. Avaya IP endpoints below). One will display a key sequence in the License Key field while the other will display “Virtual”.

The following screen shows the availability of a valid license for **Power User** features. In the sample configuration, the user with extension 500 will be configured as a “Power User”.

IP Offices	License	Power User
<ul style="list-style-type: none"> BOOTP (1) Operator (3) Verizon1 System (1) Line (5) Control Unit (3) Extension (22) User (22) HuntGroup (4) Short Code (62) Service (0) RAS (1) Incoming Call Route (8) WanPort (0) Directory (1) Time Profile (0) Firewall Profile (1) IP Route (4) Account Code (0) License (76) 	<p>License Type</p> <ul style="list-style-type: none"> IP500 Universal PRI (Additional char IP500 Upgrade Standard to Professi IP500 Voice Networking Channels IP500 Voice Networking Channels IPSec Tunnelling Microsoft CRM Integration (users) Mobile Worker Mobility Features Office Worker one-X Portal for IP Office Phone Manager Pro Phone Manager Pro (per seat) Phone Manager Pro IP Audio Enable Power User Preferred Edition (VoiceMail Pro) Preferred Edition Additional VoiceMa Preferred/Advanced to Branch Editi Proactive Reporting 	<p>Licenses</p> <p>License Key: HGJKZK5EMIRwaMqNgIzQ6_iddcVdYwdx</p> <p>License Type: Power User</p> <p>License Status: Valid</p> <p>Instances: 255</p> <p>Expiry Date: Never</p>

5.3. System Settings

This section illustrates the configuration of system settings. Select **System** in the Navigation pane to configure these settings.

5.3.1. System Tab

With the proper system name selected in the Group pane, select the **System** tab in the Details pane. The following screen shows a portion of the **System** tab. The **Name** field can be used for a descriptive name of the system. In this case, the default system serial number is used as the name. The **Avaya HTTP Clients Only** and **Enable SoftPhone HTTP Provisioning** boxes are checked to facilitate Avaya IP Office Softphone usage.

5.3.2. LAN 1 Settings

In the reference configuration, LAN1 was used to connect the IP Office to the enterprise network. To view or configure the **IP Address** of LAN1, select the **LAN1** tab followed by the **LAN Settings** tab, and enter the following:

- **IP Address:** As shown in **Figure 1**, the IP Address of the IP Office in the reference configuration is **192.168.42.1**.
- **DHCP Mode** is also set to **Server** so that IP phones will get an IP Address from the IP Office Server. Other parameters on this screen may be set according to customer requirements.
- Click the **OK** button (not shown).

Select the **LAN1 → VoIP** tab as shown in the following screen. The following settings were used in the reference configuration:

- The **H323 Gatekeeper Enable** box is checked to allow the use of Avaya IP Telephones using the H.323 protocol, such as the Avaya 1600-Series Telephones used in the reference configuration.
- The **SIP Registrar Enable** box is checked to allow Avaya 11xx (SIP) and Avaya IP Office Softphone (SIP) usage.
- **RTP Port Number:** For each VoIP call, a receive port for incoming Real Time Protocol (RTP) traffic is selected from a defined range of possible ports, using the even numbers in that range. The Real Time Control Protocol (RTCP) traffic for the same call uses the RTP port number plus 1, which is the odd numbers. For control units and Avaya H.323 IP phones, the default port range used is 49152 to 53246. On some installations, it may be a requirement to change or restrict the port range used. It is recommended that only port numbers between 49152 and 65535 are used.
 - **Port Range (minimum):** Default = **49152**. Range = 1024 to 64510. This sets the lower limit for the RTP port numbers used by the system.
 - **Port Range (maximum):** Default = **53246**. Range = 2048 to 65534. This sets the upper limit for the RTP port numbers used by the system. The gap between the minimum and the maximum must be at least 1024.

- **DiffServ Settings (optional):** If desired, IP Office can be configured to mark the Differentiated Services Code Point (DSCP) in the IP Header with specific values to support Quality of Service policies. The default values were used in the reference configuration.
- Other parameters on this screen may be set according to customer requirements.
- Click the **OK** button (not shown).

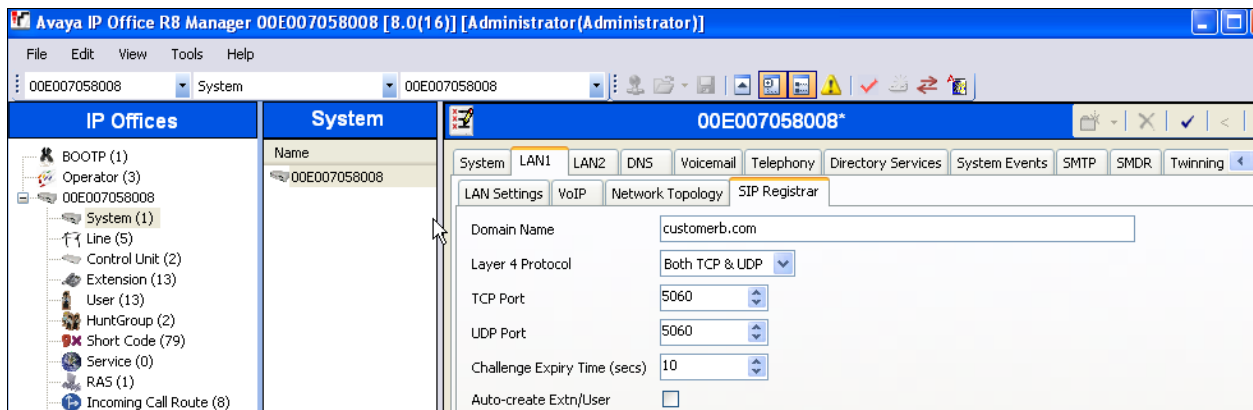

Select the **LAN1 → Network Topology** tab as shown in the following screen, and enter the following:

- **Public IP Address:** The **0.0.0.0** default value is used. This means IP Office will use the LAN1 IP address specified on the LAN1 **LAN Settings** tab described above (192.168.42.1).
- **Public Port** to **5060**.
- **Firewall/NAT Type** is set to **Open Internet**. With this configuration, STUN will not be used.
- Click the **OK** button.

Note: The **Firewall/NAT Type** parameter may need to be different, depending on the type of firewall or Network Address Translation device used at the customer premise.

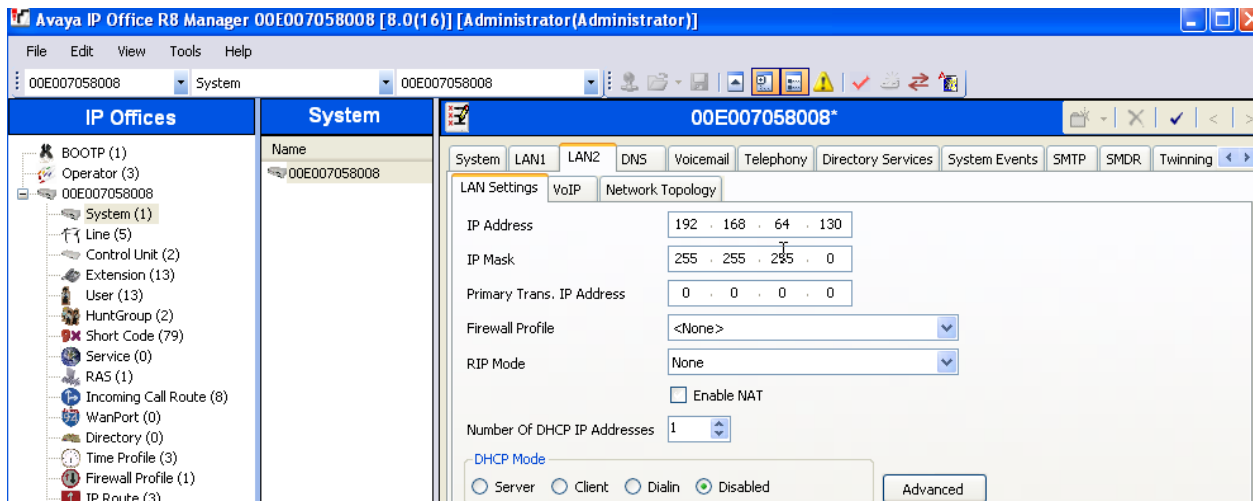

If SIP endpoints are used, select the **SIP Registrar** tab. The following screen shows the settings used in the reference configuration. Note that if the Domain Name field is left blank (default) the LAN IP address is used for registration.

5.3.3. LAN 2 Settings

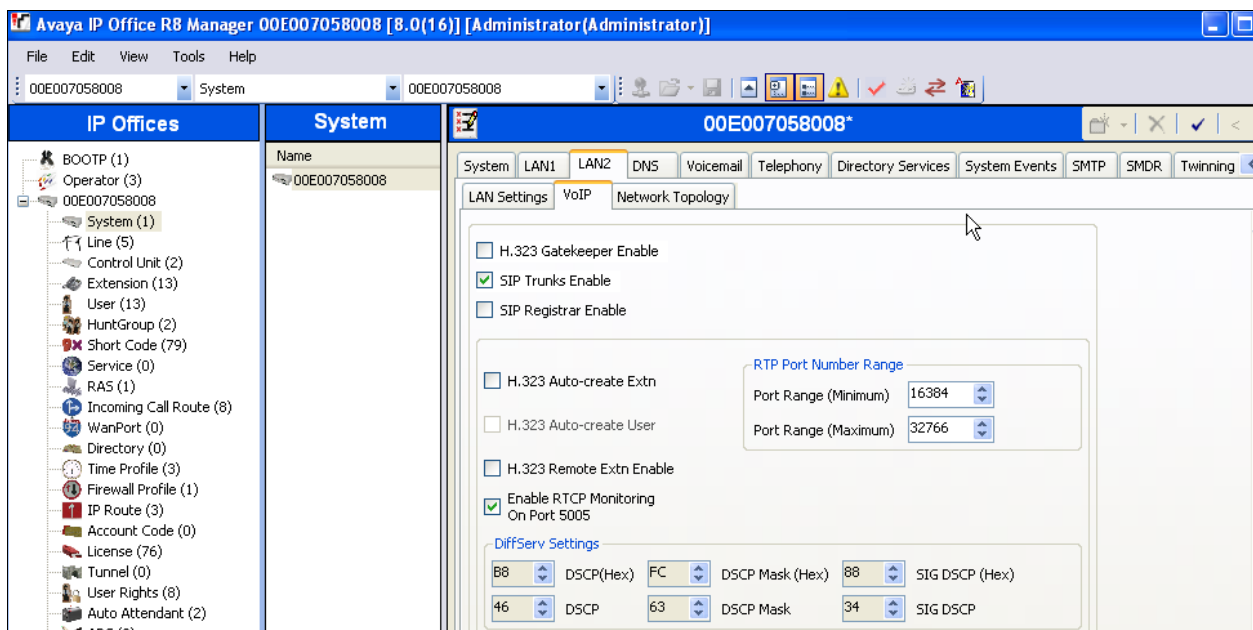

In the reference configuration, LAN2 was used to connect the IP Office to the AT&T network. To view or configure the **IP Address** of LAN2, select the **LAN2** tab followed by the **LAN Settings** tab, and enter the following:

- **IP Address:** This is the IP address of the IP Office, known to AT&T. **192.168.64.130** was used in the reference configuration.
- **DHCP Mode** is set to **Disabled** since DHCP is unnecessary towards AT&T.
- Other parameters on this screen may be set according to customer requirements.
- Click the **OK** button.

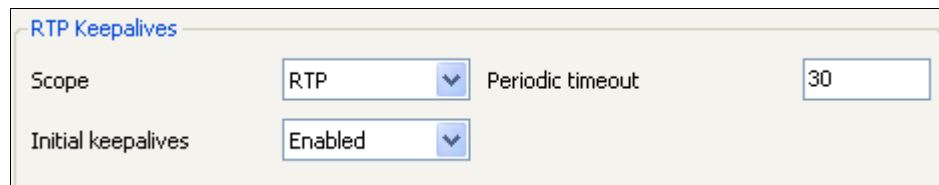

Select the LAN2 → VoIP tab as shown in the following screen and verify/enter the following:

- **H323 Gatekeeper Enable** and **SIP Registrar Enable**: These boxes are unchecked since IP telephones will not be registering on this link.
- **SIP Trunks Enable**: This box must be checked to enable the configuration of SIP trunks to AT&T.
- **RTP Port Number Range**: The AT&T IP Flexible Reach service requires that the RTP use the port range 16384 to 32767.
 - **16384** is entered in the **Port Range (Minimum)** field
 - **32766** is entered in the **Port Range (Maximum)** field, as this field requires even numbers. See **Section 5.3.2** for more information on the RTP settings.

OPTIONAL: As described in **Section 2.2 Item 4**, a no audio condition was observed in the AT&T test network environment when an inbound PSTN call was forwarded back to PSTN or twinned to a mobile phone. The workaround for this issue was to enable **RTP Keepalives** on the **LAN2 → VoIP** tab. Scrolling down to the bottom of the form, enter the following:

- **Scope:** Select **RTP**
- **Periodic Timeout:** Enter **30**
- **Initial keepalives:** Select **Enabled**

RTP Keepalives	
Scope	RTP
Periodic timeout	30
Initial keepalives	Enabled

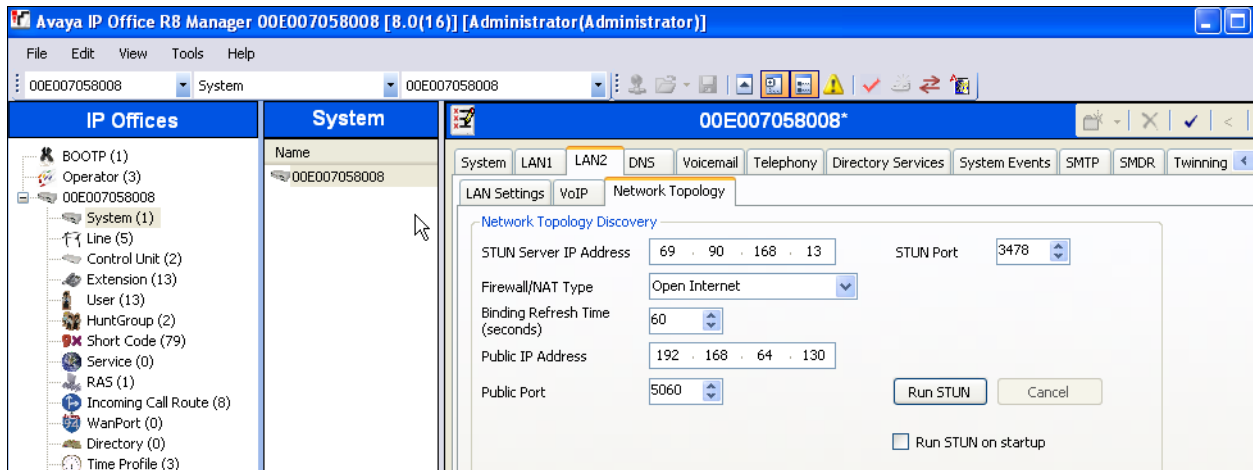

- Let all other values default.
- Click the **OK** button.

Select the **LAN2 → Network Topology** tab as shown in the following screen, and enter the following:

- **Public IP Address:** Enter the Avaya IP Office LAN2 IP address **192.168.64.130** defined in the LAN2 LAN Settings tab above.
- **Firewall/NAT Type** is set to **Open Internet**. With this configuration, STUN will not be used.
- **Binding Refresh Time** can be configured to vary SIP OPTIONS timing. A value of **60** seconds was used in the reference configuration (see **Section 5.11** for more information on SIP Options timing between IP Office and AT&T).

Note – In the reference configuration IP Office sent OPTIONS to the AT&T Business in a Box® over IP Flexible Reach service Border Element and AT&T responded with *405 Method Not Allowed* (which is the expected response). That response is sufficient for IP Office to consider the connection up. The AT&T Business in a Box® over IP Flexible Reach service Border Element does *not* send OPTIONS to IP Office.

- **Public Port** to **5060**.
- Click the **OK** button.

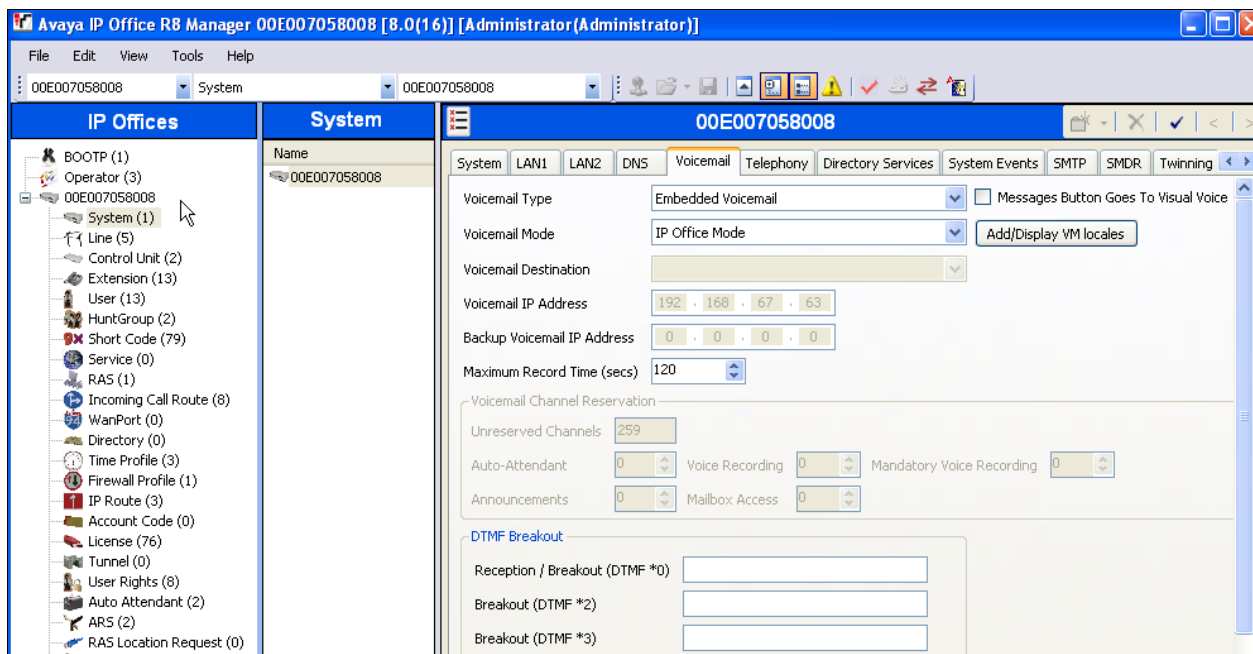

Note that since **SIP Registrar Enable** was unchecked on the LAN2 **VOIP** tab, the SIP Registrar Tab is not present for LAN2.

5.3.4. Voicemail

As described in **Sections 1 and 2**, the IP Office embedded voicemail was used in the reference configuration. To view or change voicemail settings, select the **Voicemail** tab as shown in the following screen. The settings presented here simply illustrate the reference configuration and are not intended to be prescriptive.

- **Voicemail Type: Embedded Voicemail** was used in the reference configuration.
- **Voicemail Mode: IP Office Mode** was used in the reference configuration.
- Other parameters on this screen may be set according to customer requirements.
- Click the **OK** button.

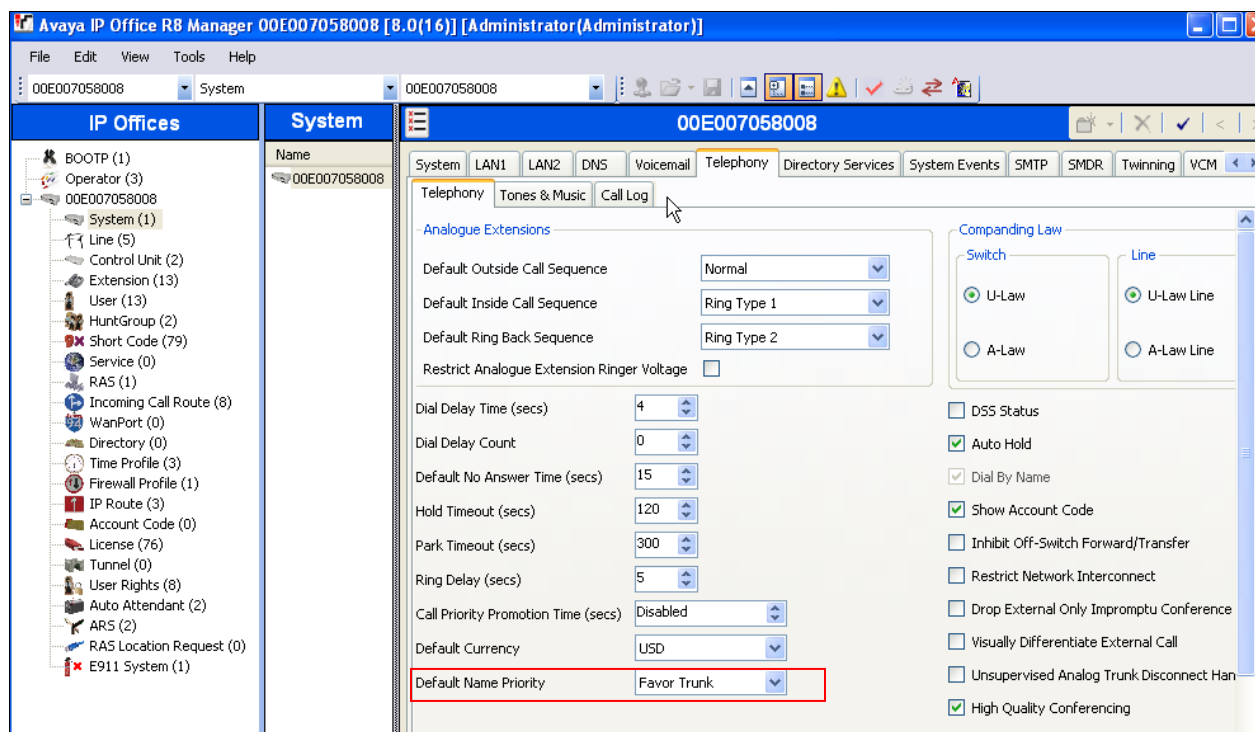

5.3.5. System Telephony Configuration

To view or change telephony settings, select the **Telephony** tab and **Telephony** sub-tab as shown in the following screen. The settings presented here simply illustrate the sample configuration and are not intended to be prescriptive.

In the sample configuration, the **Inhibit Off-Switch Forward/Transfer** box is unchecked so that call forwarding and call transfer to PSTN destinations via the AT&T Business in a Box® over IP Flexible Reach service can be tested.

The **Companding Law** parameters are set to “ULAW” as is typical in North American locales. Other parameters on this screen may be set according to customer requirements.

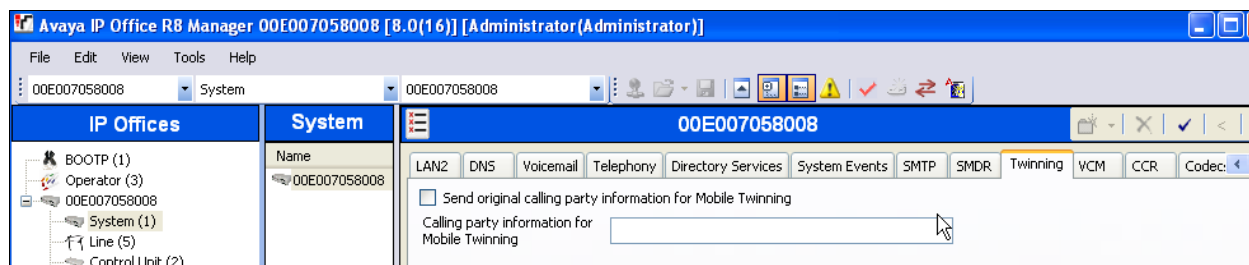

OPTIONAL: The **Default Name Priority** is a new field in IP Office Release 8 and can be relevant to SIP Trunking. The option to **Favor Trunk** or **Favor Directory** can be set system-wide using the screen below, or set uniquely for each line. **Favor Trunk** was used in the reference configuration. With the option set to **Favor Directory**, IP Office will prefer to display names found in a personal or system directory over those arriving from the far-end, if there is a directory match to the caller ID. This capability is also defined in the **SIP Line** tab in **Section 5.4**. A user’s personal directory example is shown in **Section 5.5.2**.

5.3.6. System Twinning Configuration

To view or change Twinning settings, select the **Twining** tab as shown in the following screen. The **Send original calling party information for Mobile Twinning** box is not checked, and the **Calling party information for Mobile Twinning** is left blank, in the reference configuration.

With this configuration, and related configuration of Diversion Header on the SIP Line (**Section 5.4**), the true identity of a PSTN caller can be presented to the twinning destination (e.g., a user's mobile phone) when a call is twinned out via the AT&T Business in a Box® over IP Flexible Reach service.

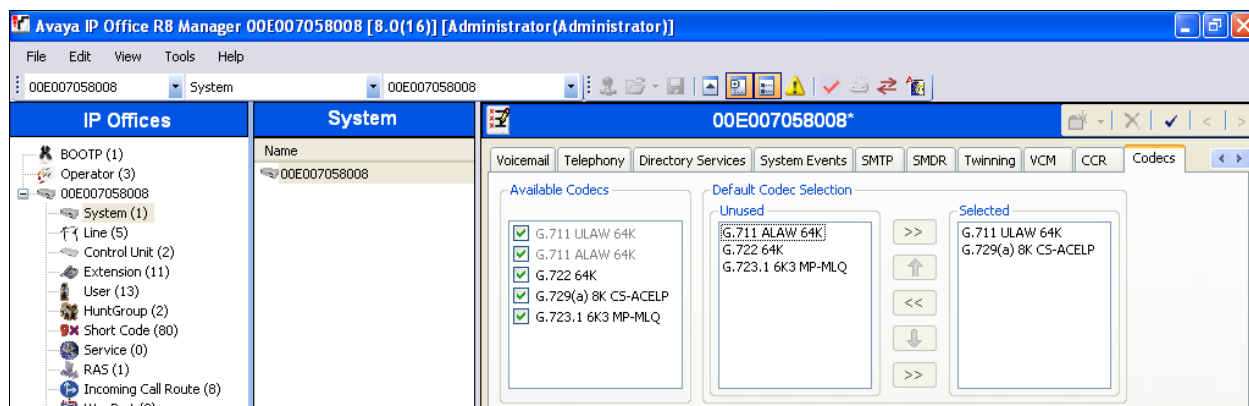

5.3.7. System Codecs Configuration

The **System → Codecs** tab is new in IP Office Release 8. On the left, observe the list of **Available Codecs**. By selecting codecs in this column, they will appear in the **Default Codec Selection → Unused** column. Codecs may be selected from the **Unused** list and moved to the **Selected** column by use of the >> button, thereby making the selected codecs available in other screens where codec configuration may be performed (e.g., SIP Lines and Extensions).

The up and down arrow buttons are used to order the selected codecs. By default, all IP lines (including the SIP Line) and extensions will assume the system default **Selected** codec list, unless configured otherwise for the specific line or extension. When completed, click on **OK** (not shown).

Note - In the reference configuration the System and Extension codec lists (see **Section 5.5**) specify G.711mu and G.729 (in that order), and the SIP Line (see **Section 5.4.3**) offers G.729 and G.711 (in that order). In this manner local IP Office calls will offer G.711 first, and SIP trunk calls will offer G.729 first.

5.4. SIP Line

The **SIP Line** tab in the Details pane is shown below for **Line Number 17**, used for the AT&T SIP Trunk. Note, if no SIP Line exists, right click on the **Line** item in the **Navigation** pane and select **New → SIP Line**. SIP Line 17 will be the first SIP Line number created. The SIP Line form is completed as follows:

- **ITSP Domain Name:** Set to the IP Office LAN2 address as defined in **Section 5.3.3** (192.168.64.130).
- **In Service** and **Check OOS:** These boxes are checked (default).
- **Call Routing Method:** Specify matching for **Incoming Call Routes** (**Section 5.7**). Matched values based on the **Request URI**, or **To Header** contents, may be selected. In the sample configuration, the default **Request URI** setting was used.
- **Country Code:** Use the default <blank>.
- **Send Caller ID:** Set to **Diversion Header**. This is required by the AT&T Business in a Box® over IP Flexible Reach service for call redirection scenarios (e.g., Call Forward, Mobile Twinning).
- **REFER Support:** Check this box and select **Never** from the **Incoming** and **Outgoing** drop-down menus to ensure that Refer is disabled. The AT&T Business in a Box® over IP Flexible Reach service does not support Refer.
- Use the default values for the other fields.
- Click **OK** (not shown).

Optional: As described in **Section 5.3.5**, the **Name Priority** parameter is new in IP Office Release 8.0. On this form it may retain the default **Favor Trunk** setting, or can be configured to **Favor Directory**. The default **Favor Trunk** setting was used in the reference configuration.

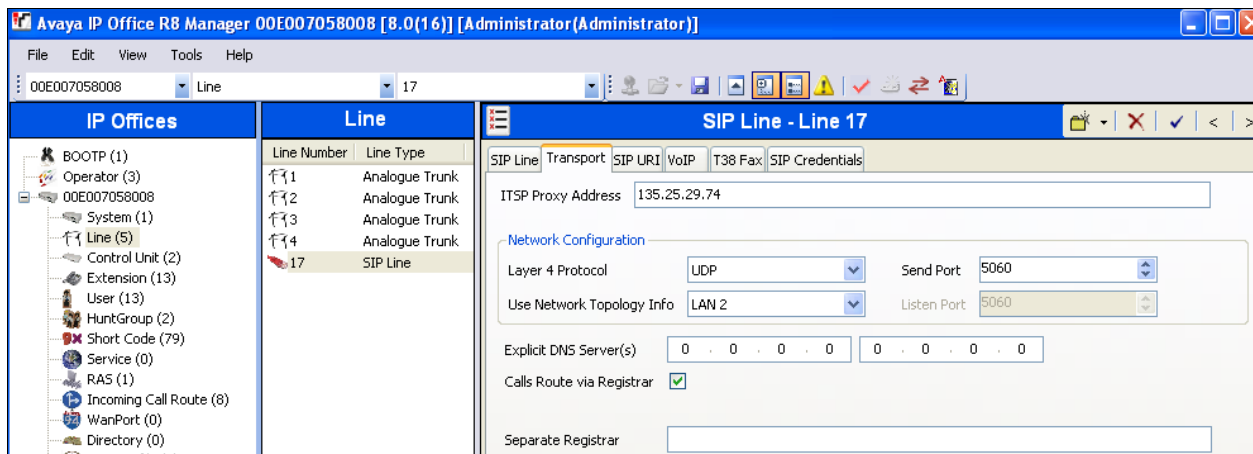

The screenshot shows the Avaya IP Office R8 Manager interface. The main window is titled "Avaya IP Office R8 Manager 00E007058008 [8.0(16)] [Administrator/Administrator]". The left pane shows a tree view of the system configuration, with "Line" selected. The right pane shows the "SIP Line - Line 17" configuration form. The form has tabs for "SIP Line", "Transport", "SIP URI", "VoIP", "T38 Fax", and "SIP Credentials". The "SIP Line" tab is active. The form contains the following fields and settings:

- Line Number: 17
- ITSP Domain Name: 192 . 168 . 64 . 130
- In Service: ☒
- Use Tel URI: ☐
- Check OOS: ☒
- Call Routing Method: Request URI
- Originator number for forwarded and twinning calls: (empty)
- Name Priority: Favor Trunk (highlighted with a red box)
- Association Method: By Source IP address
- REFER Support: ☒
- Incoming: Never
- Outgoing: Never

5.4.1. SIP Line - Transport Tab

Select the **SIP Line → Transport** tab and configure the following:

- **ITSP Proxy Address:** Set to the AT&T Business in a Box® over IP Flexible Reach Border Element IP address (e.g., **135.25.29.74**).
- **Network Configuration → Layer 4 Protocol:** Set to **UDP**.
- **Network Configuration → Send Port:** Set to **5060** (default).
- **Network Configuration → Use Network Topology Info:** Set to **LAN 2**. This associates the SIP Line with the parameters in the **System → LAN2 → Network Topology** tab.
- **Calls Route via Registrar:** Enabled (default).
- **Click OK** (not shown).

5.4.2. SIP Line - SIP URI Tab

Select the **SIP Line → SIP URI** tab. On this form a list of the DNIS digits delivered by AT&T is created. To add a new SIP URI, click the **Add...** button. In the bottom of the screen, a **New Channel** area will be opened. Entries may be specified in two ways:

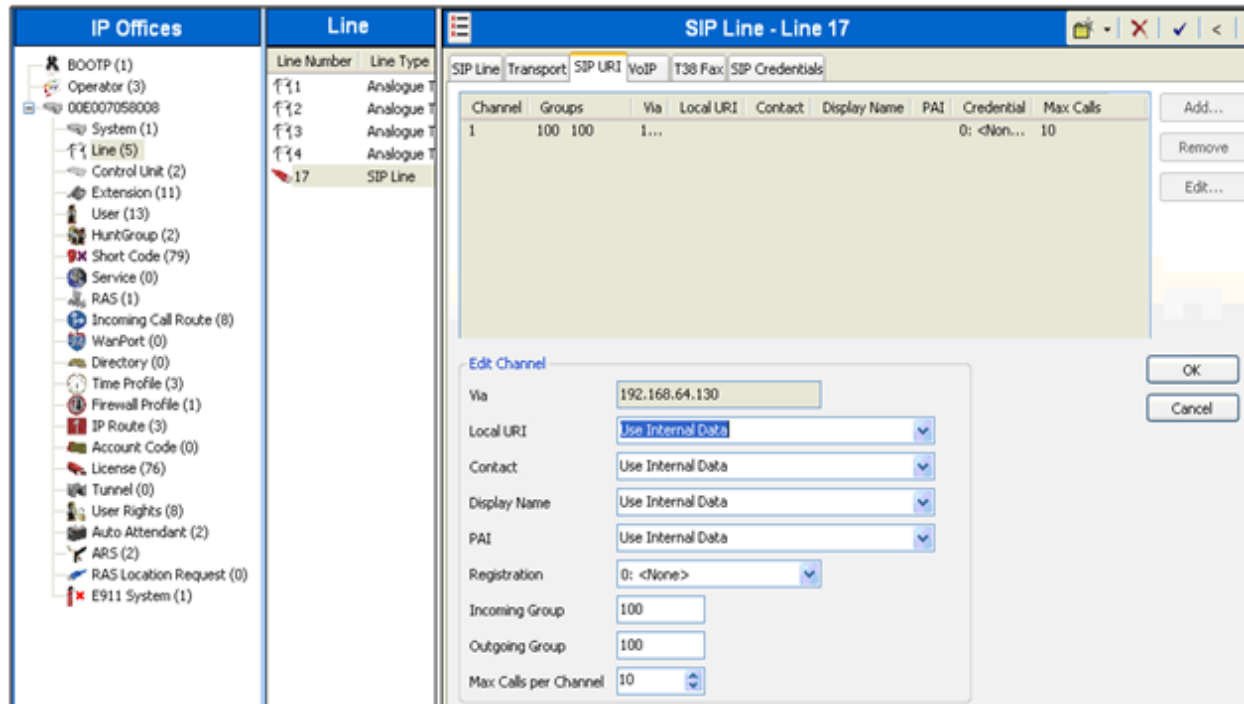

1. A “wild-card” entry that will use the contents of SIP headers containing “calling” information.

Note - When this method is used, the inbound AT&T DNIS digits must be specified for an IP Office User or Hunt Group on its corresponding **SIP** tab (see **Section 5.5**). Otherwise the call will be denied.

In this method the following information is specified:

- **Local URI, Contact, Display Name, and PAI:** Set to **Use Internal Data**
- **Registration:** Set to the default **0: <None>**.
- **Incoming Group:** Set here to **100**. This value references the **Incoming Call Routes** in **Section 5.7**.
- **Outgoing Group:** Set to **100**. This will be used for routing outbound calls to AT&T via the **Short Codes** (**Section 5.6**) or **ARS** configuration (**Section 5.8**).

- **Max Calls per Channel:** In the reference configuration this was set to **10**. This sets the maximum number of simultaneous calls that can use the URI before IP Office returns busy to any further calls.
- Click **OK** to save the information.

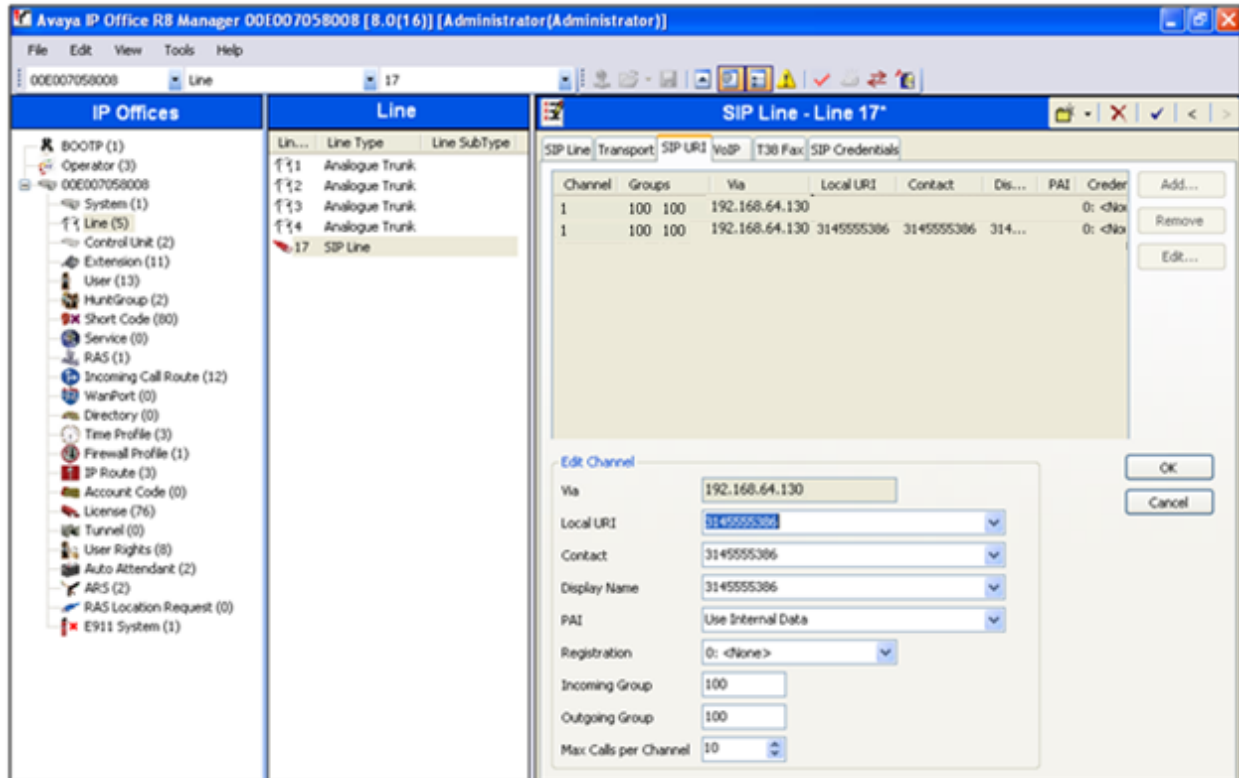

2. A specific entry that will match inbound DNIS digits from AT&T.

Note – This method must be used for IP Office call destinations other than Users or Hunt Groups or the calls will be denied.

In this method the following information is specified:

- **Local URI, Contact, and Display Name:** Set to an AT&T DNIS number (e.g. **3146665386**).
- **PAI:** Set to **Use Internal Data**. When set, IP Office will use PAI for privacy signaling (see **Section 5.6.3**).
- **Registration:** Set to the default **0: <None>**.
- **Incoming Group:** Set here to **100**. This value references the **Incoming Call Routes** in **Section 5.7**.
- **Outgoing Group:** Set to **100**. This will be used for routing outbound calls to AT&T via the **Short Codes** (**Section 5.6**) or **ARS** configuration (**Section 5.8**).
- **Max Calls per Channel:** In the reference configuration to this was set to **10**. This sets the maximum number of simultaneous calls that can use the URI before IP Office returns busy to any further calls.
- Click **OK** to save the information.

- To edit an existing entry, click an entry in the list (e.g., **Channel 2 → 3145555386**), and click the **Edit...** button. In the bottom of the screen, the **Edit Channel** area will be opened.
- When all SIP URI entries have been added/edited, click **OK** at the bottom of the screen (not shown).

5.4.3. SIP Line - VoIP Tab

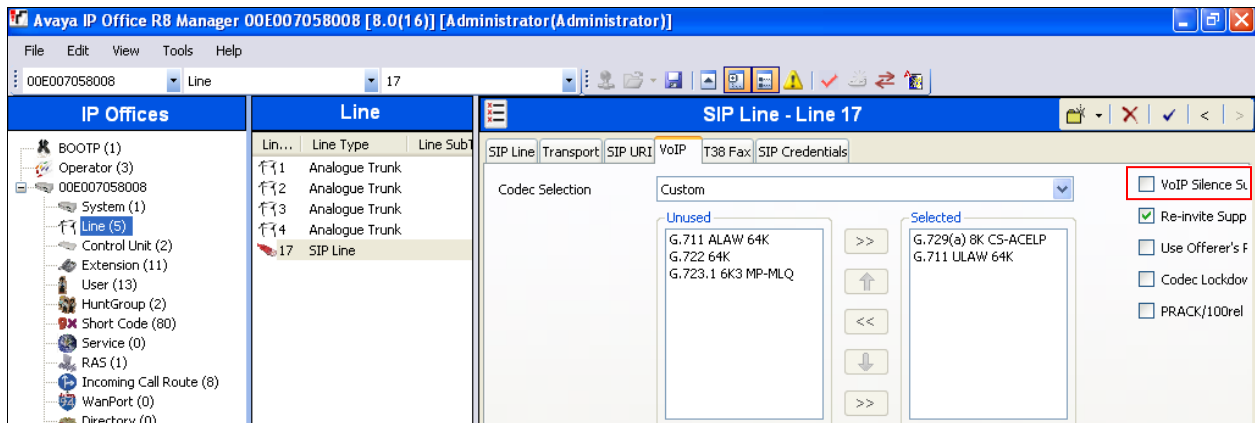

Select the **VoIP** tab. The **Codec Selection** drop-down box → **System Default** will list all available codecs, in the sample configuration, **Custom** was selected and **G729(a) 8K CS-ACELP**, and **G.711 ULAW 64K** were specified. This will cause IP Office to include these codecs in the Session Description Protocol (SDP) offer, and in the order specified. Note that G.729 is set as the preferred codec on the connection to the AT&T Business in a Box® over IP Flexible Reach network.

- Set the **Fax Transport Support** drop-down menu to **T38**. Note that the **T38 Fallback** and **G.711** options are *not* supported in the reference configuration (see **Section 2.2**). Note that Error Correction Mode (ECM) is enabled by default on the T.38 Fax tab (**Section 5.4.4**). ECM is supported by the AT&T Business in a Box® over IP Flexible Reach service.
- The **DTMF Support** parameter can remain set to the default value **RFC2833**.
- The **Re-invite Supported** parameter can be checked to allow for codec re-negotiation in cases where the target of an incoming call or transfer does not support the codec originally negotiated on the trunk.
- The **Codec Lockdown** parameter may retain the default un-checked value.

- Click **OK** (not shown).

Since the AT&T Business in a Box® over IP Flexible Reach service does not require registration, the **SIP Credentials** tab need not be visited.

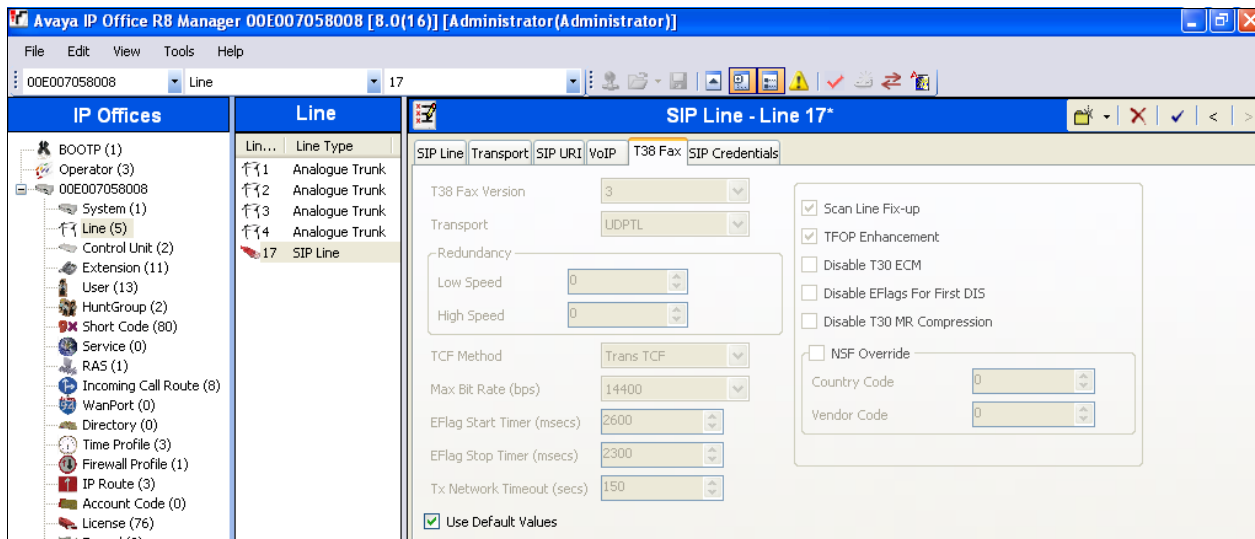

Note that the VoIP Silence Suppression box is ***not*** checked (default). This disables the use of the G.729B codec (see **Section 2.2**)

5.4.4. SIP Line - T38 Fax

Note - The settings on this tab are only accessible if **Re-invite Supported** and a **Fax Transport Support** option are selected on the **VoIP** tab (**Section 5.4.3**).

Note - All default values were used in the reference configuration. Therefore the **Use Default Values** box is checked. If different settings are needed, uncheck this box to unlock the form.

5.5. Users, Extensions, and Hunt Groups

In this section, examples of IP Office Users, Extensions, and Hunt Groups will be illustrated. To add a User, right click on **User** in the Navigation pane, and select **New**. To edit an existing User,

select **User** in the Navigation pane, and select the appropriate user to be configured in the Group pane.

5.5.1. Analog User Extn207

The following screen shows the **User** tab for User **Extn207**. This user corresponds to the Avaya Analog 6211 set.

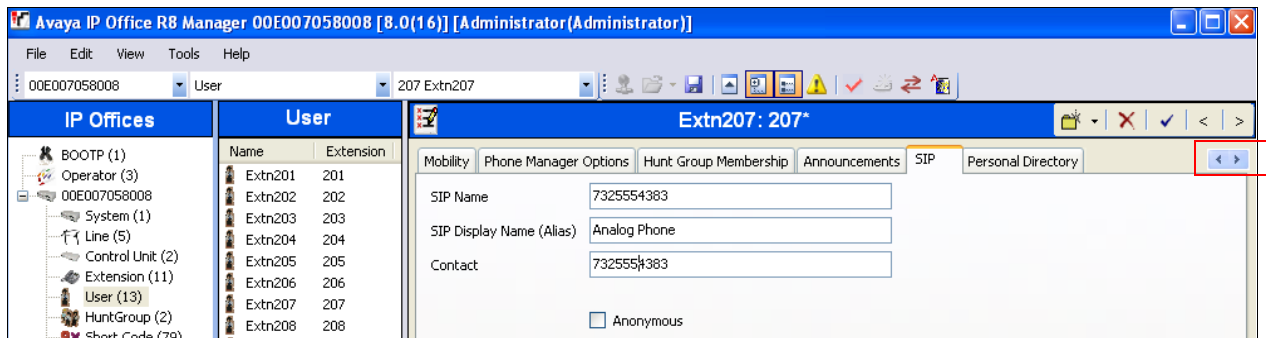

IP Offices		User		Extn207: 207																																					
<ul style="list-style-type: none"> BOOTP (1) Operator (3) 00E007058008 System (1) Line (5) Control Unit (2) Extension (11) User (13) HuntGroup (2) Short Code (79) Service (0) RAS (1) Incoming Call Route (0) WanPort (0) Directory (0) Time Profile (3) Firewall Profile (1) IP Route (3) Account Code (0) License (76) Tunnel (0) User Rights (8) Auto Attendant (2) ARS (2) RAS Location Request (0) E911 System (1) 		<table border="1"> <thead> <tr> <th>Name</th> <th>Extension</th> </tr> </thead> <tbody> <tr><td>Extn201</td><td>201</td></tr> <tr><td>Extn202</td><td>202</td></tr> <tr><td>Extn203</td><td>203</td></tr> <tr><td>Extn204</td><td>204</td></tr> <tr><td>Extn205</td><td>205</td></tr> <tr><td>Extn206</td><td>206</td></tr> <tr><td>Extn207</td><td>207</td></tr> <tr><td>Extn208</td><td>208</td></tr> <tr><td>Extn500</td><td>500</td></tr> <tr><td>Extn600</td><td>600</td></tr> <tr><td>Extn700</td><td>700</td></tr> <tr><td>NoUser</td><td></td></tr> <tr><td>Remote...</td><td></td></tr> </tbody> </table>		Name	Extension	Extn201	201	Extn202	202	Extn203	203	Extn204	204	Extn205	205	Extn206	206	Extn207	207	Extn208	208	Extn500	500	Extn600	600	Extn700	700	NoUser		Remote...		<div> <div> <div>User</div> <div>Voicemail</div> <div>DND</div> <div>ShortCodes</div> <div>Source Numbers</div> <div>Telephony</div> <div>Forwarding</div> <div>Dial In</div> <div>Voice Recording</div> <div>Button Pr</div> </div> <div> <div>Name</div> <div>Extn207</div> </div> <div> <div>Password</div> <div></div> </div> <div> <div>Confirm Password</div> <div></div> </div> <div> <div>Full Name</div> <div>Analog Phone</div> </div> <div> <div>Extension</div> <div>207</div> </div> <div> <div>Locale</div> <div></div> </div> <div> <div>Priority</div> <div>5</div> </div> <div> <div>System Phone Rights</div> <div>None</div> </div> <div> <div>Profile</div> <div>Basic User</div> </div> <div> <div>Receptionist</div> <div><input type="checkbox"/></div> </div> <div> <div>Enable Softphone</div> <div><input type="checkbox"/></div> </div> <div> <div>Enable one-X Portal Services</div> <div><input type="checkbox"/></div> </div> <div> <div>Enable one-X TeleCommuter</div> <div><input type="checkbox"/></div> </div> <div> <div>Enable Remote Worker</div> <div><input type="checkbox"/></div> </div> <div> <div>Ex Directory</div> <div><input type="checkbox"/></div> </div> <div> <div>Device Type</div> <div>Analogue Handset</div> </div> </div>

Extn600	600																																								
Extn700	700																																								
NoUser																																									
Remote...																																									

The following screen shows the **SIP** tab for User **Extn207** (use the arrow buttons in the upper right corner to navigate to the SIP tab). The **SIP Name** and **Contact** parameters are configured with the associated AT&T DNIS number of the user, (e.g., **7325554383**). These parameters configure the user part of the SIP URI in the From header for outgoing SIP trunk calls, and allow matching of the SIP URI for incoming calls, without having to enter this number as an explicit SIP URI for the SIP Line (see **Section 5.4.2**).

The **SIP Display Name (Alias)** parameter can optionally be configured with a descriptive name.

If all calls involving this user and a SIP Line should be considered private, then the **Anonymous** box may be checked to withhold the user's information from the network (see **Section 5.10**).

See **Section 5.6** for a method of using a Short Code (rather than static user provisioning) to place an anonymous call.

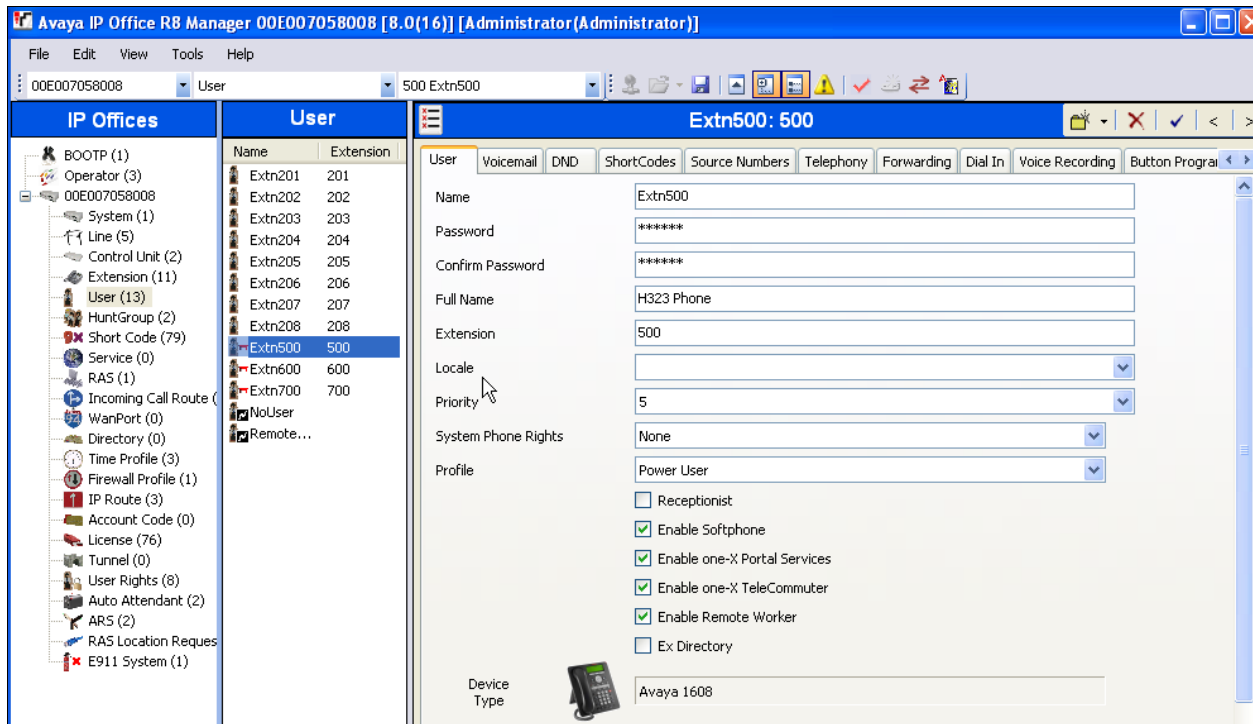

The following screen shows the Extension information for this user. To view, select **Extension** from the Navigation pane, and the appropriate extension from the Group pane (e.g., **207**).

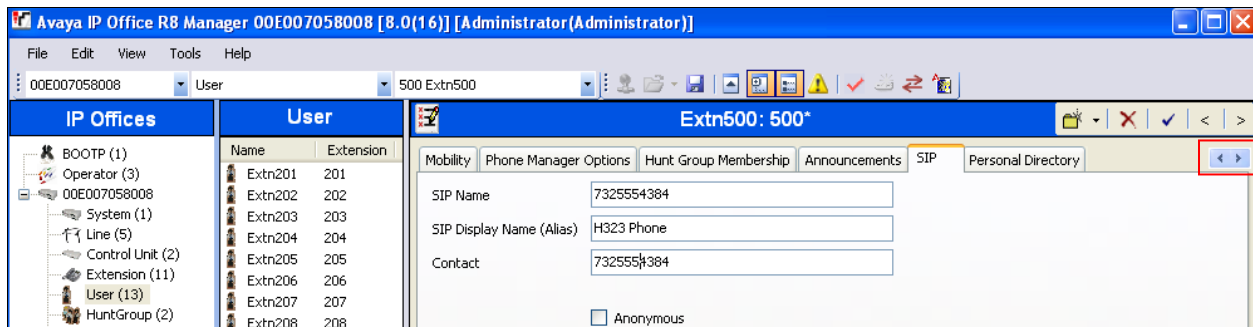

5.5.2. IP Phone User Extn500

To create a new extension, right click on **Extension** from the Navigation pane and select **New** and **H.323**. Alternatively edit an existing extension by selecting an extension in the Group pane. The following screen shows a 1608 IP Telephone provisioned in the **User** tab for User **Extn500**. In the reference configuration, this user will be granted “Power User” features.

- **Password:** This password is used by user applications such as SoftConsole, Phone Manager and TAPI. It is also used for users with Dial In access. Note that this is **not** the user's phone log in code (see the information on the **Telephony** tab → **Supervisor Settings** below), or their voicemail mailbox password (see information on the **VoiceMail** tab below).
- The **Profile** parameter is set to **Power User**.
- The **Enable Softphone** box is checked, along with other advanced capabilities.

Like the Analog Extn207 user, the **SIP** tab (use the arrow buttons in the upper right corner to navigate to the SIP tab) for User Extn500 is configured with a **SIP Name** and **Contact** specifying the user's associated AT&T DNIS number (e.g., **7325554384**).

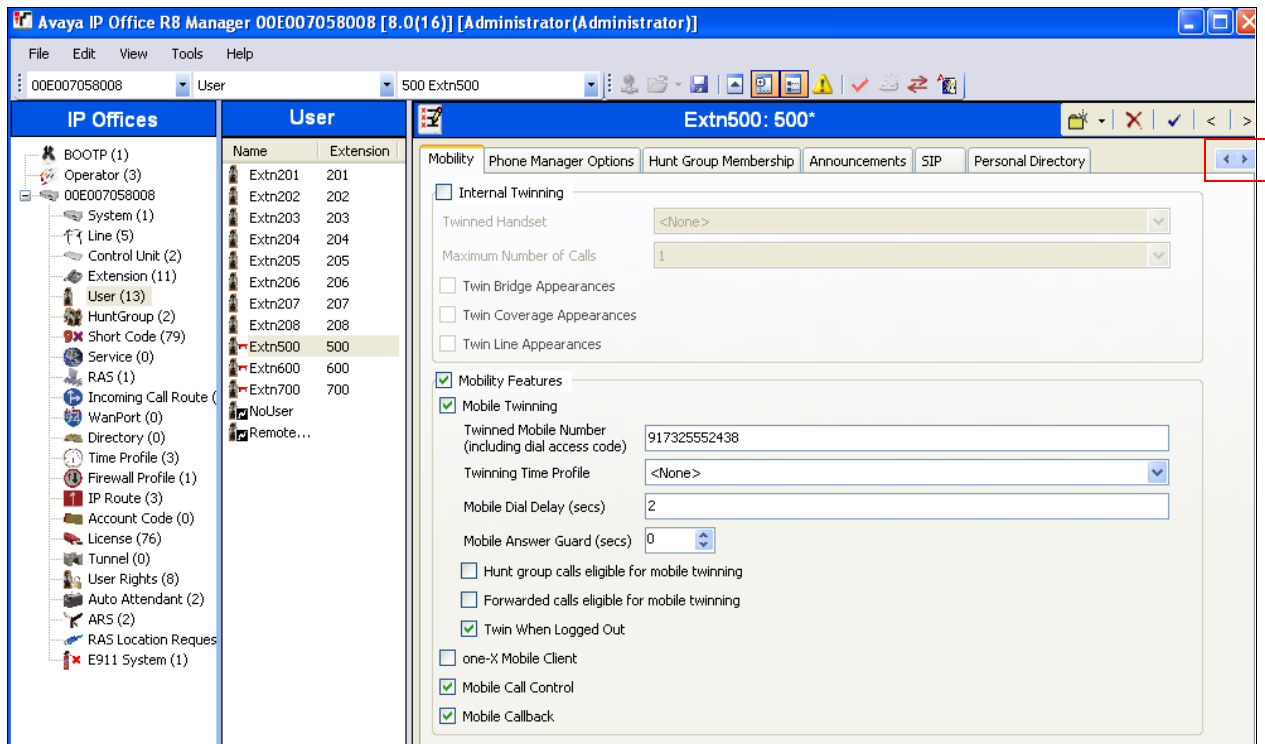

User Extn500 will use the Mobile Twinning feature. The following screen shows the **Mobility** tab for User Extn500 (use the arrow buttons in the upper right corner to navigate to the Mobility tab).

The **Mobility Features**, **Mobile Twinning**, **Mobile Call Control**, and **Mobile Callback** boxes are checked.

The **Twinned Mobile Number** field is configured with the number to dial to reach the twinned mobile telephone, in this case **917325552438** (note that the outbound call access code **9** is specified, as described for the Short Code 9N; in **Section 5.6.1**).

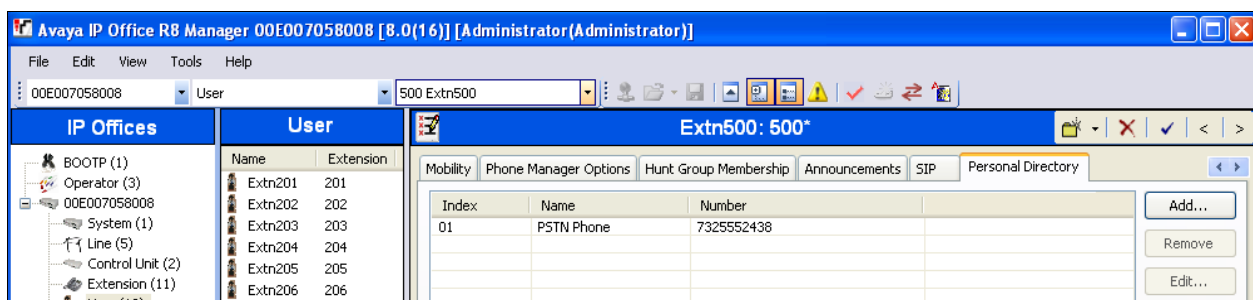

The **Mobile Call Control** and **Mobile Callback** features are accessed via Short Codes (as shown in **Section 5.6** and Incoming Call Routes as shown in **Section 5.7**).

IP Office Release 8 offers a feature where users can define names in a Personal Directory, and display these names, based on the inbound calling number.

The following screen shows the **Personal Directory** tab for User Extn500. With the configuration shown below, if User Extn500 receives an inbound AT&T call from the telephone number **7325552438**, the phone will display the name “PSTN Phone” (along with the number), even if AT&T provided a different name in the SIP INVITE message sent to IP Office.

Note – In the reference configuration, the SIP Line is configured with **Name Priority → Favor Trunk** (see **Section 5.4**). This setting needs to be changed to **Name Priority → Favor Directory**, to enable this feature.

The following screen shows the **VoiceMail** tab for User Extn500. The **VoiceMail On** box is checked, and a voicemail password can be configured using the **VoiceMail Code** and **Confirm VoiceMail Code** parameters.

Voice mail navigation and retrieval were performed locally and from PSTN telephones, to test DTMF using RFC 2833, and to test assignment of an AT&T DNIS number to the “Voicemail Collect” feature (e.g., via the *17 Short Code shown in **Section 5.6**). Note that the second configuration option described in the **SIP Line → SIP URI** tab (**Section 5.4.2**) is required for this type of inbound call to work.

The screenshot shows the Avaya IP Office R8 Manager interface. The left pane displays a tree view of the system configuration, including IP Offices, Users, and Extensions. The right pane shows the configuration for Ext500: 500, with the Voicemail tab selected. The configuration includes fields for Voicemail Code, Confirm Voicemail Code, and Voicemail Email. There are also checkboxes for Voicemail On, Voicemail Help, Voicemail Ringback, Voicemail Email Reading, and UMS Web Services. A section for DTMF Breakout allows setting Reception / Breakout (DTMF *0), Breakout (DTMF *2), and Breakout (DTMF *3) to System Default or other options.

Select the **Telephony → Supervisor Settings** tab as shown below. The **Login Code** will be used by the telephone user as the phone login password.

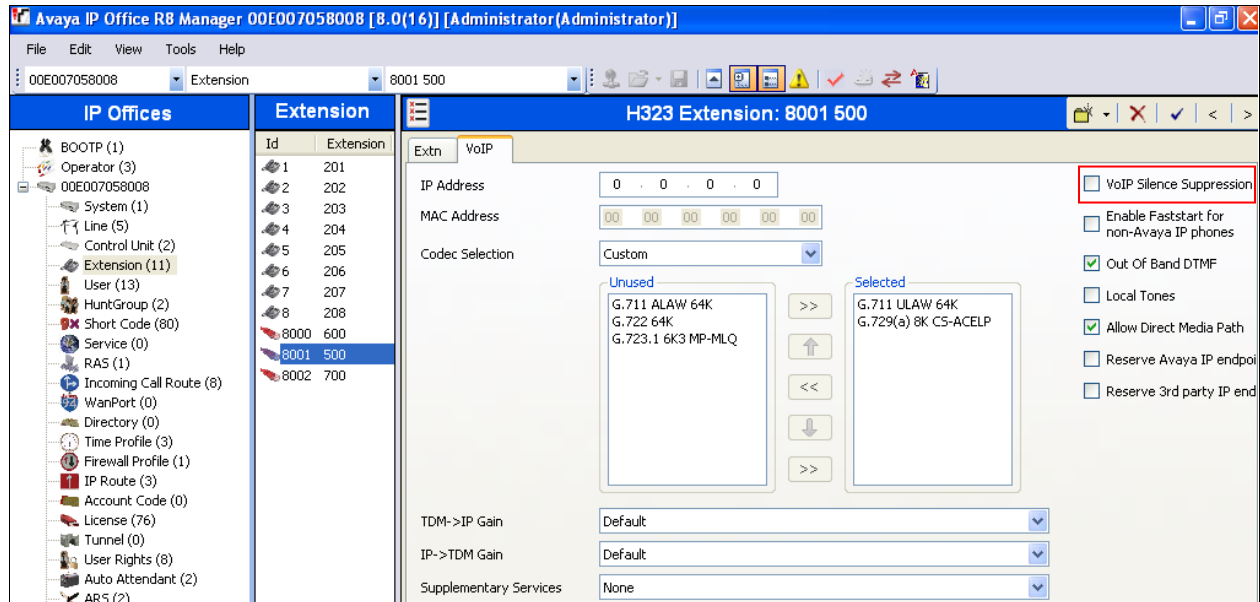

The screenshot shows the Avaya IP Office R8 Manager interface, with the Supervisor Settings tab selected for Ext500: 500. The configuration includes fields for Login Code, Login Idle Period (secs), Monitor Group, Coverage Group, and Status on No-Answer. There are also checkboxes for Force Login, Force Account Code, Outgoing Call Bar, Inhibit Off-Switch Forward/Transfer, Can Intrude, Cannot be Intruded, Can Trace Calls, CCR Agent, and Automatic After Call Work. A section for Reset Longest Idle Time allows selecting All Calls or External Incoming. The After Call Work Time (secs) is set to System Default (10).

The following screen shows the Extension information for this user, to illustrate the **VoIP** tab available for an IP Telephone. To view, select **Extension** from the Navigation pane, and the appropriate extension (**500**) from the Group pane. Select **VoIP** in the Details pane.

- Use the **IP Address** field default value (**0.0.0.0**).

- Note that the same codec list as shown in **Section 5.3.7** is used.
- Use defaults for the remaining fields.

Note that the VoIP Silence Suppression box is **not** checked (default). This disables the use of the G.729B codec (see **Section 2.2**)

5.5.3. SIP Telephone Users (Avaya 1120E and IP Office SoftPhone)

In the reference configuration, an Avaya 1120E SIP telephone and IP Office SoftPhone were provisioned as SIP users. To create a new extension, right click on **Extension** from the Navigation pane and select **New** and **SIP**. Alternatively edit an existing extension by selecting an extension in the Group pane.

5.5.3.1 SIP Avaya 1120E

The following screen shows an 1120E Telephone provisioned in the **User** tab for User **Extn600**.

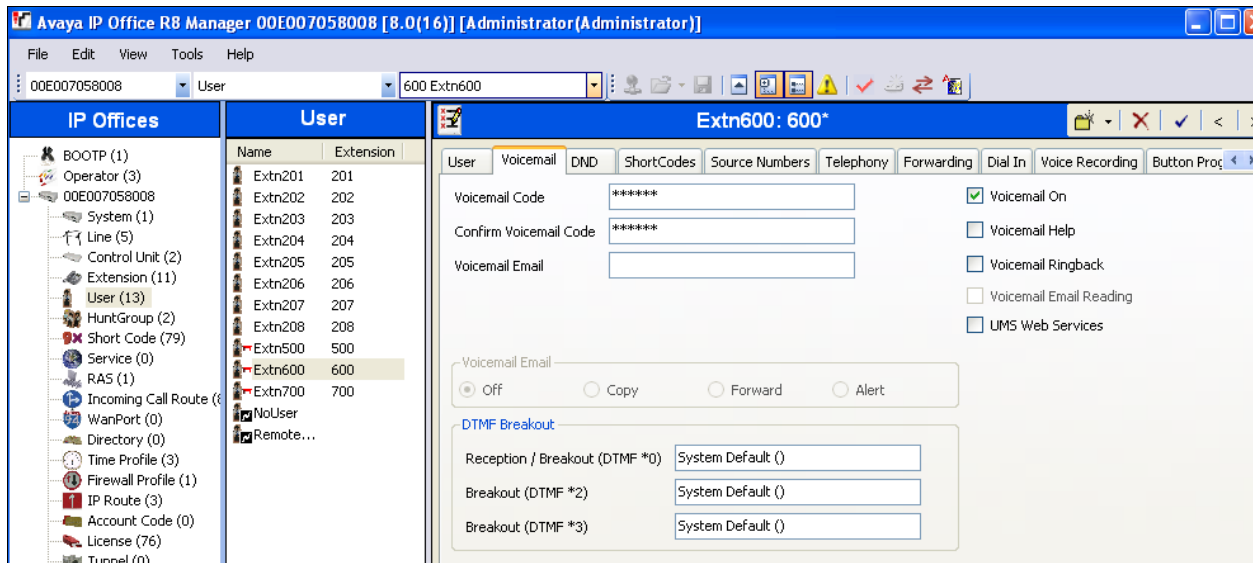

- **Password:** This password is used by user applications such as SoftConsole, Phone Manager and TAPI. It is also used for users with Dial In access. Note that this is **not** the user's phone log in code (see the information on the **Telephony** tab → **Supervisor Settings** below), or their voicemail mailbox password (see the **VoiceMail** tab below).
- In the reference configuration, the **Profile** parameter is set to **Basic User** (default). User Extn600 does not have the Mobile feature capabilities in the reference configuration.

SIP Name	7325554385																															
SIP Display Name (Alias)	SIP Phone																															
Contact	7325554385																															
<input type="checkbox"/> Anonymous																																

Like the H.323 Extn500 user, User Extn600 also utilized the embedded voicemail. The **Voicemail On** box is checked, and a voicemail password can be configured using the **Voicemail Code** and **Confirm Voicemail Code** parameters.

Select the **Telephony**→ **Call Settings** tab as shown below. Check the **Call Waiting On** box to allow multiple call appearances and transfer operations.

Select the **Telephony**→ **Supervisor Settings** tab as shown below. The **Login Code** will be used by the telephone user as the phone login password.

A new SIP extension may be added by right-clicking on **Extension** in the Navigation pane and selecting **New SIP Extension**. Alternatively, an existing SIP extension may be selected in the group pane. The following screen shows the **Extn** tab for the extension corresponding to an Avaya 1120E.

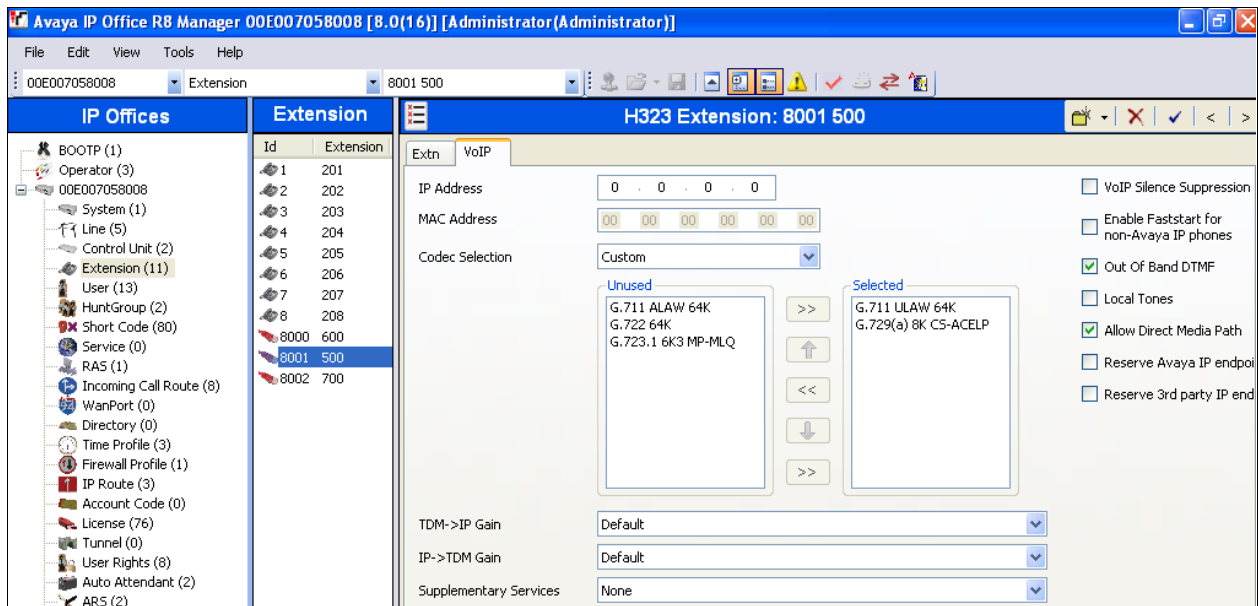

- The **Extension ID** is automatically assigned by IP Office (e.g., **8000**). The **Base Extension** field is manually populated with the desired extension (e.g., **600**).
- Ensure the **Force Authorization** box is checked.

The following screen shows the **VoIP** tab for extension 600.

- The **IP Address** default value is used (**0.0.0.0**).
- Check the **Reserve Avaya IP endpoint license** box.

- In the reference configuration the **Codec Selection** parameter is set to **Custom**, and the same codec list used in **Section 5.3.7** is used.
- Other fields may retain default values.

5.5.3.2 SIP IP Office SoftPhone

Repeat the steps shown in **Section 5.5.3.1** with the following settings.

- **Defining a User**
 - **User tab**
 - The IP Office SoftPhone was provisioned as User **Extn700**.
 - The **Profile** parameter is set to **Power User** (see **Section 5.5.2**).
 - The **Enable Softphone** box is checked, along with other advanced capabilities.
 - **SIP tab**
 - **SIP Name** and **Contact** specifying the user's associated AT&T DNIS number (e.g., **7325554386**).
 - **Voicemail tab**
 - User Extn700 also utilized the embedded voicemail. The **Voicemail On** box is checked, and a voicemail password can be configured using the **Voicemail Code** and **Confirm Voicemail Code** parameters.
 - **Telephony→ Call Settings tab**
 - Check the **Call Waiting On** box to allow multiple call appearances and transfer operations.
 - **Telephony→ Supervisor Settings tab**
 - The **Login Code** is the softphone login password.

- **SIP Extension → VoIP tab for extension 700.**

- The **IP Address** default value is used (**0.0.0.0**).
- In the reference configuration the **Codec Selection** parameter is set to **Custom**, and the same codec list used in **Section 5.3.7** is used.
- Other fields may retain default values.

5.5.4. Hunt Groups

Users may also receive incoming calls as members of a hunt group. To configure a new hunt group, right-click **HuntGroup** from the Navigation pane, and select **New**. To view or edit an existing hunt group, select **HuntGroup** from the Navigation pane, and the appropriate hunt group from the Group pane.

The following screen shows the **Hunt Group** tab for hunt group **4386**. This hunt group was configured to contain the Analog telephone (Extn207), the H.323 telephone (Extn500), and the two SIP telephones Extn600 (1120E) and Extn700 (Softphone). In the reference configuration, these telephones extensions are rung based on idle time, due to the **Ring Mode** setting **LongestWaiting**. Click the **Edit** button to change the **User List** included in the Hunt Group from the list of available users.

The following screen shows the **SIP** tab for hunt group 4386. The **SIP Name** and **Contact** are configured with the AT&T DNIS number **4386** (note that for testing purposes in the reference configuration, AT&T delivered this four digit DNIS number). In **Section 5.7**, an **Incoming Call Route** will map 4386 to this hunt group.

5.6. Short Codes

IP Office provides predefined Short Codes (see **Section 5.9**), however new Short Codes may be defined to match number strings to an action. To add a Short Code, right click on **Short Code** in the Navigation pane, and select **New**. To edit an existing Short Code, click **Short Code** in the Navigation pane, and the Short Code to be configured in the Group pane.

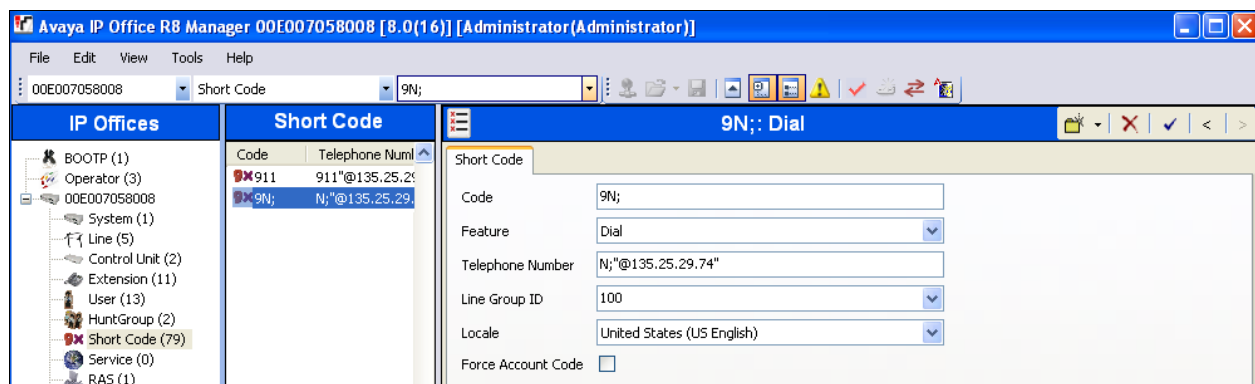

5.6.1. Direct Dialing (no ARS)

In the screen shown below, the Short Code **9N;** is illustrated (note the semicolon at the end of the string). This Short Code will allow an IP Office user to dial the digit 9 followed by any telephone number, symbolized by the letter N, to reach the SIP Line to AT&T. The variable N

can be any number such as a 10-digit number, a 1+10 digit number, a toll free number, directory assistance (e.g., 411), etc.

This Short Code does **not** use the ARS table, and this Short Code does not provide for alternate routing or an awareness of end of user dialing. When a users dial 9 plus the number, IP Office must wait for an end of dialing timeout before sending the SIP INVITE.

- The **Code** parameter is set to **9N;**
- The **Feature** parameter is set to **Dial**
- The **Telephone Number** parameter is set to **N;"@135.25.29.74"** with the text string beginning with **@** in quotes (address 135.25.29.74 is the IP address of the AT&T Business in a Box® over IP Flexible Reach border element). This field is used to construct the Request URI and To Header in the outgoing SIP INVITE message.
- The **Line Group ID** parameter is set to **100**, matching the number of the **Outgoing Group** configured on the **SIP URI** tab of **SIP Line 17** (see **Section 5.4.2**).
- Click the **OK** button (not shown).

5.6.2. Dialing via ARS

In the reference configuration only a single connection existed to the AT&T Business in a Box® over IP Flexible Reach service. Therefore alternate routing via the IP Office ARS capability was not used. However, for completeness, defining an ARS Short Code is described below.

In the screen shown below, the Short Code **8N;** is illustrated (note the semicolon at the end of the string). This simple Short Code will allow an IP Office user to dial the digit 8 followed by any telephone number, symbolized by the letter **N**, to reach the SIP Line to AT&T. However, IP Office will first consult the ARS table defined in **Section 5.8**. The variable **N** can be any number such as a 10-digit number, a 1+10 digit number, a toll free number, directory assistance (e.g., 411), etc.

- The **Code** parameter is set to **8N;**
- The **Feature** parameter is set to **Dial**
- The **Telephone Number** parameter is set to **N**
- The **Line Group ID** parameter is set to **50:Main** (default value provided by IP Office).
- Click the **OK** button (not shown).

Short Code	
Code	8N;
Feature	Dial
Telephone Number	N
Line Group ID	50: Main
Locale	United States (US English)
Force Account Code	<input type="checkbox"/>

5.6.3. Privacy Dialing

Optionally, add or edit a Short Code that can be used to access the SIP Line anonymously. In the screen shown below, the Short Code **3N;** is illustrated. This code is similar to the 9N; code. The **Telephone Number** field begins with the letter **W**, which means “withhold the outgoing calling line identification”.

Note - When a user dials 3 plus the number, IP Office will include the user’s telephone number in the **P-Asserted-Identity** (PAI) header along with the **Privacy: Id** header. The **From** and **Contact** headers will contain **Anonymous**.

- The **Code** parameter is set to **3N;**
- The **Feature** parameter is set to **Dial**
- The **Telephone Number** parameter is set to **WN"@135.25.29.74"**
- The **Line Group ID** parameter is set to **100**, matching the number of the **Outgoing Group** configured on the **SIP URI** tab of **SIP Line 17** (see **Section 5.4.2**).
- Click the **OK** button (not shown).

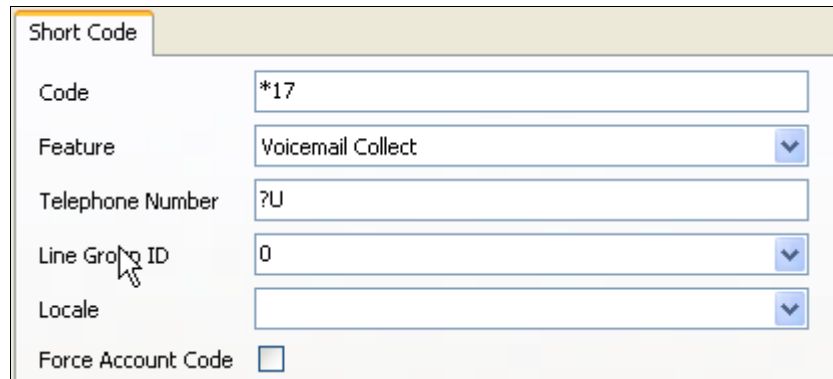

Short Code	
Code	3N;
Feature	Dial
Telephone Number	WN"@135.25.29.74"
Line Group ID	100
Locale	United States (US English)
Force Account Code	<input type="checkbox"/>

5.6.4. Feature Dialing

Optionally, add or edit a Short Code that can be used to access IP Office features rather than a SIP Line.

5.6.4.1 Voicemail Access

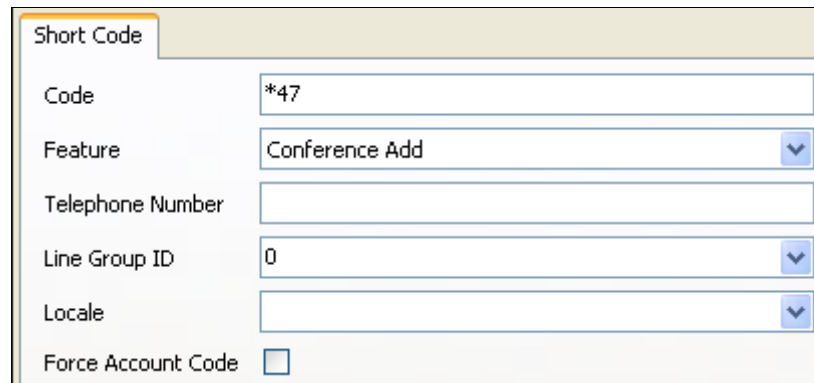

In this case, the **Code *17** is defined for **Feature → Voicemail Collect**. This Short Code will be used as one means to allow an AT&T DNIS number to be programmed to route directly to voice messaging, (via inclusion of this Short Code as the destination of an **Incoming Call Route** in **Section 5.7**).

A screenshot of a web-based configuration form titled "Short Code". The form contains the following fields: "Code" with the value "*17", "Feature" with a dropdown menu showing "Voicemail Collect", "Telephone Number" with the value "?U", "Line Group ID" with a dropdown menu showing "0", "Locale" with a dropdown menu, and "Force Account Code" with an unchecked checkbox.

5.6.4.2 Conference Add Access

In this case, the **Code *47** is defined for **Feature → Conference Add**. Code *47 was used by mobile telephones to create a conference via a DTMF sequence using the IP Office Mobile Call Control feature.

A screenshot of a web-based configuration form titled "Short Code". The form contains the following fields: "Code" with the value "*47", "Feature" with a dropdown menu showing "Conference Add", "Telephone Number" with an empty field, "Line Group ID" with a dropdown menu showing "0", "Locale" with a dropdown menu, and "Force Account Code" with an unchecked checkbox.

5.6.4.3 Feature Name Extension (FNE) Access

Two IP Office Mobility features, **Mobile Call Control** and **Mobile Callback**, are shown as examples of this function.

The following screen illustrates the **Code *97** which is defined for **Feature → FNE Service** and **Telephone Number → 33** for the IP Office Mobility feature **Mobile Callback** (note that 33 is predefined in IP Office for this feature). Code, *97 was used as the destination of an Incoming Call Route for an AT&T DNIS number. This enabled DID calls from a configured twinning destination to be dialed, and then hung up by the caller while hearing ring back. IP Office will then call the caller back using the number defined in the **User → Mobility → Twinned Mobile Number** field (see **Section 5.5.2**), via AT&T Business in a Box® over IP Flexible Reach service.

Note that for this feature to work, the inbound calling number information must match the number provisioned in the associated **User → Mobility → Twinned Mobile Number**. For example, in **Section 5.5.2** the number **917325552438** was defined for the H.323 set. Therefore, the inbound calling number must be **7325552438**.

A screenshot of a web-based configuration form titled "Short Code". The form contains the following fields: "Code" with the value "*97", "Feature" with a dropdown menu showing "FNE Service", "Telephone Number" with the value "33", "Line Group ID" with a dropdown menu showing "0", "Locale" with a dropdown menu, and "Force Account Code" with an unchecked checkbox.

The following screen illustrates another Mobility Short Code. In this case, the **Code *98** is defined for **Feature → FNE Service** and **Telephone Number → 31** for the IP Office Mobility feature **Mobile Call Control** (note that 31 is predefined in IP Office for this feature). Code ***98** was used as the destination of an Incoming Call Route for an AT&T DNIS number. This enabled DID access to Mobile Call Control from configured twinning destinations, allowing the mobile user to make calls as if the calls were made from the user's IP Office extension in the office.

A screenshot of a web-based configuration form titled "Short Code". The form contains the following fields: "Code" with the value "*98", "Feature" with a dropdown menu showing "FNE Service", "Telephone Number" with the value "31", "Line Group ID" with a dropdown menu showing "0", "Locale" with a dropdown menu, and "Force Account Code" with an unchecked checkbox.

5.7. Incoming Call Routes

Each Incoming Call Route will map a specific AT&T DNIS number to a destination user, hunt group, or function on IP Office. To add an incoming call route, right click on **Incoming Call Route** in the Navigation pane, and select **New**. To edit an existing incoming call route, select **Incoming Call Route** in the Navigation pane, and the appropriate incoming call route to be configured in the Group pane.

In the screen shown below, the incoming call route for **Incoming Number → 3145555384** is illustrated.

The **Line Group ID** is set to **100**, matching the **Incoming Group** field configured in the **SIP URI** tab for the SIP Line to AT&T in **Section 5.4.2**.

Line Group ID	Incoming Number	Destination
100	314555385	*98
100	314555386	*97
100	314555384	500 Extn500
100	314555383	208 Extn208
100	7325554385	600 Extn600
100	4386	700 Extn700
100	7325554384	500 Extn500
100	7325554383	208 Extn208

Select the **Destinations** tab. From the **Destination** drop-down, select the extension to receive the call when AT&T delivers DNIS digits 314555384. In the reference configuration DNIS digits 314555384 is associated with IP Office User **Extn500** (the 1608 H.323 telephone).

TimeProfile	Destination	Fallback Extension
Default Value	500 Extn500	
*		

Repeat the process to route all AT&T DNIS numbers to their associated IP Office destinations.

Note that the **Destination** drop down menu may not contain all desired destinations (e.g., Short Codes for feature access as described in **Section 5.6**). In these cases the desired destination may be manually typed into the **Destination** field.

5.8. Automatic Route Selection (ARS) and Alternate Routing

In the reference configuration only a single connection existed to the AT&T Business in a Box® over IP Flexible Reach service. Therefore, alternate routing via the IP Office ARS capability was not used (the direct dial 9N; Short Code described in **Section 5.6.1** was used instead). While detailed coverage of ARS is beyond the scope of these Application Notes, this section includes basic ARS screen illustrations and considerations, including alternate routing should the SIP Line be out of service or temporarily not responding.

ARS can be used rather than the simple 9N; Short Code approach. With ARS, secondary dial tone can be provided after the access code, time-based routing criteria can be introduced, and alternate routing can be specified so that a call can re-route automatically if the primary route or outgoing line group is not available. Although not shown in this section, ARS also facilitates more specific dialed telephone number matching, enabling immediate routing and alternate treatment for different types of numbers following the access code. For example, if all 1+10 digit calls following an access code should use the SIP Line preferentially, but other local or service numbers following the access code should prefer a different outgoing line group, ARS can be used to distinguish the call behaviors.

To add a new ARS route, right-click **ARS** in the Navigation pane, and select **New**. To view or edit an existing ARS route, select **ARS** in the Navigation pane, and select the appropriate route name in the Group pane.

The following screen shows an example ARS configuration for the route **Main** (ARS Route ID 50). The **In Service** parameter refers to the ARS form itself, not the Line Groups that may be referenced in the form. If the **In Service** box is un-checked, calls are routed to the ARS route name specified in the **Out of Service Route** parameter. IP Office Short Codes may also be defined to allow an ARS route to be disabled or enabled from a telephone. The configurable provisioning of an Out of Service Route, and the means to manually activate the Out of Service Route, can be helpful for scheduled maintenance or other known service-affecting events for the primary route.

XXXXXXXXXN	N"@135.25.29.74"	Dial 3K1	100

Alternate Route Priority Level: 3

Alternate Route Wait Time: 30 Alternate Route: 51: Backup

Assuming the primary route is in-service, the number passed from the Short Code used to access ARS (e.g., 8N; in **Section 5.6.2**) can be further analyzed to direct the call to a specific Line Group ID. Per the example screen above, if the user dialed 8-1-732-555-2438, the call would be directed to Line Group 100. If Line Group 100 cannot be used, the call can automatically route to the route name configured in the **Additional Route** parameter in the lower right of the screen (**Backup**).

Since alternate routing can be considered a privilege not available to all callers, IP Office can control access to the alternate route by comparing the calling user's priority to the value in the **Alternate Route Priority Level** field.

Note – No alternate network access was available in the reference configuration. The example below is included for informational purposes.

The following screen shows an example ARS configuration for the route named **Backup** (ARS Route ID 51). If the user dialed 8-1-732-555-2438, and the call could not be routed via the primary route **Main** described above, the call will be delivered to this **Backup** route. Per the configuration shown below, the call would be delivered to Line Group **4** (e.g., an additional SIP Line used for backup purposes). The configuration of the **Code**, **Telephone Number**, **Feature**, and **Line Group ID** for an ARS route is similar to the configuration already shown for Short Codes in **Section 5.6**.

The screenshot displays the Avaya IP Office R8 Manager interface. The left-hand pane shows the system configuration tree, with 'ARS' selected. The main pane shows the configuration for the 'Backup' route (Route ID 51). The configuration includes fields for 'ARS Route Id', 'Route Name', 'Dial Delay Time', 'In Service', 'Time Profile', 'Out of Service Route', 'Out of Hours Route', 'Alternate Route Priority Level', 'Alternate Route Wait Time', and 'Alternate Route'. A table below these fields defines the ARS entries.

Code	Telephone Number	Feature	Line Group ID
11	911	Dial Emergency	4
911	911"@135.25.29.74"	Dial Emergency	4
0N;	0N	Dial 3K1	4
1N;	1N"@135.25.29.74"	Dial	4
XN;	N	Dial 3K1	4
XXXXXXXXXXN	N	Dial 3K1	4

If a primary route experiences a network outage such that no response is received to an outbound INVITE, IP Office routes the call via the backup route. The user receives an audible tone when the re-routing occurs and may briefly see “Waiting for Line” on the display. The redirection will occur if a call is made right after a failure of the primary route, so IP Office had not yet marked the SIP Line out of service as a result of no response to SIP OPTIONS (see the note in **Section 5.3.3**). Alternatively calls can be delivered via the alternate route when the primary route was manually marked out-of-service, or known to be out-of-service due to prior failure of SIP OPTIONS.

5.9. Auto Attendant (via Embedded Voice Mail)

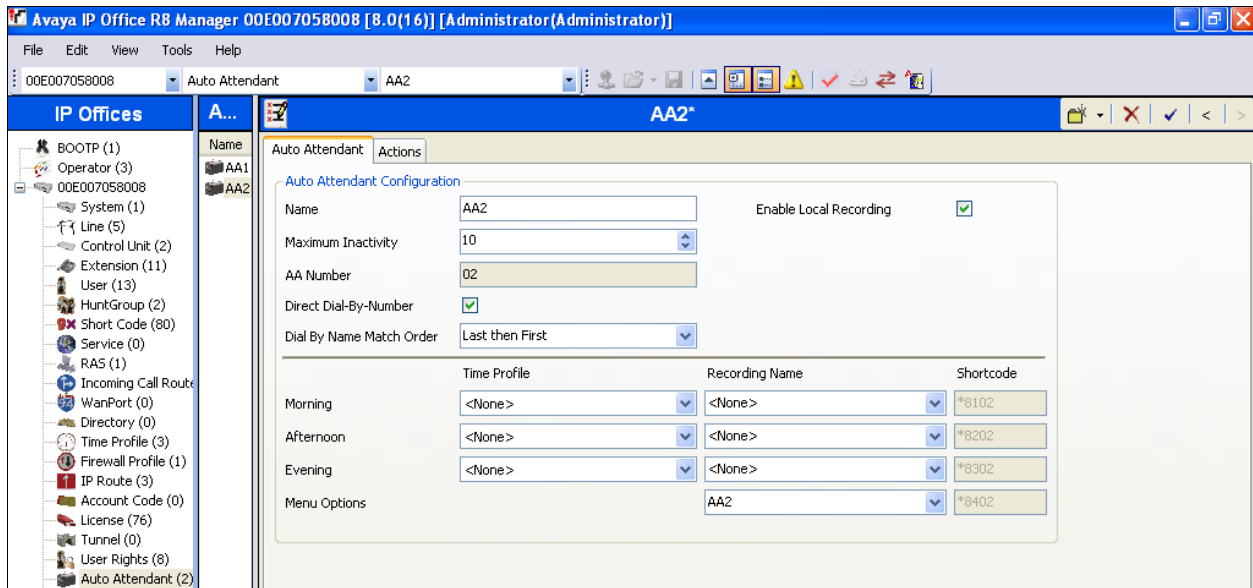

The IP Office embedded voice mail provides for basic Auto Attendant functionality. In the reference configuration an Auto Attendant was provisioned to prompt callers to enter the IP Office extension they wished to connect to. This is accomplished via the following steps:

- Create an Auto Attendant, and define Actions.
- Record an announcement via a predefined Short Code associated with the Auto Attendant.
- Route incoming calls to the Auto Attendant.

To add a new Auto Attendant, right-click **Auto Attendant** in the Navigation pane, and select **New**. To view or edit an existing Auto Attendant, select **Auto Attendant** in the Navigation pane, and select the appropriate Auto Attendant name in the Group pane. In the reference configuration, Auto Attendant **AA2** is added.

1. Create Auto Attendant.

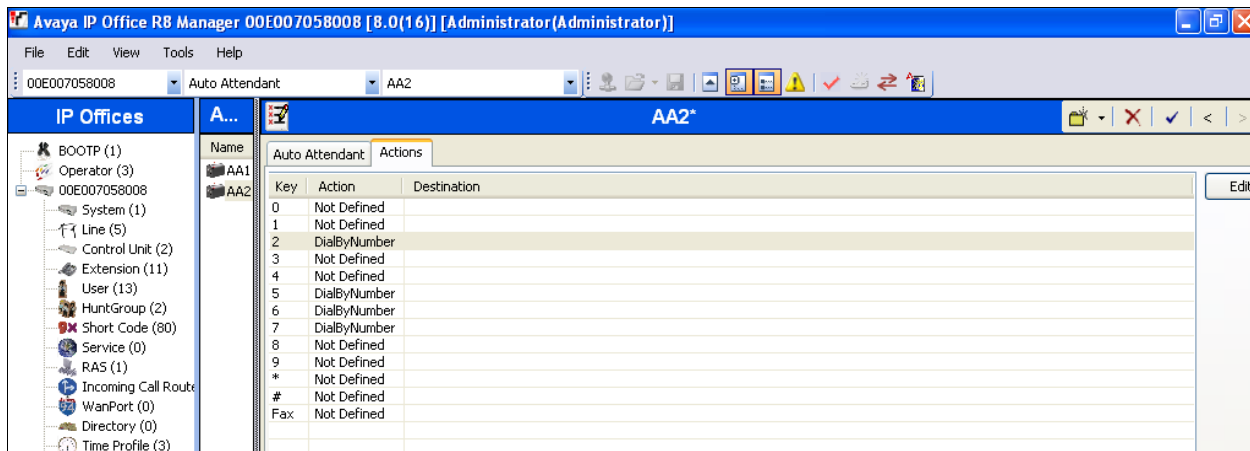

- On the **Auto Attendant** tab:
 - Enter a **Name** (e.g., **AA2**).
 - Check the **Direct Dial-By-Number** and **Enable Local Recording** boxes.
 - In the **Recording Name** column, and in the **Menu Options** row, select **AA2**. Note that pre-defined Short Code ***8402** is associated with this row. This short code may be dialed by an IP Office extension, to record this Auto Attendant announcement.
 - Let all other fields default.

- On the **Actions** tab, the **Key** column represents the possible leading digit of the defined extensions on IP Office. The **Action** column defines what functions are applied to the Key. In the reference configuration, extensions beginning with 2, 5, 6, and 7 are provisioned.
 - Select a Key representing a provisioned extension (e.g., **2**), and click on the **Edit** button (or double click the row). The **Edit Action** window will open.
 - Select **DialByNumber** from the **Action** drop-down menu.
 - Select **OK**.

- Repeat for all remaining applicable Keys (e.g., **5**, **6** and **7**).
- Click **OK**

2. Record an announcement.
 - From an IP Office extension, dial ***8402** and follow the prompts to record and save the announcement (e.g., “Please enter the extension.”).
3. Route an incoming call to the Auto Attendant.
 - Following the procedures described in **Section 5.7**, route the associated AT&T DNIS number (e.g., **3145555383**) to the **Destination** drop down menu selection **AA:AA2**.
 Note – The AT&T DNIS number defined here must also be provisioned in the SIP Line → SIP URI tab (see **Section 5.4.2**).
 - Click **OK** (not shown).

When the associated AT&T Business in a Box® over IP Flexible Reach number is called from PSTN, the caller will be prompted to enter an IP Office extension (e.g., 600).

5.10. Privacy / Anonymous Calls

As described in **Section 5.6**, an IP Office user whose calling line identification is not typically withheld from the network can request privacy in the sample configuration by dialing the Short Code **3N**; to access the SIP Line. The Avaya 1600-Series IP Telephones can also request privacy for a specific call, without dialing a unique Short Code, using **Features → Call Settings → Withhold Number**, on the phone itself. Specific users may be configured to always withhold calling line identification by checking the **Anonymous** field in the **SIP** tab for the user (see **Section 5.5.3**).

5.11. SIP Options Frequency

In the sample configuration, IP Office periodically checks the health of the SIP Line by sending a SIP OPTIONS message. If there is no response, IP Office can mark the trunk out of service. Although ARS (as shown in **Section 5.8**) can include alternate routes to complete calls even if the far-end is not responding, IP Office must wait for the outbound INVITE to timeout before route advance. Once the SIP OPTIONS maintenance recognizes that the SIP Line is out-of-service, new calls will no longer be delayed before route advance. Also, once the problem with the SIP Line is resolved, the SIP OPTIONS maintenance will automatically bring the link back to the in-service state. In addition, for secure networks, the periodic sending of OPTIONS by IP Office may serve to keep network Firewall “pinholes” open preventing the blockage of inbound traffic to IP Office.

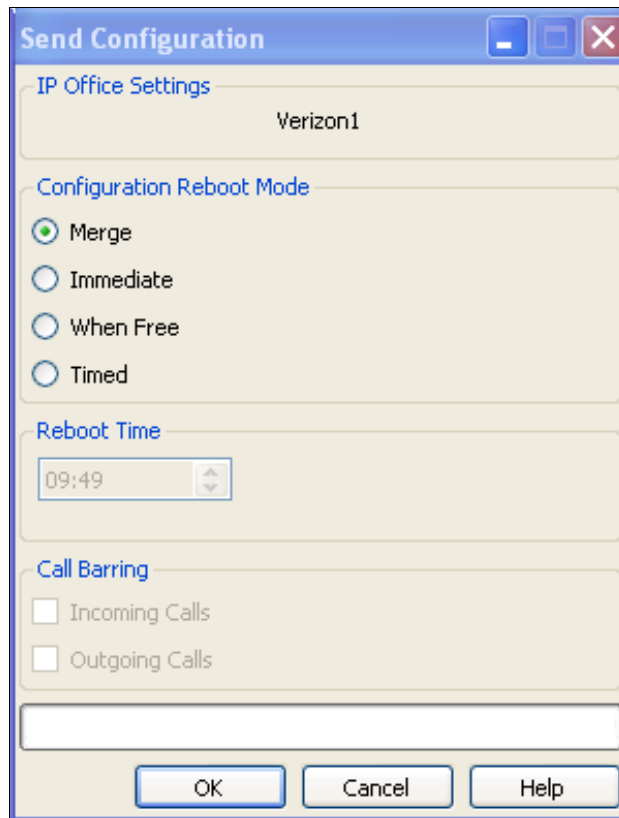

In the reference configuration, IP Office sourced SIP OPTIONS every 60 seconds, (the value configured in the Binding Refresh Time provisioned in **Section 5.3.3**).

Note – In the reference configuration IP Office sent OPTIONS to the AT&T Business in a Box® over IP Flexible Reach service Border Element and AT&T responded with *405 Method Not Allowed* (which is the expected response). That response is sufficient for IP Office to consider the connection up. The AT&T Business in a Box® over IP Flexible Reach service Border Element does *not* send OPTIONS to IP Office.

5.12. Saving Configuration Changes to IP Office

The provisioning changes made in IP Office Manager must be applied to the IP Office server in order for the changes to take effect. At the top of the IP Office Manager page click **File → Save Configuration** (if that option is grayed out, no changes are pending).

A screen similar to the following will appear, with either **Merge** or **Immediate** selected, based on the nature of the configuration changes made since the last save. Selecting **Immediate** will cause the IP Office server to reboot. Click **OK** to execute the save.

The active configuration may be saved to a file at any time by selecting **File → Save Configuration As**.

6. AT&T Business in a Box® over IP Flexible Reach Configuration

AT&T provided the Business in a Box® over IP Flexible Reach service border element IP address, the access DID numbers and the associated DNIS digits used in the reference configuration. AT&T required that the IP Office LAN2 IP address be provided to the Business in a Box® over IP Flexible Reach service.

7. Verification Steps

The following procedures may be used to verify the IP Office R8 with AT&T Business in a Box® over IP Flexible Reach service configuration.

7.1. General

The following items may be used to verify IP Office functionality with the AT&T Business in a Box® over IP Flexible Reach service:

- Incoming calls from the PSTN routed by the AT&T Business in a Box® over IP Flexible Reach service to the Avaya IP Office location. These incoming PSTN calls arrive via the SIP Line and may be answered by Avaya SIP telephones/Softphones, H.323 telephones, Analog telephones, Analog fax machines or via Hunt Groups. Coverage to Avaya IP Office Embedded Voicemail and auto-attendant applications may also be used. The display of caller ID on display-equipped Avaya IP Office telephones can be verified.
- Outgoing calls from the Avaya IP Office location to the PSTN routed via the SIP Line to the AT&T Business in a Box® over IP Flexible Reach service. These outgoing PSTN calls can be originated from Avaya SIP telephones/Softphones, H.323 telephones, or Analog endpoints. The display of caller ID on display-equipped PSTN telephones may be verified.
- Inbound / Outbound fax using T38.
- Proper disconnect when the caller abandoned a call before answer for both inbound and outbound calls, and when the IP Office party or the PSTN party terminated an active call.
- Proper busy tone heard when an IP Office user called a busy PSTN user, or a PSTN user called a busy IP Office user (i.e., if no redirection was configured for user busy conditions).
- Various outbound PSTN call types were tested including long distance, international, and toll-free.
- Requests for privacy (i.e., caller anonymity) for IP Office outbound calls to the PSTN.
- Privacy requests for inbound calls from the PSTN to IP Office users.
- SIP OPTIONS monitoring of the health of the SIP trunk. In the reference configuration IP Office sent OPTIONS to the AT&T Business in a Box® over IP Flexible Reach service Border Element and AT&T responded with *405 Method Not Allowed* (which is the expected response). That response is sufficient for IP Office to consider the connection up. The AT&T Business in a Box® over IP Flexible Reach service Border Element does **not** send OPTIONS to IP Office.
- Incoming and outgoing calls using the G.729(a) and G.711 ULAW codecs.
- DTMF transmission (RFC 2833) for successful voice mail navigation using G.729a and G.711MU for incoming and outgoing calls, including navigation of a simple auto-attendant application configured on IP Office Embedded Voicemail.
- Telephony features such as call waiting, hold, transfer, and conference.

- Mobile twinning to a mobile phone when the associated IP Office extension is called, as well as Mobility features such as Mobile Callback and Mobile Call Control may also be verified.

7.2. Analysis/Troubleshooting

The following items may be used to analyze/troubleshoot IP Office operations.

7.2.1. System Status Application

The System Status application can be used to monitor or troubleshoot IP Office. The System Status application can typically be accessed from **Start → Programs → IP Office → System Status**. The following screen shows an example **Logon** screen. Enter the IP Office IP address in the **Control Unit IP Address** field, and enter an appropriate **User Name** and **Password**. Click **Logon**.

After logging in, select **Trunks → Line: 17** from the left navigation menu. (SIP Line 17 is configured in **Section 5.4** to communicate with the AT&T Business in a Box® over IP Flexible Reach service). A screen such as the one shown below is displayed. In the lower left, the **Trace All** button may be pressed to display tracing information as calls are made using this SIP Line.

7.2.2. System Monitor Application

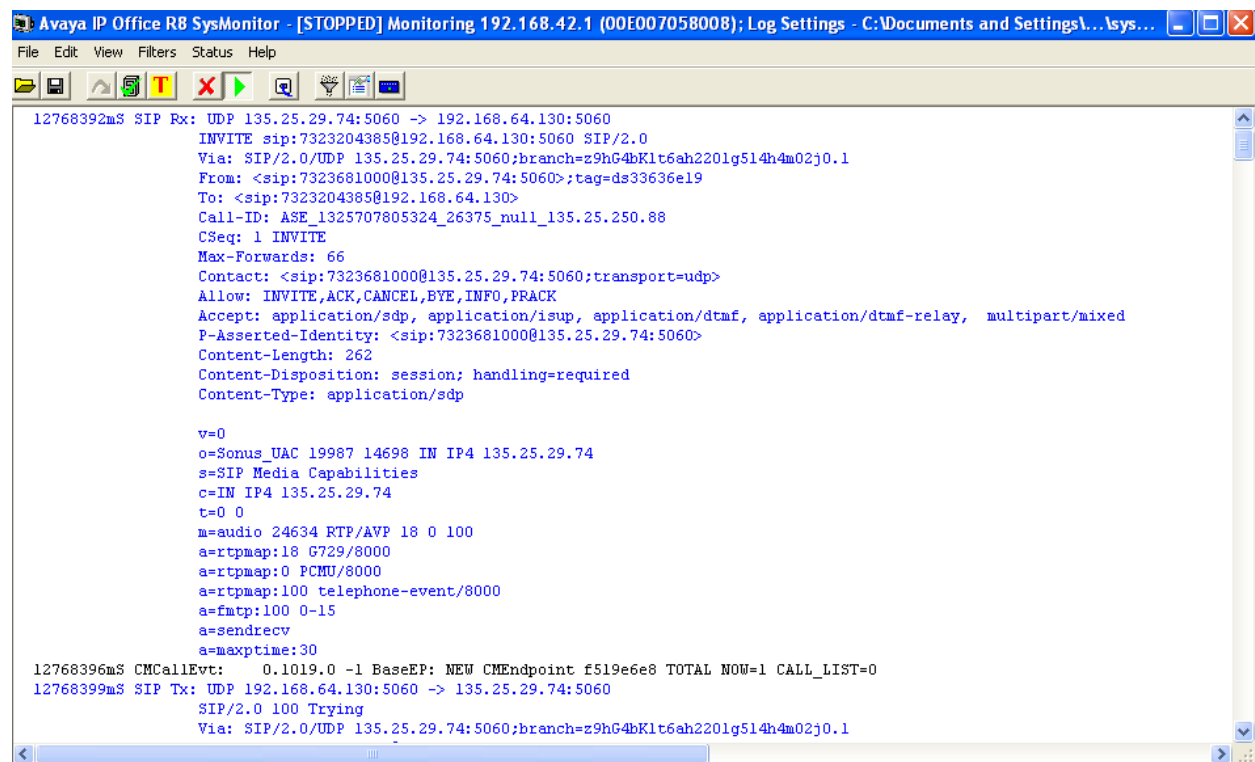

The System Monitor application can also be used to monitor or troubleshoot. The System Monitor application can typically be accessed from **Start → Programs → IP Office → Monitor**.

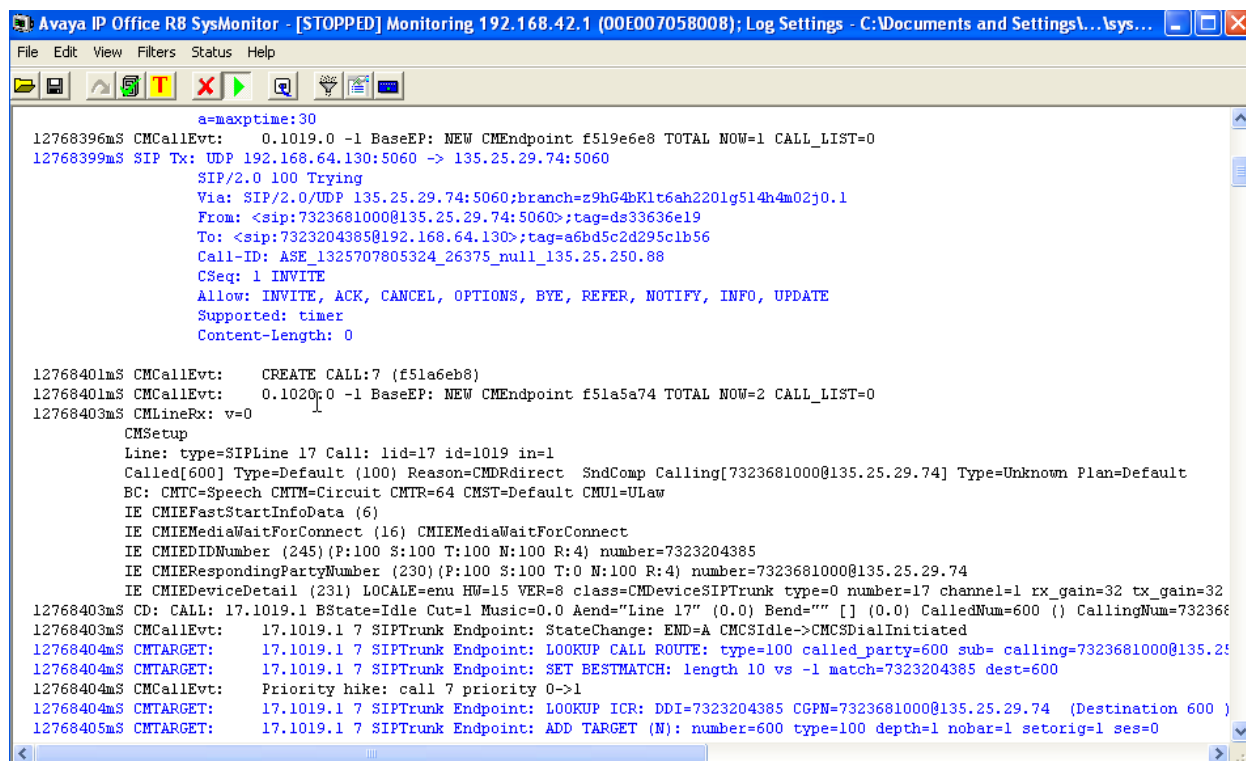

The Monitor will be active at startup. To pause the Monitor press the Pause  button.

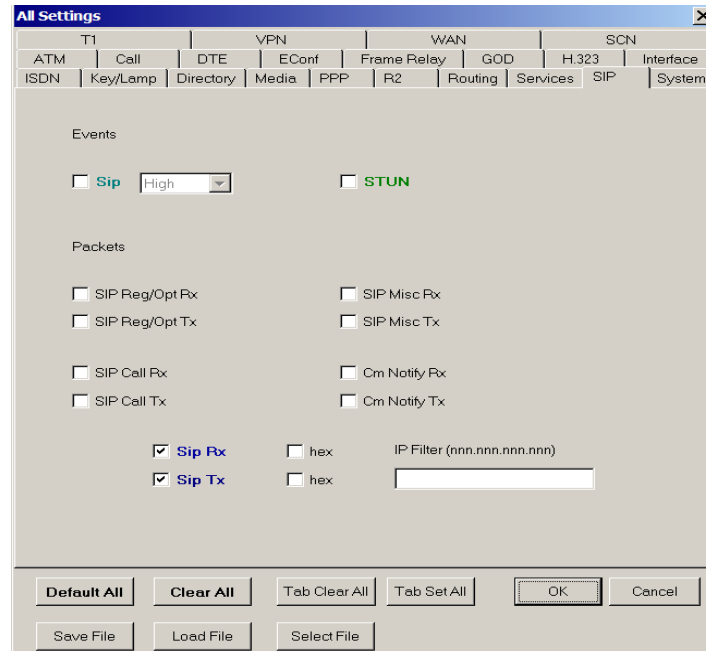

The pause button will be replaced with the Start  button. Press this button to resume the monitoring. To clear the Monitor display, press the Clear  button.

Below are samples of a monitored inbound call to IP Office SIP telephone Extn600. The Monitor will display SIP protocol (first image) as well as internal IP Office processing (second image).

The Monitor application allows the monitored information to be customized. To customize, select the Options button  that is third from the right in the screen above, or select **Filters** → **Trace Options**. The following screen shows the **SIP** tab, allowing configuration of SIP monitoring. In this example, the **SIP Rx** and **SIP Tx** boxes are checked. All SIP messages will appear in the trace with the color blue. To customize the color, right-click on **SIP Rx** or **SIP Tx** and select the desired color.

8. Conclusion

As illustrated in these Application Notes, Avaya IP Office Release 8.0 can be configured to interoperate successfully with the AT&T Business in a Box® over IP Flexible Reach service. This solution provides users of Avaya IP Office the ability to support inbound and outbound calls over an AT&T Business in a Box® over IP Flexible Reach SIP trunk service connection via MIS/PNT transport. Additionally the ability of Avaya IP Office to provide SIP Diversion Header to the AT&T Business in a Box® over IP Flexible Reach service for certain outbound call scenarios was demonstrated, as were the other capabilities listed in **Section 2**. The reference configuration shown in these Application Notes is representative of a basic enterprise customer configuration and is intended to provide configuration guidance to supplement other Avaya product documentation. It is based upon formal interoperability compliance testing as part of the Avaya DevConnect Service Provider program.
