# **Application Notes for Avaya Aura<sup>®</sup> Communication Manager 6.0.1, Avaya Aura<sup>®</sup> Session Manager 6.1, with COLT VoIP Access SIP Service – Issue 1.0**

## **Abstract**

These Application Notes illustrate a sample configuration using Avaya Aura<sup>®</sup> Session Manager Release 6.1, Avaya Aura<sup>®</sup> Communication Manager Release 6.0.1, and the Acme Packet 3820 Session Border Controller release 6.1.0 with the COLT VoIP Access SIP Service.

The COLT VoIP Access SIP Service offer referenced within these Application Notes is designed for business customers with an Avaya SIP trunk solution. The service provides local and/or long distance PSTN calling via standards-based SIP trunks directly, without the need for additional TDM enterprise gateways or TDM cards and the associated maintenance costs.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab., utilizing a COLT VoIP Access SIP circuit connection to the production COLT VoIP Access SIP Service.

# 1. Introduction

These Application Notes illustrate a sample configuration using Avaya Aura<sup>®</sup> Session Manager Release 6.1, Avaya Aura<sup>®</sup> Communication Manager Release 6.0.1, and the Acme Packet 3820 Session Border Controller (SBC) release 6.1.0 with the COLT VoIP Access SIP Service. The COLT VoIP Access SIP Service provides local and/or long-distance calls (with PSTN endpoints) via standards-based SIP trunks.

## 1.1. Interoperability Compliance Testing

Compliance testing scenarios for the configuration described in these Application Notes included the following:

- Inbound and outbound voice calls between telephones controlled by Avaya Aura<sup>®</sup> Communication Manager and the PSTN can be made using G.711A or G.729A codecs.
- Direct IP-to-IP Media (also known as “Shuffling”) when applicable.
- DTMF using RFC 2833
  - Outbound call to PSTN application requiring post-answer DTMF (e.g., an IVR or voice mail system)
  - Inbound call from PSTN to Avaya CPE application requiring post-answer DTMF (Avaya vector digit collection steps)
- Hold / Retrieve with music on hold
- Call transfer.
- Conference calls
- SIP Diversion Header for call redirection
  - Call Forwarding
  - EC500
- Long hold time calls
- Inbound/outbound Fax using T.38

## 1.2. Support

### 1.2.1 Avaya

For technical support on the Avaya products described in these Application Notes visit <http://support.avaya.com>

### 1.2.2 COLT

Telephone support is available on a national basis as shown in the following table, which shows the hotline number for each country where support is available, as well as a toll-free number if available.

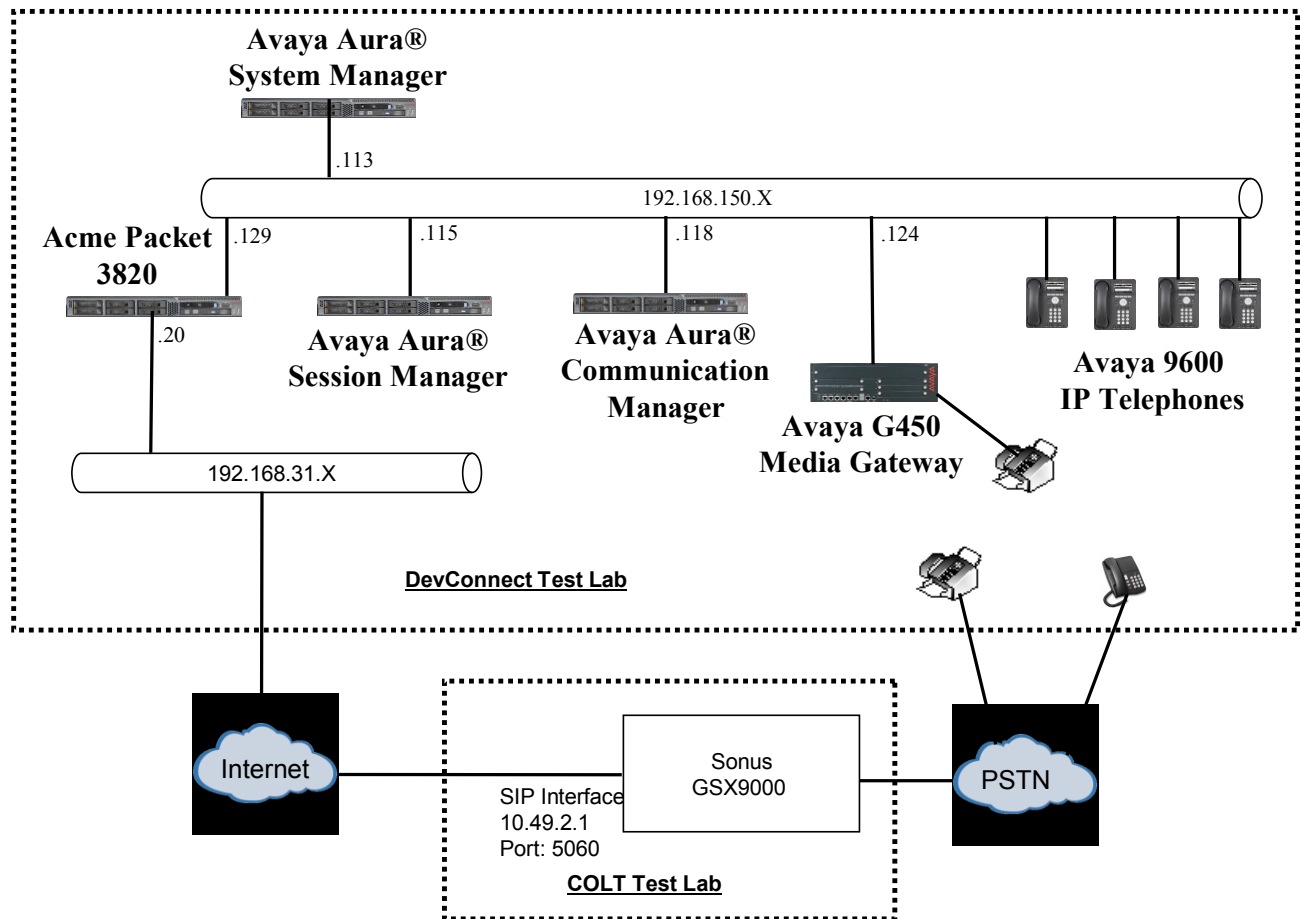

| Country     | Hot Line            | Toll-Free     |
|-------------|---------------------|---------------|
| Austria     | (+43) 1 20 500 500  | 0800 880 990  |
| Belgium     | (+32) 2 790 16 29   | 0800 50701    |
| Switzerland | (+41 ) 44 560 0720  | 0800 560 560  |
| Denmark     | (+45) 70 27 35 59   |               |
| France      | (+33) 1 70995600    | 0800 948 888  |
| Germany     | (+49) 69 56606 3115 | 0800 855 4444 |
| Ireland     | (+34) 9355 02568    | 1800 944040   |
| Italy       | (+39) 0230 329 550  | 0800 909 377  |
| Netherlands | (+31 ) 20 888 2433  | 0800 265 8023 |
| Portugal    | (+351) 211 200 222  | 808 780 222   |
| Spain       | (+34) 913 206018    | 901 888400    |
| Sweden      | (+46) 8781 8333     |               |
| UK          | (+44) 203 140 2023  | 0800 136 166  |

### **1.3. Known Limitations**

No limitations were found during testing

## 2. Reference Configuration

**Figure 1** shows the sample configuration. As shown in **Figure 1**, the Acme Packet 3820 SBC receives traffic from the COLT VoIP Access SIP Service. The COLT VoIP Access SIP Service provided Direct Inward Dial (DID) 10 digit numbers. These DID numbers were mapped by Avaya Aura® Communication Manager to Avaya telephone four-digit extensions by deletion of all but the four trailing digits.

**Figure 1: Avaya Interoperability Test Lab Configuration**

The following components were used in the sample configuration:

- Sonux GSX
- Acme Packet 3820 Session Border Controller (SBC)
- Avaya Aura® Communication Manager Release 6
- Avaya Aura® Session Manager Release 6
- Avaya Aura® System Manager Release 6
- Avaya G450 Media Gateway
- Avaya 9600 Series IP telephones using the H.323 software bundle
- Avaya 9600 Series IP telephones using the SIP software bundle

Some components described within this document use network names defined by a DNS server at address 192.168.200.2 (not shown in above diagram). This server defines the following DNS names used within the “inside” network used within this document:

| Item                          | Hostname            | IP Addr         |
|-------------------------------|---------------------|-----------------|
| System Manager domain0        | smgrdom0.aura.dcffm | 192.168.150.111 |
| System Manager console        | smgrcon.aura.dcffm  | 192.168.150.112 |
| System Manager server         | smgr.aura.dcffm     | 192.168.150.113 |
| Session Manager server        | sm.aura.dcffm       | 192.168.150.114 |
| Session Manager asset         | asset.aura.dcffm    | 192.168.150.115 |
| Communication Manager domain0 | cm1dom0.aura.dcffm  | 192.168.150.116 |
| Communication Manager console | cm1con.aura.dcffm   | 192.168.150.117 |
| Communication Manager server  | cm1.aura.dcffm      | 192.168.150.118 |
| G450 Media gateway            | cm1gw.aura.dcffm    | 192.168.150.124 |
| Acme 3820 SBC                 | sbc.aura.dcffm      | 192.168.150.129 |

**Note** – These Application Notes describe the provisioning used for the sample configuration shown in **Figure 1**. Other configurations may require modifications to the provisioning described in this document.

## 2.1. History Info and Diversion Headers

The COLT VoIP Access SIP Service does not support SIP History Info Headers. Instead, the COLT VoIP Access SIP Service requires that SIP Diversion Header be sent for redirected calls. The Avaya Aura® Communication Manager SIP trunk group form provides options for specifying whether History Info Headers or Diversion Headers are sent.

The Avaya Aura® Communication Manager call forwarding or Extension to Cellular (EC500) features may be used for call scenarios testing Diversion Header.

### 3. Equipment and Software Validated

The following Avaya components were used run on Avaya S8800 servers.

| Software                                      | System Platform | Template                                |
|---|-----------------|---|
| Avaya Aura <sup>®</sup> Communication Manager | 6.0.2.0.5       | 6.1.0.0.2350<br>Patch: 00.1.510.1-18621 |
| Avaya Aura <sup>®</sup> Session Manager       | N/A             | 6.1.0.0.610023                          |
| Avaya Aura <sup>®</sup> System Manager        | 6.0.2.0.5       | 6.1.4.0 + SP0.r873                      |

**Table 1: Equipment and Software Used in the Sample Configuration**

The following equipment and software were used in the sample configuration.

| Equipment                                  | Version                                       |
|--|---|
| Avaya G450 Media Gateway                   | 31.17.1                                       |
| Avaya 9600-Series Telephones (H.323)       | 3.1.1   |
| Avaya 9600-Series Telephones (SIP)         | 2.6.4   |
| Acme Packet 3820 Session Border Controller | Firmware SCX6.1.0 MR-4<br>Patch 2 (Build 682) |
| Sonus PSX                                  | 7.3.3F6                                       |
| Sonus GSX                                  | 7.3.3R1                                       |
| Sonus DSI                                  | 7.3.3R1                                       |
| Sonus EMS                                  | 7.3.3R2                                       |

**Table 1: Equipment and Software Used in the Sample Configuration**

## 4. Avaya Aura<sup>®</sup> Communication Manager Configuration

### 4.1. Verify Licensed Features

The Communication Manager license file controls customer capabilities. Contact an authorized Avaya representative for assistance if a required feature needs to be enabled.

On **Page 2** of the *display system-parameters customer-options* form, verify that the **Maximum Administered SIP Trunks** is sufficient for the combination of trunks to the COLT VoIP Access SIP Service offer and any other SIP applications. Each call from a non-SIP endpoint to the COLT VoIP Access SIP Service uses one SIP trunk for the duration of the call.

| display system-parameters customer-options              |  | Page         | 2 of 11   |
|---|--|--------------|-----------|
| OPTIONAL FEATURES                                       |  |              |           |
| IP PORT CAPACITIES                                      |  | USED         |           |
| Maximum Administered H.323 Trunks:                      |  | 12000        | 0         |
| Maximum Concurrently Registered IP Stations:            |  | 18000        | 0         |
| Maximum Administered Remote Office Trunks:              |  | 12000        | 0         |
| Maximum Concurrently Registered Remote Office Stations: |  | 18000        | 0         |
| Maximum Concurrently Registered IP eCons:               |  | 414          | 0         |
| Max Concur Registered Unauthenticated H.323 Stations:   |  | 100          | 0         |

## 4.2. Dial Plan

In the sample configuration the Avaya CPE environment uses four digit local extensions, such as 2xxx. Trunk Access Codes (TAC) are 4 digits in length and begin with \*8. The Feature Access Code (FAC) to access ARS is the single digit 0. The dial plan illustrated here is not intended to be prescriptive; any valid dial plan may be used.

The dial plan is modified with the *change dialplan analysis* command.

| change dialplan analysis |              |           |               |              |           | Page 1 of 12    |              |           |

| *9                       | 2            | dac       |               |              |           |                 |              |           |

### 4.3. Node Names

Node names are mappings of names to IP Addresses that can be used in various screens. The following abridged “change node-names ip” output shows relevant node-names in the sample configuration. As shown in bold, the node name for Session Manager is “asset” with IP Address 192.168.150.115. The node name and IP Address (192.168.150.118) for the Processor Ethernet “procr” appears automatically due to the web configuration in Section 4.1.

| change node-names ip |                        | Page 1 of 2 |
|----------------------|------------------------|-------------|
| IP NODE NAMES        |                        |             |
| Name                 | IP Address             |             |
| <b>asset</b>         | <b>192.168.150.115</b> |             |
| default              | 0.0.0.0                |             |
| <b>procr</b>         | <b>192.168.150.118</b> |             |
| procr6               | ::                     |             |

### 4.4. IP Interface for procr

The “add ip-interface procr” or “change ip-interface procr” command can be used to configure the Processor Ethernet (PE) parameters. The following screen shows the parameters used in the sample configuration. While the focus here is the use of the PE for SIP Trunk Signaling, observe that the Processor Ethernet will also be used for registrations from H.323 IP Telephones and H.248 gateways in the sample configuration.

| change ip-interface procr  |                                 | Page 1 of 2 |
|----------------------------|---------------------------------|-------------|
| IP INTERFACES              |                                 |             |
| Type: PROCR                | Target socket load: 19660       |             |

| Node Name: procr           | IP Address: 192.168.150.118     |             |
| Subnet Mask: /24           |                                 |             |

## 4.5. Network Regions for Gateway, Telephones

Network regions provide a means to logically group resources. In the shared Communication Manager configuration used for the testing, the Avaya G450 Media Gateway is in region 1. The MM711 Analog interface serves as an interface to the Fax device.

|                        |                       |         |             |                          |   |
|------------------------|-----------------------|---------|-------------|--------------------------|---|
| change media-gateway 1 |                       |         | Page 2 of 2 |                          |   |

## 4.6. IP Codec Sets

The following screen shows the configuration for codec set to be used for local and external calls. In general, an IP codec set is a list of allowable codecs in priority order.

|                       |             |         |           |             |

## 4.7. SIP Signaling Groups

This section illustrates the configuration of the SIP Signaling Groups that use the Processor Ethernet. Each signaling group has a **Group Type** of “sip”, a **Near-end Node Name** of “procr”, and a **Far-end Node Name** of “asset”. In the example screens, the **Transport Method** for all signaling groups is “tcp”. In production, TLS transport between Communication Manager and Session Manager may be used. The **Enable Layer 3 Test** field is enabled to allow Communication Manager to maintain the signaling group using the SIP OPTIONS method. Fields that are not referenced in the text below can be left at default values, including **DTMF over IP** set to “rtp-payload”, which corresponds to RFC 2833.

```

change signaling-group 1                                     Page 1 of 1
                                SIGNALING GROUP

```

## 4.8. SIP Trunk Group

This section illustrates the configuration of the SIP Trunks Groups corresponding to the SIP signaling groups from the previous section.

The following shows **Page 1** for trunk group 1, which will be used for PSTN calls to and from COLT. The **Number of Members** field defines how many simultaneous calls are permitted for the trunk group. The **Service Type** field should be set to “public-ntwrk” for the trunks that will handle calls with COLT.

```

add change trunk-group 1                                     Page 1 of 21
                                TRUNK GROUP

|                                  | Maintenance Tests? y             |
| <b>Numbering Format: private</b> |                                  |
|                                  | UUI Treatment: service-provider  |
|                                  | Replace Restricted Numbers? n    |
|                                  | Replace Unavailable Numbers? n   |
|                                  | Modify Tandem Calling Number: no |
| Show ANSWERED BY on Display? y   |                                  |

The following shows **Page 4** for trunk group 1. The **PROTOCOL VARIATIONS** page is one reason why it can be advantageous to configure incoming calls from COLT to arrive on specific signaling groups and trunk groups. Although not strictly necessary, the **Telephone Event Payload Type** has been set to 101 to match COLT configuration. In the testing associated with these Application Notes, transfer testing using INVITE was successfully completed with the **Network Call Redirection** flag set to default value “n”.

For redirected calls, COLT supports the Diversion header, but not the History-Info header. Communication Manager can send only the Diversion header by marking **Send Diversion Header** to “y” and **Support Request History** to “n”.

```
add trunk-group 1
```

Page 4 of 21

```

```
Convert 180 to 183 for Early Media? n
Always Use re-INVITE for Display Updates? n
Identity for Calling Party Display: P-Asserted-Identity
Enable Q-SIP? n
```

## 4.9. Route Pattern Directing Outbound Calls to COLT

Route pattern 1 will be used for calls destined for the PSTN via the COLT VoIP Access SIP Service. Digit manipulation can be performed on the called number, if needed, using the **No. Del Dgts** and **Inserted Digits** parameters. Digit manipulation can also be performed by Session Manager.

If desired, one or more alternate Communication Manager trunks can be listed in the route pattern so that the Look-Ahead Routing (LAR) “next” setting can route-advance to attempt to compete the call using alternate trunks should there be no response or an error response from the far-end. Examples are provided in references [PE] and [LAR]. The **Numbering Format** should be set to **unk-unk**.

```
change route-pattern 1
```

Page 1 of 3

## 4.10. Public Numbering

The “change public-unknown-numbering” command may be used to define the format of numbers sent to COLT in SIP headers such as the “From” and “PAI” headers. In general, the mappings of internal extensions to COLT DID numbers may be done in Session Manager (via Digit Conversion in adaptations) or in Communication Manager (via public-unknown-numbering, and incoming call handling treatment for the inbound trunk group).

In the bolded rows shown in the example abridged output below, all Communication Manager extensions are mapped to a DID numbers by adding the sequence 44111111 to the beginning of the number, when the call uses trunk group 1. Alternatively, Communication Manager can send the extension to Session Manager by leaving the **CPN Prefix** field blank and setting the **CPN Len** to 4 (i.e., similar to the first row in the screen), and Session Manager can adapt the number to the COLT DID.

|                                   |          |          |                 |           |                              |
|-----------------------------------|----------|----------|-----------------|-----------|------------------------------|
| change public-unknown-numbering 4 |          |          |                 |           | Page 1 of 2                  |

## 4.11. ARS Routing For Outbound Calls

Although not illustrated in these Application Notes, location-based routing may be configured so that users at different locations that dial the same telephone number can have calls choose different route-patterns. Various example scenarios for a multi-location network with failover routing are provided in reference [PE]. In these Application Notes, the ARS “all locations” table directs ARS calls to specific SIP Trunks to Session Manager. Appropriate ARS entries can be added to match the various dial patterns (e.g., long distance, service numbers, etc.) to be sent to COLT.

The following screen shows a sample specific ARS configuration for a number that will be dialed in the Verification section of these Application Notes. If a user dials the ARS access code defined in **Section 4.2**, followed by the number beginning with “0” with a length between 7 and 15 digits, the call will select route pattern 1.

|                          |        |             |          |      |      |      |  |                 |
|--------------------------|--------|-------------|----------|------|------|------|--|-----------------|

## 4.12. Incoming Call Handling Treatment for Incoming Calls

In general, the “incoming call handling treatment” for a trunk group can be used to manipulate the digits received for an incoming call if necessary. Since Session Manager is present, Session Manager can be used to perform digit conversion, and digit manipulation via the Communication Manager incoming call handling table may not be necessary. If the DID number sent by COLT is unchanged by Session Manager, then the DID number can be mapped to an extension using the incoming call handling treatment of the receiving trunk group. As an example, the following screen illustrates a conversion of DID number 004411111xxxx to extension xxxx. Both Session Manager digit conversion and Communication Manager incoming call handling treatment methods were tested successfully.

## 4.13. Public Unknown Numbering

Although not specifically related to COLT, this section shows the public unknown numbering configuration associated with the calls using trunk group 1. The bold row configures any four digit number beginning with 2 that uses trunk group 1 to add the prefix shown to calls made via the COLT SIP trunk.

| change public-unknown-numbering 0 |      |        |            |       | Page                  | 1 of | 2 |

## 4.15. EC500 Configuration for Diversion Header Testing

When EC500 is enabled on the Communication Manager station, a call to that station will generate a new outbound call from Communication Manager to the configured EC500 destination, typically a mobile phone. The following screen shows an example EC500 configuration for the user with station extension 30002. Use the command **change off-pbx-telephone station mapping x** where *x* is the Communication Manager station (e.g. **2373**).

- **Station Extension** – This field will automatically populate
- **Application** – Enter **EC500**
- **Dial Prefix** – Enter a prefix (e.g., 1) if required by the routing configuration
- **Phone Number** – Enter the phone that will also be called (e.g., **492222222222**)
- **Trunk Selection** – Enter **ARS**. This means ARS will be used to determine how Communication Manager will route to the **Phone Number** destination.
- **Config Set** – Enter **1**
- Other parameters can retain default values

| change off-pbx-telephone station-mapping 2373 |             |             |    |              |                 |            | Page 1 of 3 |

## 4.16. Saving Avaya Aura<sup>®</sup> Communication Manager Configuration Changes

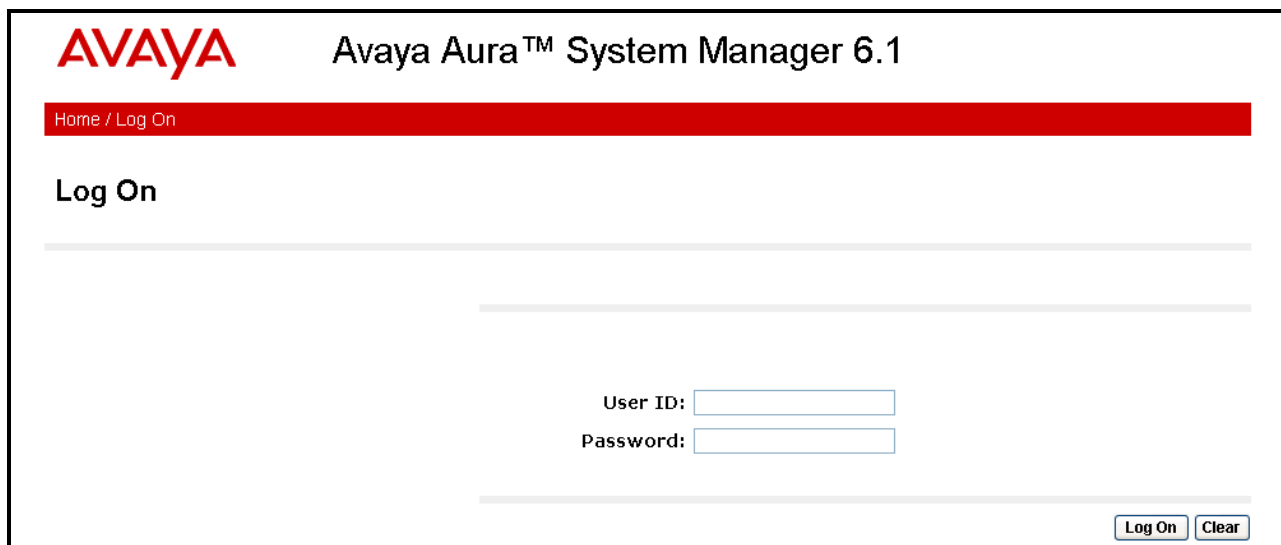

The command “save translation all” can be used to save the configuration.

## 5. Configure Avaya Aura<sup>®</sup> Session Manager Release 6.1

This section illustrates relevant aspects of the Session Manager configuration used in the verification of these Application Notes.

**Note** – The following sections assume that Session Manager and System Manager have been installed and that network connectivity exists between the two. For more information on Session Manager see [3].

Session Manager is managed via System Manager. Using a web browser, access “https://<ip-addr of System Manager>/SMGR”. In the **Log On** screen, enter appropriate **Username** and **Password** and press the **Log On** button (not shown).

The screenshot shows the Avaya Aura System Manager 6.1 web interface. At the top left is the AVAYA logo in red. To its right is the text "Avaya Aura™ System Manager 6.1". Below this is a red navigation bar with the text "Home / Log On" in white. The main content area has the heading "Log On" in bold. Below the heading are two horizontal lines, likely for a message or status. Further down are two input fields: "User ID:" followed by a text box, and "Password:" followed by a text box. At the bottom right of the form area are two buttons: "Log On" and "Clear".

Once logged in, a **Home Screen** is displayed.

When Routing is selected, the right side outlines a series of steps.

|                     |
|---------------------|
| ▼ Routing           |
| Domains             |
| Locations           |
| Adaptations         |
| SIP Entities        |
| Entity Links        |
| Time Ranges         |
| Routing Policies    |
| Dial Patterns       |
| Regular Expressions |
| Defaults            |

The sub-sections that follow are in the same order as the steps outlined under **Introduction to Network Routing Policy (NRP)** in the abridged screen shown below. In these Application Notes, all these steps are illustrated with the exception of Step 9, since “Regular Expressions” were not used.

### Introduction to Network Routing Policy

Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.

The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:

Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).

Step 2: Create "Locations"

Step 3: Create "Adaptations"

Step 4: Create "SIP Entities"

- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)
- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"

Step 5: Create the "Entity Links"

- Between Session Managers
- Between Session Managers and "other SIP Entities"

Step 6: Create "Time Ranges"

- Align with the tariff information received from the Service Providers

Step 7: Create "Routing Policies"

- Assign the appropriate "Routing Destination" and "Time Of Day"
- (Time Of Day = assign the appropriate "Time Range" and define the "Ranking")

Step 8: Create "Dial Patterns"

- Assign the appropriate "Locations" and "Routing Policies" to the "Dial Patterns"

Step 9: Create "Regular Expressions"

- Assign the appropriate "Routing Policies" to the "Regular Expressions"

Each "Routing Policy" defines the "Routing Destination" (which is a "SIP Entity") as well as the "Time of Day" and its associated "Ranking".

**IMPORTANT:** the appropriate dial patterns are defined and assigned afterwards with the help of the routing application "Dial patterns". That's why this overall routing workflow can be interpreted as

#### "Dial Pattern driven approach to define Routing Policies"

That means (with regard to steps listed above):

Step 7: "Routing Policies" are defined

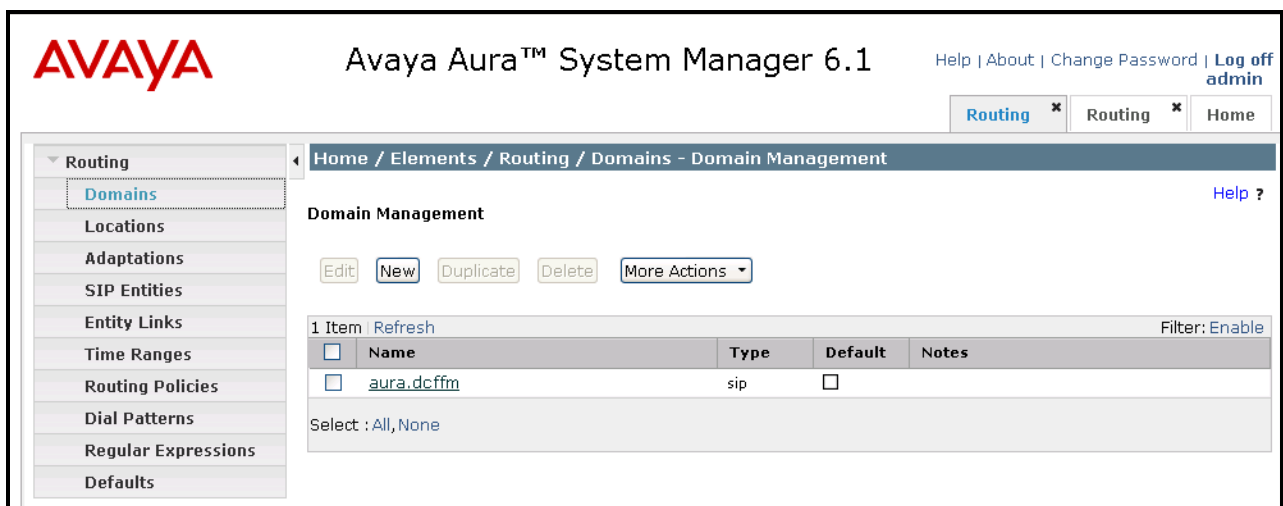

Step 8: "Dial Patterns" are defined and assigned to "Routing Policies" and "Locations" (one step)

Step 9: "Regular Expressions" are defined and assigned to "Routing Policies" (one step)

## 5.1. Domains

To view or change SIP domains, select **Routing → Domains**. Click on the checkbox next to the name of the SIP domain and **Edit** to edit an existing domain, or the **New** button to add a domain. Click the **Commit** button after changes are completed.

The following screen shows the list of configured SIP domains. The domain “aura.dcffm” is not known to the COLT production service. The domain name should match the one used in the ip-network-region described in **Section 4.5**.

| <input type="checkbox"/> | <a href="#">aura.dcffm</a> | sip  | <input type="checkbox"/> |       |

Select : All, None

## 5.2. Locations

To view or change locations, select **Routing → Locations**. The following screen shows an abridged list of configured locations. Click on the checkbox corresponding to the name of a location and **Edit** to edit an existing location, or the **New** button to add a location. Click the **Commit** button after changes are completed. Assigning unique locations can allow Session Manager to perform location-based routing, bandwidth management, and call admission control.

The screenshot displays the Avaya Aura System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title "Avaya Aura™ System Manager 6.1", and links for "Help", "About", "Change Password", and "Log off admin". Below the navigation bar, there are tabs for "Routing", "Routing", and "Home". The left sidebar shows a tree view with "Routing" expanded, containing sub-items like "Domains", "Locations", "Locations MS", "SIP Entities", "Entity Links", "Time Ranges", "Routing Policies", "Dial Patterns", "Regular Expressions", and "Defaults". The main content area is titled "Home / Elements / Routing / Locations - Location" and features a "Location" section with buttons for "Edit", "New", "Duplicate", "Delete", and "More Actions". Below these buttons is a table with 2 items, showing a list of locations with checkboxes, names, and notes. The table includes a "Filter: Enable" option and a "Select : All, None" dropdown.

| <input type="checkbox"/> | Name                      | Notes                      |
|--------------------------|---------------------------|----------------------------|

| <input type="checkbox"/> | <a href="#">Frankfurt</a> |                            |

Select : All, None

The following screen shows the location details for the location named “Aura-SBC”, corresponding to the Acme Packet 3820 Session Border Controller. Later, the location with name “Aura-SBC” will be assigned to the corresponding SIP Entity. The IP Address 192.168.150.129 of the inside (private) interface of the SBC is entered in the **IP Address Pattern** field.

The following screen shows the location details for the location named “Frankfurt”. The SIP Entities and associated IP Addresses for this location correspond to the shared components of the Avaya Interoperability Lab test environment, such as Communication Manager Release 6.0.1, Session Manager Release 6.1.

The screenshot displays the Avaya Aura™ System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title 'Avaya Aura™ System Manager 6.1', and links for 'Help | About | Change Password | Log off admin'. A secondary bar contains 'Routing' and 'Home' tabs. A left-hand menu lists various configuration categories: Routing, Domains, Locations (highlighted), Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Home / Elements / Routing / Locations - Location Details' and contains a 'Location Details' section with a 'Help ?' link and 'Commit'/'Cancel' buttons. A message states: 'Call Admission Control has been set to ignore SDP. All calls will be counted using the Default Audio Bandwidth. See Session Manager -> Session Manager Administration -> Global Setting'. The 'General' section includes a '\* Name' field with 'Frankfurt' and an empty 'Notes' field. The 'Overall Managed Bandwidth' section shows 'Managed Bandwidth Units' as 'Kbit/sec' and an empty 'Total Bandwidth' field. The 'Per-Call Bandwidth Parameters' section shows '\* Default Audio Bandwidth' as '80 Kbit/sec'. The 'Location Pattern' section has 'Add' and 'Remove' buttons, a '2 Items Refresh' indicator, and a table with columns 'IP Address Pattern' and 'Notes'. The table contains two entries: '\* 192.168.150.118' with note 'cm1.aura.dccfm' and '\* 192.168.150.115' with note 'asset.aura.dccfm'. A 'Filter: Enable' link is present. At the bottom, a 'Select : All, None' option is available.

SIP Link Monitoring

SIP Link Monitoring: Use Session Manager Configuration

## 5.5. Entity Links

To view or change Entity Links, select **Routing** → **Entity Links**. Click the **New** button to add a link for Communication Manager. Assign an appropriate Name, and select the Session Manager entity as **SIP Entity 1**, and the Communication Manager entity as **SIP Entity 2**. Assign the **Protocol** as “TCP”, select **Port** 5060, and click “Commit”.

## 5.6. Time Ranges

To view or change Time Ranges, select **Routing** → **Time Ranges**. The Routing Policies shown subsequently will use the “24/7” range since time-based routing was not the focus of these Application Notes.

## 5.7. Routing Policies

To view or change routing policies, select **Routing → Routing Policies**. Click on the checkbox corresponding to the name of a policy and **Edit** to edit an existing policy, or **New** to add a policy. Click the **Commit** button after changes are completed.

The following screen shows the **Routing Policy Details** for the policy named “rp pstn number to CM1” associated with incoming PSTN calls from COLT to Communication Manager, using the Avaya S8800 PE. Observe the **SIP Entity as Destination** is the entity named “entity-CM1”.

The screenshot displays the Avaya Aura™ System Manager 6.1 web interface. The top navigation bar includes the Avaya logo, the title 'Avaya Aura™ System Manager 6.1', and links for 'Help | About | Change Password | Log off admin'. A breadcrumb trail shows 'Home / Elements / Routing / Routing Policies - Routing Policy Details'. The left sidebar contains a menu with 'Routing' selected, and sub-items: Domains, Locations, Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies (highlighted), Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Routing Policy Details' and includes 'Commit' and 'Cancel' buttons. It is divided into three sections: 'General' with fields for 'Name' (rp pstn number to CM1), 'Disabled' (checkbox), and 'Notes' (Route inbound calls to CM1); 'SIP Entity as Destination' with a 'Select' button and a table listing 'entity-CM1' with FQDN 'cm1.aura.dffm' and IP '192.168.150.118'; and 'Time of Day' with 'Add', 'Remove', and 'View Gaps/Overlaps' buttons. Below is a table with one item showing a time range from 00:00 to 23:59 on 24/7.

| Name       | FQDN or IP Address | Type | Notes           |
|------------|--------------------|------|-----------------|
| entity-CM1 | cm1.aura.dffm      | CM   | 192.168.150.118 |

| Ranking 1 | Name 2 | Mon | Tue | Wed | Thu | Fri | Sat | Sun | Start Time | End Time | Notes           |
|-----------|--------|-----|-----|-----|-----|-----|-----|-----|------------|----------|-----------------|
| 0         | 24/7   | ✓   | ✓   | ✓   | ✓   | ✓   | ✓   | ✓   | 00:00      | 23:59    | Time Range 24/7 |

The following screen shows the **Routing Policy Details** for the policy named “rp to PSTN” associated with outgoing calls from Communication Manager to the PSTN via COLT through the Acme Packet 3820 SBC. Observe the **SIP Entity as Destination** is the entity named “entity-Aura-SBC”.

## 5.8. Dial Patterns

To view or change dial patterns, select **Routing → Dial Patterns**. Click on the checkbox corresponding to the name of a pattern and **Edit** to edit an existing pattern, or **New** to add a pattern. Click the **Commit** button after changes are completed.

The following screen illustrates an example dial pattern used to verify inbound PSTN calls to the enterprise. When a user on the PSTN dials a number assigned to the COLT VoIP Access SIP Service, such as 0044111112371, COLT delivers the number to the enterprise, and the Acme Packet 3820 SBC sends the call to Session Manager. The pattern below matches on 004411111237 specifically. Dial patterns can alternatively match on ranges of numbers (e.g., a DID block). Under **Originating Locations and Routing Policies**, the routing policy named “rp\_pstn number to CM1” is selected, which sends the call to Communication Manager as described previously.

The following screen illustrates an example dial pattern used to verify outbound calls from the enterprise to the PSTN. When a Communication Manager user dials a PSTN number such as 001-908-848-5704, Communication Manager sends the call to Session Manager, via the S8800 PE. Session Manager will match the dial pattern shown below and send the call to the Acme Packet 3820 SBC via the **Routing Policy Name** “rp to PSTN”.

## 7. COLT VoIP Access SIP Service Offer Configuration

Information regarding COLT VoIP Access SIP Service offer can be found at <http://www.colt.net> or by contacting a COLT VoIP Access SIP Service sales representative.

The sample configuration described in these Application Notes was located in the Avaya Solutions and Interoperability Lab. COLT VoIP Access SIP Service provided all of the necessary service provisioning.

### 7.1. Fully Qualified Domain Name (FQDN)s

The COLT network uses IP addresses instead of domain names.

## 8. General Test Approach and Test Results

The test approach was manual testing of inbound and outbound calls using the COLT VoIP Access SIP Service on a production COLT VoIP access circuit, as shown in **Figure 1**. The test requirements specified in section 1.1 were tested successfully. Examples of the verified call scenarios are detailed in Section 9.

## 9. Verification Steps

This section provides example verifications of the Avaya configuration with COLT VoIP Access SIP Service. Verification scenarios for the configuration described in these Application Notes included the following:

- Inbound and outbound voice calls between telephones controlled by Avaya Aura<sup>®</sup> Communication Manager and the PSTN can be made using G.711MU or G.729A codecs.
- Inbound and outbound Fax calls between Avaya Aura<sup>®</sup> Communication Manager and PSTN can be made in both directions using T.38 .
- Direct IP-to-IP Media (also known as “Shuffling”) when applicable.
- DTMF Tone Support as specified by RCF2833
  - Outbound call to PSTN application requiring post-answer DTMF (e.g., an IVR or voice mail system)
  - Inbound call from PSTN to Avaya CPE application requiring post-answer DTMF (e.g., Avaya Modular Messaging, Avaya vector digit collection steps)
- Additional PSTN numbering plans (e.g. International, operator assist, 411)
- Hold / Retrieve with music on hold
- Call transfer
- Conference calls
- Voicemail Coverage and Retrieval
- SIP Diversion Header for call re-direction
  - Call Forwarding
  - EC500
- Long hold time calls

## 9.1. Avaya Aura® Communication Manager Verifications

This section illustrates verifications from Avaya Aura® Communication Manager.

### 9.1.1 Example Incoming Call from PSTN via COLT SIP Trunk

Incoming PSTN calls arrive from COLT at the Acme Packet 3820 SBC, which sends the call to Session Manager. Session Manager sends the call to Communication Manager via the entity link corresponding to the Avaya S8800 PE. On Communication Manager, the incoming call arrives via signaling group 1 and trunk group 1.

The following Communication Manager “list trace” trace output shows a call incoming on trunk group 1. The PSTN telephone dialed 00044111112371. The incoming call handling table for trunk group 1 converted the number to 2371. Extension 2371 is a SIP Telephone with IP Address 192.168.150.86. Initially, the G450 Media Gateway (192.168.150.124) is used, but as can be seen in the final trace output, once the call is answered, the final RTP media path is “ip-direct” from the IP Telephone (192.168.150.86) to the “inside” of the Acme Packet 3820 SBC (192.168.150.129).

```

### **9.1.2 Example Outgoing Call to PSTN via COLT SIP Trunk**

The following trace shows an outbound ARS call from IP Telephone x2371 to the PSTN number 00496975056645. The call is routed to route pattern 1 and trunk group 1. The call initially uses the gateway (192.168.150.124), but after the call is answered, the call is “shuffled” to become an “ip-direct” connection between the IP Telephone (192.168.150.86) and the “inside” of the Acme 3820 SBC (192.168.150.129). In this case, the mapping from the caller’s extension to the full DID number was performed in Session Manager.

## 9.2. Avaya Aura® System Manager and Session Manager Verification

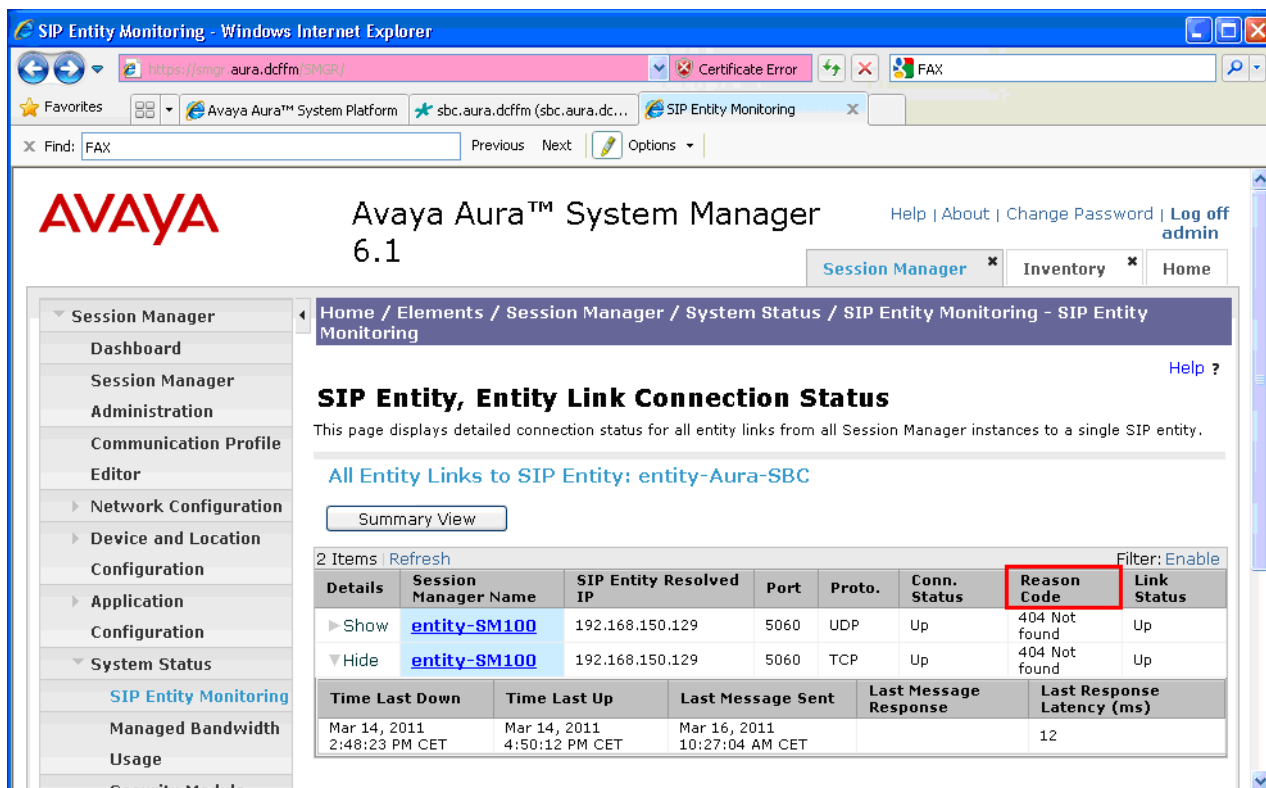

This section contains verification steps that may be performed using Avaya Aura® System Manager for Avaya Aura® Session Manager.

### 9.2.1 Verify SIP Entity Link Status

Log in to System Manager. Expand **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring**, as shown below.

From the list of monitored entities, select an entity of interest, such as “entity-Aura-SBC”. Under normal operating conditions, the **Link Status** should be “Up” as shown in the example screen below. The **Reason Code** column indicates that the Aura SBC has responded to SIP OPTIONS from Session Manager with a SIP 404 message, which is sufficient for SIP Link Monitoring to consider the link up.

**AVAYA** Avaya Aura™ System Manager 6.1

## 10. Conclusion

As illustrated in these Application Notes, Avaya Aura<sup>®</sup> Communication Manager 6.0, Avaya Aura<sup>®</sup> Session Manager 6.0, and the Acme Packet 3820 SBC can be configured to interoperate successfully with COLT VoIP Access SIP Service. This solution allows Avaya Aura<sup>®</sup> Communication Manager and Avaya Aura<sup>®</sup> Session Manager customers access to the PSTN using a COLT VoIP Access SIP Service IP Trunk public SIP trunk service connection.
