

Avaya Solution & Interoperability Test Lab

Application Notes for Raytheon JPS ACU-2000IP with Avaya Communication Manager and Avaya SIP Enablement Services – Issue 1.0

Abstract

These Application Notes describe the configuration steps required for Raytheon JPS ACU-2000IP to interoperate with Avaya Communication Manager and Avaya SIP Enablement Services.

The ACU-2000IP offers a full suite of network capabilities including linking of radios over an IP network, control of large interoperability systems via IP, remote channel change over IP, and the ability to interface radios via SIP. The ACU-2000IP is modular, completely scalable, and field-configurable to meet customer needs. During the compliance test effort, only the SIP Control Module (SCM) was tested.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the procedures for configuring Raytheon JPS ACU-2000IP, which was compliance tested with Avaya Communication Manager and Avaya SIP Enablement Services. The overall objective of the interoperability compliance testing is to verify Raytheon JPS ACU-2000IP features in an environment comprised of Avaya Communication Manager, Avaya SIP Enablement Services, various Avaya IP Telephones, and various Avaya SIP endpoints.

The ACU-2000IP offers a full suite of network capabilities including linking of radios over an IP network, control of large interoperability systems via IP, remote channel change over IP, and the ability to interface radios via SIP. These systems can be linked, monitored and controlled over an IP network, and the SIP capabilities allow SIP-based systems or individual SIP endpoints (such as SIP phones or softphones) to be included. The ACU-2000IP is modular, scalable, and field-configurable to meet customer needs.

During the compliance test effort, only the SIP Control Module (SCM) was tested. The SCM is a SIP proxy that acts as a SIP endpoint.

Figure 1 provides the test configuration used for the compliance testing.

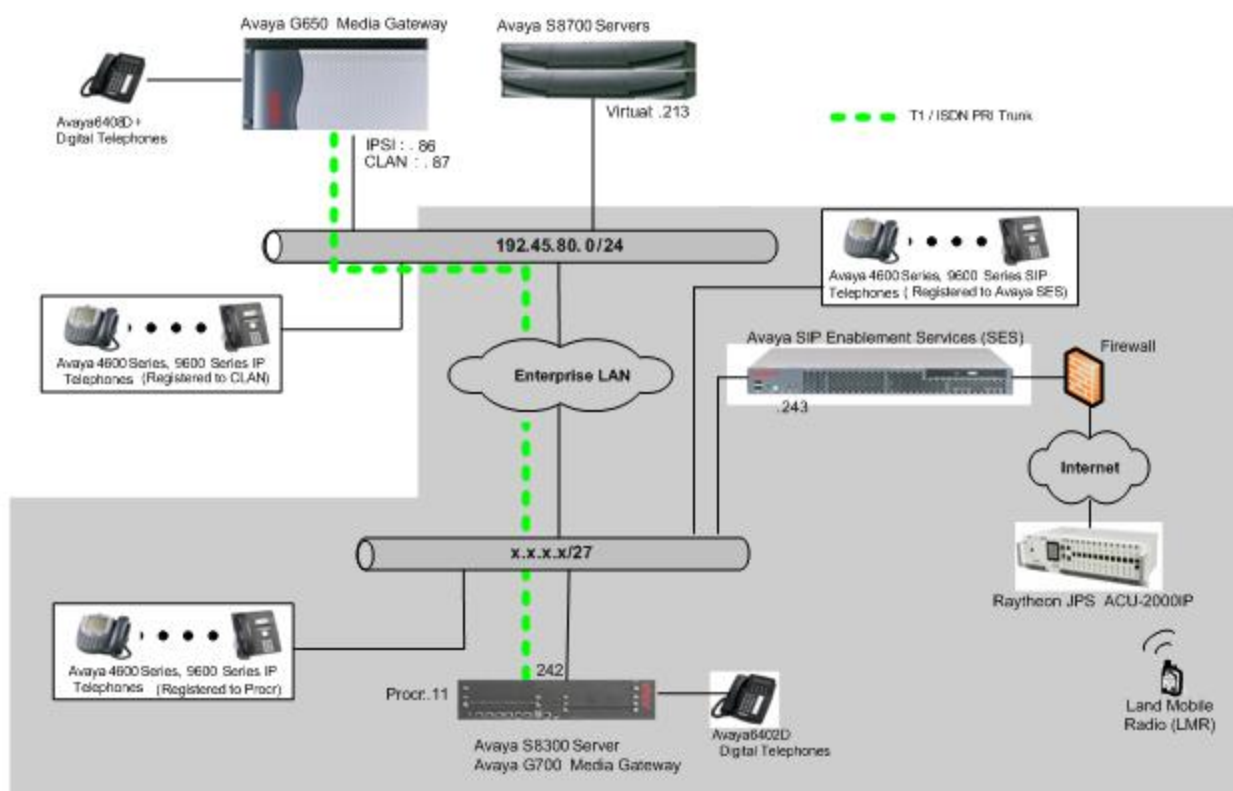

Figure 1: Test Configuration for JPS ACU-2000IP with Avaya Communication Manager and Avaya SES

2. Equipment and Software Validated

The following equipment and software were used for the sample configuration:

Equipment		Software/Firmware
Avaya S8700 Servers		Avaya Communication Manager 4.0.1 (R014x.00.1.731.2)
Avaya G650 Media Gateway		
	TN2312BP IP Server Interface	HW11 FW030
	TN799DP CLAN Interface	HW01 FW024
	TN2302AP IP Media Processor	HW20 FW117
Avaya S8300 Server with Avaya G700 Media Gateway		Avaya Communication Manager 4.0.1 (R014x.00.1.731.2)
Avaya S8500 Server		Avaya SIP Enablement Services 4.0 (Build 33.6)
Avaya 4600 Series IP Telephones		
	4620SW(H.323)	2.8
	4625SW(H.323)	2.8
	4610SW (SIP)	2.2.2
Avaya 9600 Series IP Telephones		
	9630 (H.323)	1.5
	9650 (H.323)	1.5
	9630 (SIP)	1.0.13.1
Avaya 6400D Series Digital Telephones		-
Raytheon JPS ACU-2000IP		2.0.1

3. Configure Avaya Communication Manager

This section describes the procedure for setting up a SIP trunk between Avaya Communication Manager and Avaya SES. The steps include setting up an IP codec set, an IP network region, an IP node name, a signaling group, a trunk group, and a SIP station. Before a trunk can be configured, it is necessary to verify if there is enough capacity to set up an additional trunk. The highlights in the following screens indicate the values used during the compliance testing. Default values may be used for all other fields.

These steps are performed from the Avaya Communication Manager System Access Terminal (SAT) interface. SIP telephones are configured as off-PBX telephones in Avaya Communication Manager.

3.1. Capacity Verification

Enter the **display system-parameters customer-options** command. Verify that there are sufficient Maximum Off-PBX Telephones – OPS licenses. If not, contact an authorized Avaya account representative to obtain additional licenses

display system-parameters customer-options		Page	1 of 11
OPTIONAL FEATURES			
G3 Version: V14			
Location: 1		RFA System ID (SID): 1	
Platform: 7		RFA Module ID (MID): 1	
			USED
Platform Maximum Ports: 900			95
Maximum Stations: 450			17
Maximum XMOBILE Stations: 0			0

Maximum Number of Expanded Meet-me Conference Ports: 0			0

3.2. IP Codec Set

This section describes the steps for administering an IP codec set in Avaya Communication Manager. This IP codec set is used in the IP network region for communications between Avaya Communication Manager and Avaya SES. Enter the **change ip-codec-set <c>** command, where **c** is a number between **1** and **7**, inclusive. IP codec sets are used in **Section 3.3** when configuring

an IP network region to specify which audio codecs may be used within and between network regions. The ACU-2000IP only supports G.711MU. Retain all other default field values.

```
change ip-codec-set 1                                     Page 1 of 2

3:
```

3.3. Configure IP Network Region

This section describes the steps for administering an IP network region in Avaya Communication Manager for communication between Avaya Communication Manager and Avaya SES. Enter the **change ip-network-region <n>** command, where **n** is a number between **1** and **250** inclusive, and configure the following:

- Authoritative Domain – This should match the SIP Domain value on Avaya SES, in **Section 4.1**. In the test configuration, **testroom.com** was used.
- Codec Set – Enter the IP codec set number as provisioned in **Section 3.2**.

```
change ip-network-region 1                               Page 1 of 19

                                IP NETWORK REGION

Region: 1
Location:      Authoritative Domain: testroom.com

Idle Traffic Interval (sec): 20
Keep-Alive Interval (sec): 5
Keep-Alive Count: 5
```

3.4. Configure IP Node Name

This section describes the steps for setting an IP node name for Avaya SES in Avaya Communication Manager running on an Avaya S8300 Server. Enter the **change node-names ip**

command, and add a node name for Avaya SES along with its IP address. The Processor-Ethernet (procr) board (or, in the case of an Avaya S8700-series Server, a CLAN board) will be used as well in subsequent steps in these Application Notes.

change node-names ip		Page 1 of 2
		IP NODE NAMES
Name	IP Address	
default	0.0.0.0	
procr	12.176.170.242	
SES	12.176.170.243	

3.5. Configure SIP Signaling Group

This section describes the steps for administering a signaling group in Avaya Communication Manager for communication between Avaya Communication Manager and Avaya SES. Enter the **add signaling-group <s>** command, where **s** is an available signaling group, and configure the following:

- Group Type – Set to **sip**.
- Near-end Node Name - Set to **procr** as displayed in **Section 3.4**.
- Far-end Node Name - Set to the Avaya SES name configured in **Section 3.4**.
- Far-end Network Region - Set to the region configured in **Section 3.3**.
- Far-end Domain - This should match the SIP Domain value in **Section 4.1**. In the test configuration, **testroom.com** was used.

add signaling-group 1		Page 1 of 1
		SIGNALING GROUP
Group Number: 1	Group Type: sip	
	Transport Method: tls	
Near-end Node Name: procr	Far-end Node Name: SES	
Near-end Listen Port: 5061	Far-end Listen Port: 5061	
Far-end Domain: testroom.com	Far-end Network Region: 1	
	Bypass If IP Threshold Exceeded? n	
DTMF over IP: rtp-payload	Direct IP-IP Audio Connections? n	
	IP Audio Hairpinning? n	
Enable Layer 3 Test? n		
Session Establishment Timer(min): 3		

3.6. Configure SIP Trunk Group

This section describes the steps for administering a trunk group in Avaya Communication Manager for communication between Avaya Communication Manager and Avaya SES. Enter the **add trunk-group <t>** command, where **t** is an unallocated trunk group, and configure the following:

- Group Type – Set to **sip**.
- Group Name – Enter a descriptive name.
- TAC– Set to any available trunk access code that is valid in the provisioned dial plan.
- Signaling Group – Set to the Group Number field value configured in **Section 3.5**.
- Number of Members – Allowed value is between 0 and 255. Set to a value large enough to accommodate the number of SIP telephone extensions being used, but still within the maximum number allowed (see **Section 3.1**).
- Service Type – Set to **tie**.

```
add trunk-group 1                                     Page 1 of 21
                                                    TRUNK GROUP

Group Number: 1                                     Group Type: sip          CDR Reports: y
Group Name: to SES                                COR: 1                TN: 1                TAC: 115
Direction: two-way                               Outgoing Display? n
Dial Access? n                                    Night Service:
Queue Length: 0
Service Type: tie                                Auth Code? n
                                                    Signaling Group: 1
                                                    Number of Members: 10
```

On **Page 5** of the trunk-group form, verify that all trunk group members are assigned, as shown below.

```
add trunk-group 1                                     Page 5 of 21
                                                    TRUNK GROUP

GROUP MEMBER ASSIGNMENTS                        Total Administered Members: 10

Port      Name
1: T00001  to SES
2: T00002  to SES
3: T00003  to SES
4: T00004  to SES
5: T00005  to SES
6: T00006  to SES
7: T00007  to SES
8: T00008  to SES
9: T00009  to SES
10: T00010 to SES
```

3.7. Configure SIP Endpoint

This section describes the steps for administering OPS stations in Avaya Communication Manager and associating the OPS station extensions with the telephone numbers of Land Mobile

Radios (LMR). Enter **add station s**, where **s** is an extension valid in the provisioned dial plan. The following fields were configured for the compliance test.

- Type – Set to **4620**.
- Name – Enter a descriptive name

Repeat this step as necessary to configure additional SIP endpoint extensions.

```

add station 20001                                     Page 1 of 5
                                     STATION

Message Lamp Ext: 20001
Speakerphone: 2-way                                Mute Button Enabled? y
Display Language: english                          Expansion Module? n
Survivable GK Node Name:
Survivable COR: internal                           Media Complex Ext:
Survivable Trunk Dest? y                           IP SoftPhone? n
                                                    Customizable Labels? y

```

Enter the **add off-pbx-telephone station-mapping** command and configure the following:

- Station Extension – Enter the extension configured above.
- Application – Set to **OPS**.
- Phone Number – Enter the number that LMR will use for registration and call termination. In the example below, the Phone Number is the same as the Station Extension, but is not required to be the same.
- Config Set – Set to **1**, which contains the default values.
- Trunk Select – Set to the trunk group number configured in **Section 3.6**.

The following screen shows the OPS stations created during the compliance test.

```
list off-pbx-telephone station-mapping
```

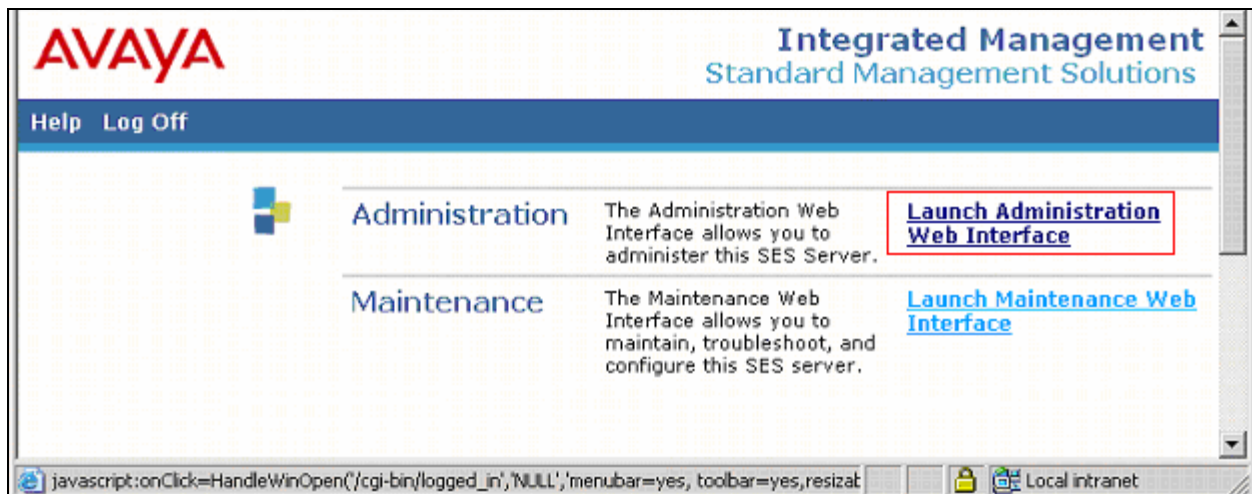

STATION TO OFF-PBX TELEPHONE MAPPING							
Station Extension	Appl	CC	Phone Number	Config Set	Trunk Select	Mapping Mode	Calls Allowed
20001	OPS		20001	1 /	1	both	all

20008	OPS		20008	1 /	1	both	all
20009	OPS		20009	1 /	1	both	all
20010	OPS		20010	1 /	1	both	all

4. Configure Avaya SES

This section describes the steps for creating a SIP trunk between Avaya SES and Avaya Communication Manager. SIP user accounts are configured in Avaya SES and associated with an Avaya Communication Manager OPS station extension. LMRs will register with Avaya SES using the SIP user accounts. The highlights in the following screens indicate the values used during the compliance test. Default values may be used for all other fields.

4.1. Configure SES Server Properties

Launch a web browser, enter <https://<IP address of SES server>/admin> in the URL, and log in with the appropriate credentials. Click on the **Launch Administration Web Interface** link upon successful login.

In the **Integrated Management SIP Server Management** page, select the **Server Configuration → System Properties** link from the left pane of the screen. Verify the SIP Domain matches the Far-end Domain field value configured for the signaling group in Avaya Communication Manager in **Section 3.5**. Click on the **Update** button if a field change was necessary.

SES_Version SES-4.0.0.0-033.6
System Configuration simplex
Host Type home/edge

SIP Domain* testroom.com

Note that the DNS domain is: testroom.com

If you are unsure about this field, most often the SIP domain should be the root level DNS domain. For example, for a DNS domain of eastcoast.example.com, the SIP domain would likely be configured to example.com. This allows SIP calls and instant messages to users with handles of the format handle@example.com

4.2. Configure Media Server Interface

This section provides steps to add SIP-enabled media servers to the SIP domain. In the **Integrated Management SIP Server Management** page, select the **Media Servers → Add** link from the left pane of the screen. The following screen shows the Add Media Server Interface page. The highlighted fields were configured for the compliance test:

- Media Server Interface Name – Enter a descriptive name for the media server interface.

- Host – From the drop-down list of IP addresses, select the IP address of the Avaya SES server to be associated with the Media Server interface.
- SIP Trunk Link Type – Select **TLS**.
- SIP Trunk IP Address – Enter the IP address for the media server's procr (or CLAN) IP interface that terminates the SIP link from Avaya SES (see **Section 3.4**).

Click **Add** when finished.

5. Configure Raytheon JPS ACU-2000IP

This section describes the steps for configuring the SIP Control Module (SCM) in the JPS ACU-2000IP unit. SIP user accounts are configured in Avaya SES and associated with an Avaya Communication Manager OPS station extension. LMRs will register with Avaya SES using the SIP user accounts. The highlights in the following screens indicate the values used during the compliance test. Default values may be used for all other fields.

Launch a web browser, enter <http://<IP address of SCM>> in the URL, and log in with the appropriate credentials to access the SIP Control Module (SCM) page.

Enter Network Password

Please type your user name and password.

Site: 24.199.150.203

Realm: 24.199.150.203:80

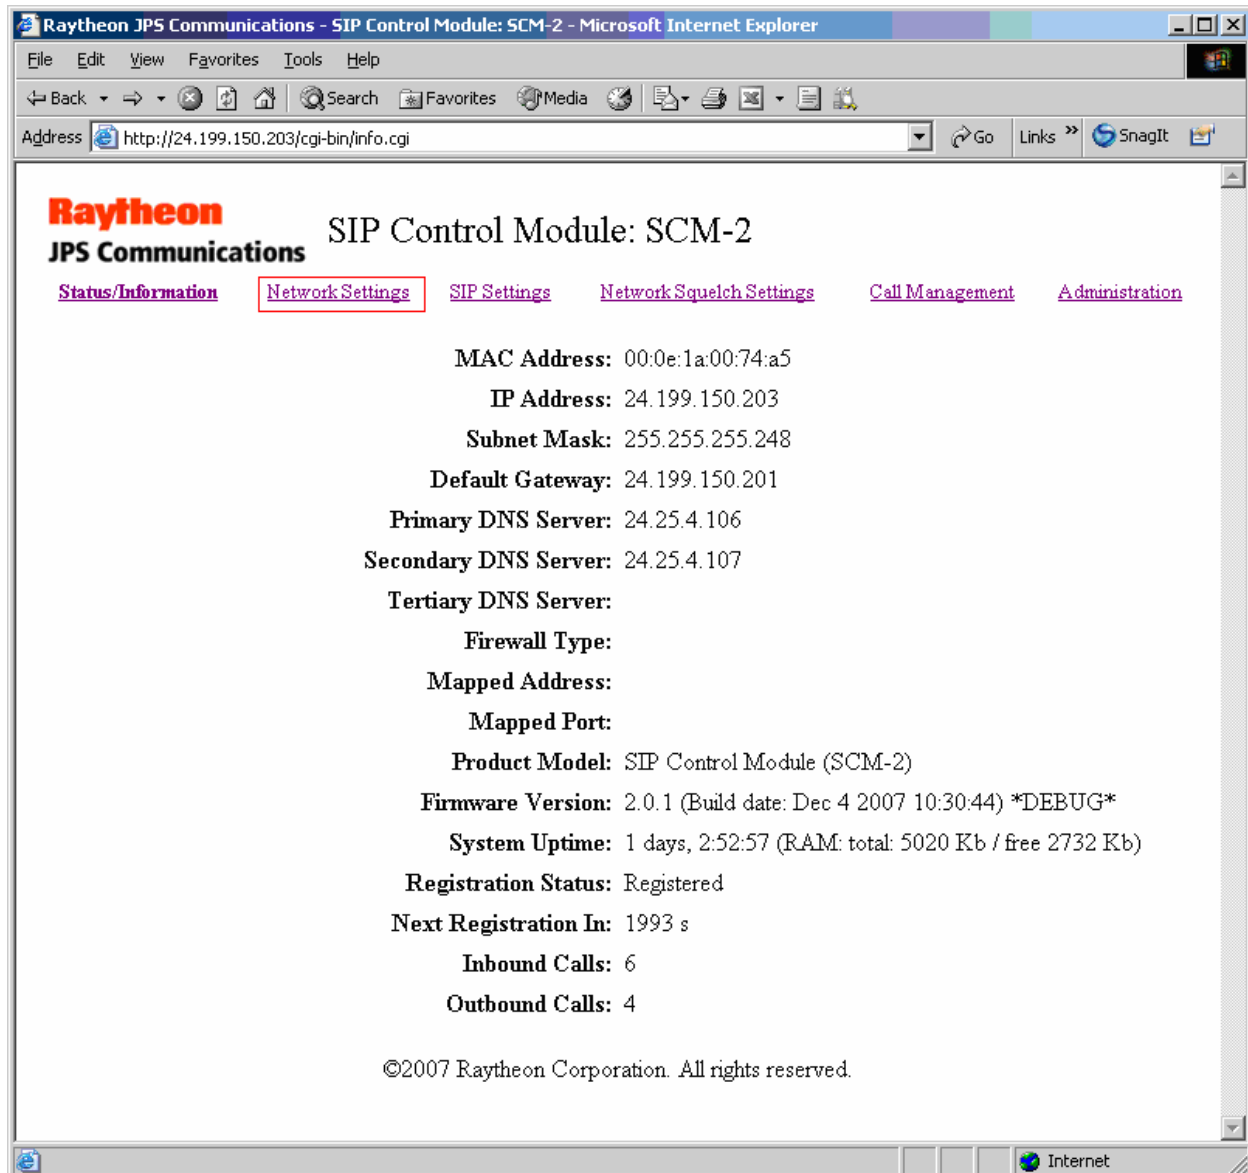

User Name

6. Interoperability Compliance Testing

The interoperability compliance testing included basic feature and serviceability testing. The feature testing evaluated the ability of JPS ACU-2000IP to register, make outbound calls (to Avaya SIP endpoints and Avaya H.323 IP telephones), and receive inbound calls (from Avaya SIP endpoints and Avaya H.323 IP telephones). The serviceability testing introduced failure conditions to see if JPS ACU-2000IP or the SCM can resume its functions after failure recovery.

6.1. General Test Approach

All test cases were performed manually. The general approach was to register the SCM to Avaya SES, place outbound calls, and receive inbound calls. Serviceability failures were simulated by disconnecting cables, and circuit packs as well as resetting the Avaya S8300 Server.

6.2. Test Results

All test cases were executed and passed.

7. Verification Steps

This section provides the tests that can be performed to verify proper configuration of Avaya Communication Manager, Avaya SES, and JPS ACU-2000IP.

- In the Avaya SES **Integrated Management SIP Server Management** page, select the **Users → Registered Users** link from the left pane of the screen. Verify all SIP endpoints are registered.

The screenshot displays the Avaya Integrated Management SIP Server Management interface. The top header shows the Avaya logo and the title 'Integrated Management SIP Server Management' with the server address '192.11.13.6'. A navigation menu on the left lists various configuration options, with 'Registered Users' selected. The main content area, titled 'Registered Users on 192.11.13.6', shows a table of registered contacts. The table has two columns: 'Handle and Name' and 'Address'. There are five rows of data, each with a checkbox in the first column. Below the table, there are two checkboxes for applying settings to all registered users, and a 'Task' dropdown menu set to 'Reload-complete' with a 'Submit' button.

Handle and Name	Address
<input type="checkbox"/> 20001@testroom.com 20001, SIP	sip:20001@12.176.170.247:5060
<input type="checkbox"/> 20002@testroom.com 20002, sip	sip:20002@12.176.170.249;transport=tcp
<input type="checkbox"/> 20005@testroom.com 20005, sip	sip:20005@24.199.150.204:5060
<input type="checkbox"/> 20006@testroom.com 20006, sip	sip:20006@24.199.150.203:5060
<input type="checkbox"/> 20007@testroom.com 20007, sip	sip:20007@24.199.150.202

Using a network protocol analyzer, verify correct REGISTER messages are exchanged between Avaya SES and JPS ACU-2000IP.

No. -	Time	Source	Destination	Protocol	Info
122	18.128237	24.199.150.203	12.176.170.243	SIP	Request: REGISTER sip:12.176.170.243

8. Support

Technical support on the ACU-2000IP or SCM can be obtained through the following:

- **Phone:** (919) 790-1011 or (800) 498-3137
- **Web:** <http://www.jps.com/support>

9. Conclusion

These Application Notes describe the configuration steps required for Raytheon JPS ACU-2000IP to interoperate with Avaya Communication Manager and Avaya SIP Enablement Services. All feature and serviceability test cases were completed.
