

Avaya Solution & Interoperability Test Lab

Application Notes for Mitel InAttend using Mitel Attendant Connectivity Server V2.6 to interoperate with Avaya Aura® Communication Manager R10.1 - Issue 1.0

Abstract

These Application Notes describe the configuration steps required for Mitel InAttend v2.6 SP4 using Mitel Attendant Connectivity Server from Mitel Sweden AB to interoperate with Avaya Aura® Communication Manager R10.1. The Mitel solution makes use of two separate connections to Avaya Aura® Session Manager and to Avaya Aura® Application Enablement Services.

Readers should pay attention to **Section 2**, in particular the scope of testing as outlined in **Section 2.1** as well as the observations noted in **Section 2.2**, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the configuration steps required for Mitel InAttend using Mitel Attendant Connectivity Server V2.6 SP4 from Mitel Sweden AB to interoperate with Avaya Aura® Communication Manager R10.1 utilizing a SIP trunk connection to Avaya Aura® Session Manager R10.1 and a TSAPI connection to Avaya Aura® Application Enablement Services (AES).

Mitel InAttend is the core application in the Mitel attendant offering and an essential part in the Mitel Collaboration Management (CMG). It is a multi-featured attendant solution that is built on open standards and offers advanced collaboration features. The InAttend attendant console provides all necessary information for efficient call handling yet is fully integrated with the Mitel CMG for a complete Unified Communications experience. The InAttend SIP-based platform opens a way for integration with Avaya Aura® Communication Manager utilising a SIP connection to Avaya Aura® Session Manager using the Mitel Attendant Connectivity Server (ACS).

The ACS is responsible for the SIP connection to Session Manager and is part of the Attendant Platform which provides Private Branch Exchanges (PBX) with extended functionality. The Attendant client communicates with the private branch exchange through ACS. Using an attendant client, attendants can initiate, answer, transfer and disconnect calls. The call queuing functionality with configurable call queues also supports camp on services. Other features include automatic call distribution, which distributes the call to the attendant with the longest idle time, and direct drop to voicemail, which lets the attendant transfer calls directly to subscriber's voicemail. ACS also provides a speech attendant that enables a caller to request a user by name, and if busy, enables the caller to be transferred to an attendant, to the user's voicemail, or added to a conference. ACS also incorporates its own voicemail system.

The Mitel InAttend solution makes use of two TSAPI connections to Avaya Aura® Application Enablement Services.

- TSAPI connection from the CMG – Used to set Call Forwarding and Message Waiting.
- TSAPI connection from the InAttend server – Used to monitor devices to provide Presence information.

Mitel InAttend is made up of the following all installed on the same sever.

- Mitel Attendant Connectivity Server.
 - NeTS 5.12.4034.0
 - MediaServer 1.9.187
 - QueueManager 2.18.4034.0
- Mitel InAttend Server.
 - Collaboration Management CMG 8.5 SP4
 - Virtual Reception 8.5 SP4
 - Microsoft SQL 2019
 - Mitel InAttend Server 2.6 SP4

During compliance testing various applications such as Virtual Reception which consists of Speech Attendant and Speech Office, and these were tested alongside the InAttend console. These applications utilize the ACS to connect to Session Manager and the Mitel InAttend Server to connect to TSAPI. Each of these applications add to the overall solution and this solution will be referenced as “InAttend” throughout the remainder of this document unless there is a specific reason to refer to a specific application.

Mitel supply, install and configure their solution for the end customer through qualified partners. In line with Mitel’s request the configuration of InAttend is not necessarily required to be part of these Application Notes, however **Section 8** does include screen shots of the setup that was used during compliance testing.

2. General Test Approach and Test Results

The general test approach was to configure InAttend to communicate with the Communication Manager as implemented on a customer’s premises using a SIP connection to Session Manager and a TSAPI connection to AES. Testing focused on verifying that ACS registered with Session Manager as a SIP Entity and both TSAPI connections showing that all features behaved as expected. Various call scenarios were performed to simulate real call types as would be observed on a customer premises. See **Figure 1** for a network diagram. The interoperability compliance test included both feature functionality and serviceability tests.

The ACS is configured as a SIP Entity on Session Manager acting as a third-party PBX connecting to the Avaya solution over a SIP trunk. The connection was setup using TCP transport and port 5060. Calls were then made from Communication Manager to the Mitel Attendant using a Dialling Plan on Communication Manager. Calls can be made between the Mitel solution and Communication Manager extensions by a connection between the ACS and Session Manager.

The TSAPI client is installed on the InAttend server which also runs the CMG database. This client then connected to the AES using a user/password created on AES allowing the TSAPI events be passed to the InAttend server and be processed by the applications there.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member’s solution.

Avaya recommends our customers implement Avaya solutions using appropriate security and encryption capabilities enabled by our products. The testing referenced in these DevConnect Application Notes included the enablement of supported encryption capabilities in the Avaya products. Readers should consult the appropriate Avaya product documentation for further information regarding security and encryption capabilities supported by those Avaya products.

Support for these security and encryption capabilities in any non-Avaya solution component is the responsibility of each individual vendor. Readers should consult the appropriate vendor-supplied product documentation for more information regarding those products.

For the testing associated with these Application Notes, the interface between Avaya systems and Mitel InAttend did not include use of any specific encryption features as requested by Mitel.

2.1. Interoperability Compliance Testing

The testing included:

- Verification of connectivity between Communication Manager and InAttend via Session Manager and AES
- InAttend and Speech Attendant transfers calls
- Supervised and unsupervised transfer with answer
- Directing callers to conference calls via Speech Attendant
- Call queuing and retrieval
- Detection for busy and unanswered extensions
- End to end signalling
- Call re-queuing
- Direct drop to voice mail
- Setting Call Forward and Message Waiting
- Observing Presence Information
- Serviceability tests simulating a LAN failure

2.2. Test Results

Tests were performed to ensure full interoperability of the Mitel solution with Communication Manager using the connection between the ACS and Session Manager and a TSAPI connection between the InAttend server and AES. The tests were all functional in nature and performance testing was not included. All test cases passed successfully with the following observations noted.

1. When Call Forwarding Enhanced is used to forward an Avaya extension to InAttend, be that Call Forward No Answer or Call Forward Busy, InAttend is not aware of the reason that the call is being forwarded. This appears to be a breakage on the InAttend software and Mitel are aware of this and are investigating the issue.
2. When Coverage Path is used to forward an Avaya extension to InAttend, be that Call Forward No Answer or Call Forward Busy, InAttend is not aware of the reason that the call is being forwarded. This appears to be a breakage on the InAttend software and Mitel are aware of this and are investigating the issue.
3. Mitel requires that a person's phone is forwarded to the conference application for a conference to take place. A Communication Manager user/extension will get a busy tone when attempting to call itself when the extension is forwarded. When the administrator of a conference needs to dial in to that conference, they will call their extension from another known source i.e., their mobile phone. This mobile number would be associated with this user/extension on the Mitel database and so this call would be recognised as the

conference administrator dialling in. A Coverage Path can also be used instead of Call Forward and this will allow the user call in from the phone itself.

2.3. Support

Technical support from Mitel can be obtained through the following.

Web: www.Mitel.com/service-and-support

Tel: +1 800-722-1301

Partners can log on to <https://miaccess.mitel.com/idp/index.xhtml> where access to TeamTrack is given for reporting issues.

3. Reference Configuration

Figure 1 illustrates the network topology used during compliance testing. The Avaya solution consists of a Communication Manager, Session Manager and AES. Mitel InAttend is installed on a Windows Server 2019 OS. A network telephony server and SQL were also installed on the same server. On Communication Manager, the routing was configured to route 450x calls to Session Manager which in turn were routed to the ACS. Mitel InAttend was installed and configured on a client PC. H323, SIP and Digital phones were configured on Communication Manager to generate calls to Mitel InAttend and outbound calls to a simulated PSTN. A TSAPI connection was utilized between the Mitel InAttend server and AES.

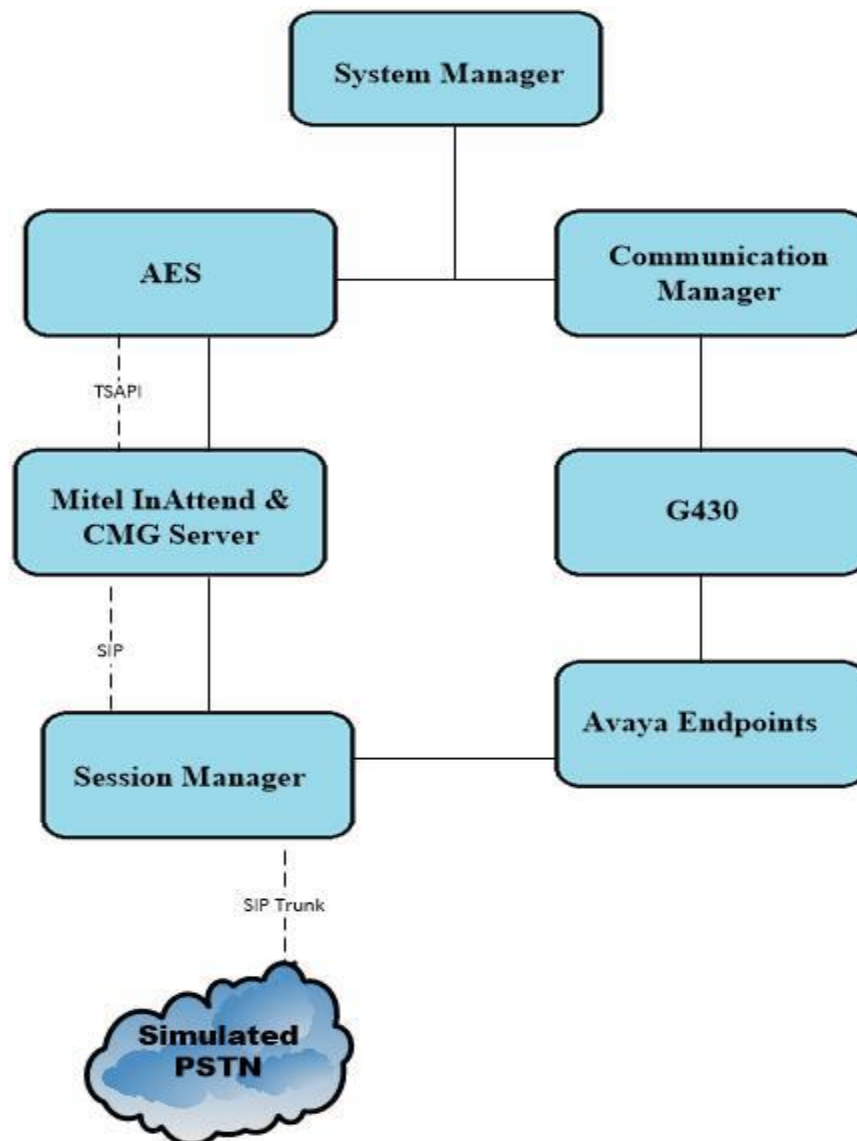

Figure 1: Avaya Aura® Communication Manager and Mitel InAttend configuration

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Avaya Equipment/Software	Release/ Version
Avaya Aura® System Manager	System Manager 10.1.0.2 SP2 Build No. – 10.1.0.0.537353 Software Update Revision No: 10.1.0.2.0715160
Avaya Aura® Session Manager	Session Manager R10.1 SP2 Build No. – 10.1.0.2.1010219
Avaya Aura® Communication Manager	R10.1.0.2.0 – SP2 R020x.01.0.974.0 Update ID 01.0.974.0-27607
Avaya Aura® Application Enablement Services	R10.1 10.1.0.2.0.12-0
Avaya Session Border Controller for Enterprise	8.1.3.0-31-21052
Avaya Media Gateway G450	42.7.0/2
Avaya J100 Series (H323)	6.8502
Avaya J100 Series (SIP)	4.0.7.0
Avaya 9408 Digital Deskphone	V2.0
Mitel Equipment/Software	Release/ Version
Mitel Attendant Connectivity server running on Windows 2019	Mitel Attendant Connectivity Server includes: NeTS 5.12.4034.0 MediaServer 1.9.187 QueueManager 2.18.4034.0
Mitel InAttend server running on Windows 2019	Version 2.6 SP4 Mitel InAttend Server includes: CMG 8.5 SP4 Virtual Reception 8.5 SP4 Microsoft SQL 2019
Mitel InAttend Attendant client running on Windows 10 Enterprise	Version 2.6.4043.0

Note: The Avaya Aura® platform as well as the Mitel equipment are all running on VMware.

5. Configure Avaya Aura® Communication Manager

The configuration and verification operations illustrated in this section were all performed using Communication Manager System Administration Terminal (SAT). The information provided in this section describes the configuration of Communication Manager for this solution. For all other provisioning information such as initial installation and configuration, please refer to the product documentation in **Section 11**.

The configuration operations described in this section can be summarized as follows:

- Verify System Parameters and Features
- Configure SIP Trunk
- Configure Call Routing for InAttend
- Configure Connection to AES
- Configure VDNs and Vectors for InAttend

Note: The configuration of PSTN trunks and routes are outside the scope of these Application Notes.

5.1. Verify System Parameters and Features

Each Communication Manager system will have its own setup with different System Parameters and Features configured depending on the requirement of the customer. Here is a snapshot of some of these values that were configured on the DevConnect lab for compliance testing.

5.1.1. Verify System Parameters Customer Options

The license file installed on the system controls these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative. Use the **display system-parameters customer-options** command to determine these values. On **Page 2**, verify that **Maximum Administered SIP Trunks** has sufficient capacity. Each call answered by InAttend uses a minimum of one SIP trunk. Calls that are routed back to stations on Communication Manager or calls that are routed back to Communication Manager to access the PSTN will use two SIP trunks.

display system-parameters customer-options		Page	2 of 12
OPTIONAL FEATURES			
IP PORT CAPACITIES		USED	
Maximum Administered H.323 Trunks:		12000	250
Maximum Concurrently Registered IP Stations:		18000	2
Maximum Administered Remote Office Trunks:		12000	0
Maximum Concurrently Registered Remote Office Stations:		18000	0
Maximum Concurrently Registered IP eCons:		414	0
Max Concur Registered Unauthenticated H.323 Stations:		100	0
Maximum Video Capable Stations:		18000	0
Maximum Video Capable IP Softphones:		18000	0
Maximum Administered SIP Trunks:		24000	319
Maximum Administered Ad-hoc Video Conferencing Ports:		24000	0

On **Page 4**, ensure that both **ARS** and **ARS/AAR Partitioning** are set to **y**.

5.1.2. Configure System Features

For the testing, **Trunk-to Trunk Transfer** was set to **all** on **Page 1** of the **system-parameters features** page. This is a system wide setting that allows calls to be routed from one trunk to another and is usually turned off to help prevent toll fraud. An alternative to enabling this feature on a system wide basis is to control it using COR (Class of Restriction). See **Section 11** for supporting documentation.

display system-parameters features	Page 1 of 19
FEATURE-RELATED SYSTEM PARAMETERS	
Self Station Display Enabled? n	
Trunk-to-Trunk Transfer: all	
Automatic Callback with Called Party Queuing? n	
Automatic Callback - No Answer Timeout Interval (rings): 3

Protocol for Caller ID Analog Terminals: Bellcore	
Display Calling Number for Room to Room Caller ID Calls? n	

5.2. Configure SIP Trunk

In the **Node Names IP** form, note the IP Address of the processor interface of Communication Manager (**procr**) and the Session Manager (**sm101x**). The host names will be used throughout the other configuration screens of Communication Manager and Session Manager. Type **display node-names ip** to show all the necessary node names.

display node-names ip	Page 1 of 2
IP NODE NAMES	
Name	IP Address
sm101x	10.10.40.12
aespri101x	10.10.40.16
aessec101x	10.10.40.46
g450	10.10.40.15
procr	10.10.40.13

In the **IP Network Region** form, the **Authoritative Domain** field is configured to match the domain name configured on Session Manager in **Section 6.1.1**. In this configuration, the domain name is **greanep.sil6.avaya.com**. The **IP Network Region** form also specifies the **IP Codec Set** to be used. This codec set will be used for calls routed over the SIP trunk to Session manager as **ip-network region 1** is specified in the SIP signaling group.

display ip-network-region 1		Page 1 of 20
IP NETWORK REGION		
Region: 1

In the **IP Codec Set** form, select the audio codecs supported for calls routed over the SIP trunk to InAttend. The form is accessed via the **change ip-codec-set n** command. Note that IP codec set 1 was specified in IP Network Region 1 shown above. Multiple codecs may be specified in the **IP Codec Set** form in order of preference; the example below includes **G.711A** (a-law), which is supported by InAttend. Note the **Media Encryption** includes a setting of **none** to allow for unencrypted media.

change ip-codec-set 1		Page 1 of 2

Prior to configuring a SIP trunk group for communication with Session Manager, a SIP signaling group must be configured. Configure the Signaling Group form shown below as follows:

- Set the **Group Type** field to **sip**.
- Set the **Transport Method** to the appropriate setting, in this case it was set to **tls**.
- The **Peer Detection Enabled** field should be set to **y** allowing the Communication Manager to automatically detect if the peer server is a Session Manager.
- Specify the node names for the procr and the Session Manager node name as the two ends of the signaling group in the **Near-end Node Name** field and the **Far-end Node Name** field, respectively. These values are taken from the **IP Node Names** form shown above.
- Set the **Near-end Node Name** to **procr**. This value is taken from the **IP Node Names** form shown above.
- Set the **Far-end Node Name** to the node name defined for the Session Manager (node name **sm101x**).
- Ensure that the recommended TLS port value of **5062** is configured in the **Near-end Listen Port** and the **Far-end Listen Port** fields.
- In the **Far-end Network Region** field, enter the IP Network Region configured above. This field logically establishes the **far-end** for calls using this signaling group as network region 1.
- **Far-end Domain** was set to the domain used during compliance testing.
- The **DTMF over IP** field should remain set to the default value of **rtp-payload**. This value enables Communication Manager to send DTMF transmissions using RFC 2833.
- The **Direct IP-IP Audio Connections** field is set to **y**.
- **Initial IP-IP Direct Media** is set to **n**.
- The default values for the other fields may be used.

change signaling-group 1		Page 1 of 2

Configure the **Trunk Group** form as shown below. This trunk group is used for calls to and from InAttend. Enter a descriptive name in the **Group Name** field. Set the **Group Type** field to **sip**. Enter a **TAC** code compatible with the Communication Manager dial plan. Set the **Service Type** field to **tie**. Specify the signaling group associated with this trunk group in the **Signaling Group** field and specify the **Number of Members** supported by this SIP trunk group. Accept the default values for the remaining fields.

change trunk-group 1		Page 1 of 4

5.3. Configure Call Routing for InAttend

For compliance testing, all calls beginning with 450 with a total length of 4 digits were to be sent across the SIP trunk to Session Manager and on to InAttend. To achieve this, automatic alternate routing (aar) would be used to route the calls.

5.3.1. Administer Dial Plan

It was decided for compliance testing that all calls beginning with 4 with a total length of 4 digits were to be sent across the SIP trunk to Session Manager. Type **change dialplan analysis**, to make changes to the dial plan. Ensure that **4** is added with a **Total Length** of **4** and a **Call Type** of **udp**.

change dialplan analysis								
DIAL PLAN ANALYSIS TABLE								
Location: all								
Percent Full: 2								
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type
1	4	ext						
2	4	ext						
3	4	udp						
4	4	udp						
8	1	fac						
9	1	fac						
*	3	fac						

5.3.2. Administer Route Selection for InAttend Calls

As digits **4xxx** were defined in the dial plan as udp (**Section 5.3.1**), use the **change uniform-dialplan** command to configure the routing of the dialed digits. In the example below calls to numbers beginning with **450** that are **4** digits in length will be matched. No further digits are deleted or inserted. Calls are sent to **aar** for further processing.

change uniform-dialplan 4								
UNIFORM DIAL PLAN TABLE								
Percent Full: 0								
Matching Pattern	Len	Del	Insert Digits	Net	Conv	Node Num		
450	4	0		aar	n			
					n			

Use the **change aar analysis x** command to further configure the routing of the dialed digits. Calls to InAttend begin with **450** and are matched with the AAR entry shown below. Calls are sent to **Route Pattern 1**, which contains the outbound SIP Trunk Group.

change aar analysis 4							Page	1 of	2
AAR DIGIT ANALYSIS TABLE									
Location: all							Percent Full: 1		
Dialed	Total		Route	Call	Node	ANI			
String	Min	Max	Pattern	Type	Num	Reqd			
450	4	4	1	lev0		n			

Use the **change route-pattern n** command to add the SIP trunk group to the route pattern that AAR selects. In this configuration, **Route Pattern Number 1** is used to route calls to trunk group (**Grp No**) **1**. This is the SIP Trunk configured in **Section 5.2**.

change route-pattern 1										Page	1 of	4

6:	y	y	y	y	y	n	n	rest				none

5.4. Configure Connection to Avaya Aura® Application Enablement Services

It is assumed that a connection to AES is already in place and that the TSAPI connection and switch connection between Communication Manager and AES is fully working. The following section outlines the connection that was setup for compliance testing.

5.4.1. Note procr IP Address for Avaya Aura® Application Enablement Services Connectivity

Display the IP addresses by using the command **display node-names ip** and noting the IP address for the **procr** and the AES.

display node-names ip		Page	1	of	2
		IP NODE NAMES			
Name	IP Address				
sm101x	10.10.40.12				
aespri101x	10.10.40.16				
aessec101x	10.10.40.46				
g450	10.10.40.15				
procr	10.10.40.13				

5.4.2. Configure Transport Link for Avaya Aura® Application Enablement Services Connectivity

To administer the transport link to AES, use the **change ip-services** command. On **Page 1** add an entry with the following values:

- **Service Type:** Should be set to **AESVCS**
- **Enabled:** Set to **y**
- **Local Node:** Set to the node name assigned for the procr in **Section 5.4.1**
- **Local Port:** Retain the default value of **8765**

change ip-services				Page	1	of	3
				IP SERVICES			
Service Type	Enabled	Local Node	Local Port	Remote Node	Remote Port		
AESVCS	y	procr	8765				

Go to **Page 3** of the **ip-services** form and enter the following values:

- **AE Services Server:** Name obtained from the AES server, in this case **aespri101x**.
- **Password:** Enter a password to be administered on the AES server.
- **Enabled:** Set to **y**.

Note: The password entered for **Password** field must match the password on the AES server in **Section 7.2**. The **AE Services Server** must match the administered name for the AES server; this is created as part of the AES installation and can be obtained from the AES server by typing **uname -n** at the Linux command prompt.

change ip-services				Page 3 of 3
AE Services Administration				
Server ID	AE Services Server	Password	Enabled	Status

5.4.3. Configure CTI Link for TSAPI Service

Add a CTI link using the **add cti-link n** command, where n is the n is the cti-link number as shown in the example below this is **1**. Enter an available extension number in the **Extension** field. Enter **ADJ-IP** in the **Type** field, and a descriptive name in the **Name** field. Default values may be used in the remaining fields.

```
add cti-link 1                                     Page    1 of   3  
CTI Link: 1                                         CTI LINK  
Extension: 1990  
Type: ADJ-IP  
  
COR: 1  
Name: aespri101x
```

5.5. Configure VDNs and Vectors for InAttend

There are two VDNs and two Vectors that need to be added to allow InAttend set the status of a user on Communication Manager using TSAPI. VDN one calls on Vector one which collects digits into VDN two which is monitored by InAttend as per **Section 8.5**.

5.5.1. Adding VDNs

There are two VDNs that are added one to collect digits and one to monitor the collected digits. Use the command **add vdn x**, where x is the vdn to be added. Each VDN uses a Vector which are outlined in **Section 5.5.2**.

```
add vdn 1082                                     Page 1 of 3
                                         VECTOR DIRECTORY NUMBER
      Extension: 1082                               Unicode Name? n
      Name*: Diversion CMG
      Destination: Vector Number                22
      Attendant Vectoring? n
      Meet-me Conferencing? n
      Allow VDN Override? n
      COR: 1
      TN*: 1
      Measured: none      Report Adjunct Calls as ACD*? n

      VDN of Origin Annc. Extension*:
      1st Skill*:
      2nd Skill*:
      3rd Skill*:
SIP URI:
* Follows VDN Override Rules
```

Same command is used to **add VDN 1084** and this will use Vector **21**. This VDN is then referenced in **Section 8.5**.

```
add vdn 1084                                     Page 1 of 3
                                         VECTOR DIRECTORY NUMBER
      Extension: 1084                               Unicode Name? n
      Name*: Hangup
      Destination: Vector Number                21
      Attendant Vectoring? n
      Meet-me Conferencing? n
      Allow VDN Override? n
      COR: 1
      TN*: 1
      Measured: none      Report Adjunct Calls as ACD*? n

      VDN of Origin Annc. Extension*:
      1st Skill*:
      2nd Skill*:
      3rd Skill*:
SIP URI:
* Follows VDN Override Rules
```

5.5.2. Adding Vectors

VDN 1082 on the previous page uses this **Vector 22** to collect up to **8 digits** and then routes the call to the other VDN 1084 configured again on the previous page in **Section 5.5.1**.

```
change vector 22                                     Page 1 of 6
                                                    CALL VECTOR

  Number: 22                      Name: Diversion CMG
Multimedia? n      Attendant Vectoring? n      Meet-me Conf? n      Lock? n
  Basic? y      EAS? y      G3V4 Enhanced? y      ANI/II-Digits? y      ASAI Routing? y
  Prompting? y      LAI? y      G3V4 Adv Route? y      CINFO? y      BSR? y      Holidays? y
  Variables? y      3.0 Enhanced? y
01 wait-time      0      secs hearing ringback
02 collect      8      digits after announcement none      for none
03 wait-time      2      secs hearing ringback
04 route-to      number 1084                        cov n if unconditionally
05
06
07
08
09
10
```

VDN 1084 uses the following Vector which simply provides **ringback** to the user while the VDN is being monitored.

```
change vector 21                                     Page 1 of 6
                                                    CALL VECTOR

  Number: 21                      Name: Diversion 2

6. Configuring Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager to add the SIP Entity and routing to allow calls route to and from Mitel InAttend. Session Manager is configured via System Manager. The procedures include the following areas:

- Domains and Locations
- Configure SIP Entity
- Configure Entity Link
- Configure Routing Policy
- Configure Dial Pattern

To make changes on Session Manager a web session is established to System Manager. Log into System Manager by opening a web browser and navigating to <https://<System Manager FQDN>/SMGR>. Enter the appropriate credentials for the **User ID** and **Password** and click on **Log On**.

System Manager

Not secure | <https://10.10.40.10/network-login/>

Recommended access to System Manager is via FQDN.
[Go to central login for Single Sign-On](#)

If IP address access is your only option, then note that authentication will fail in the following cases:

- First time login with "admin" account
- Expired/Reset passwords

Use the "Change Password" hyperlink on this page to change the password manually, and then login.

Also note that single sign-on between servers in the same security domain is not supported when accessing via IP address.

This system is restricted solely to authorized users for legitimate business purposes only. The actual or attempted unauthorized access, use, or modification of this system is strictly prohibited.

Unauthorized users are subject to company disciplinary procedures and or criminal and civil penalties under state, federal, or other applicable domestic and foreign laws.

The use of this system may be monitored and recorded for administrative and security reasons. Anyone accessing this system expressly consents to such monitoring and recording, and is advised that if it reveals possible evidence of criminal activity, the evidence of such activity may be provided to law enforcement officials.

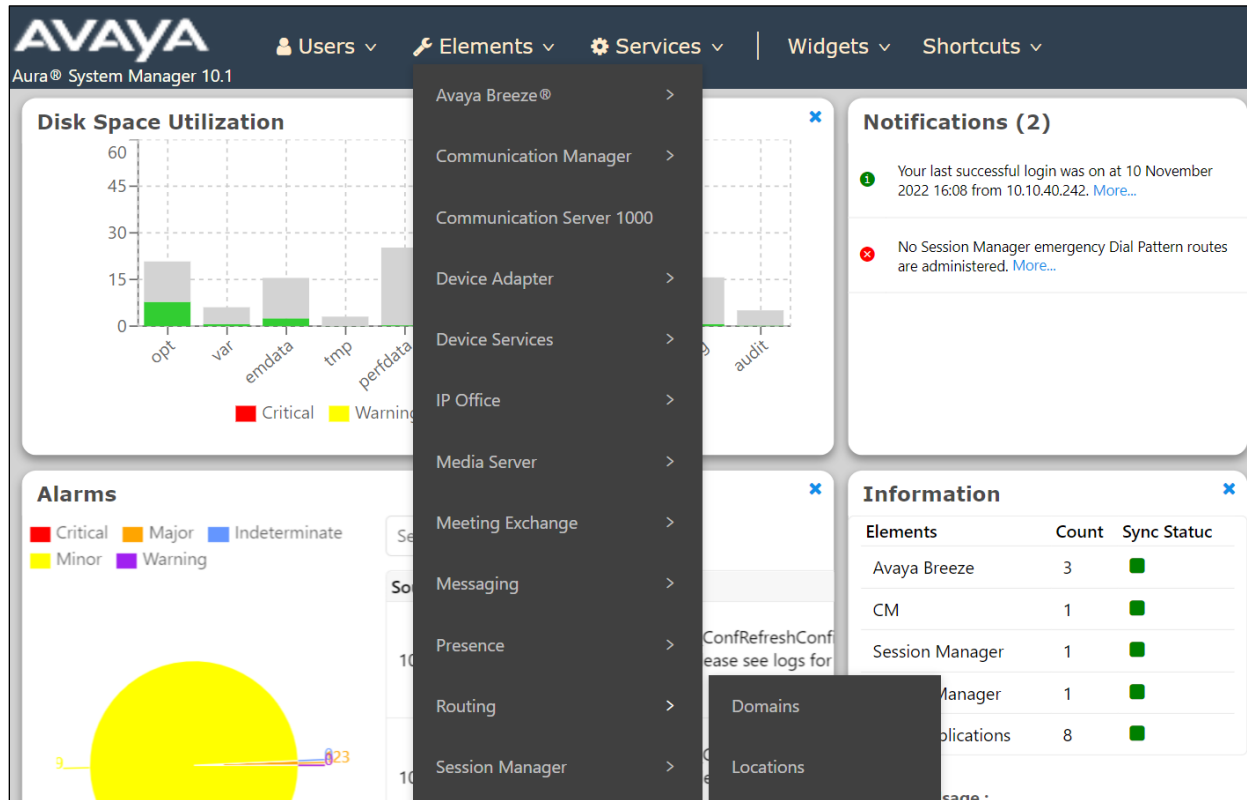

User ID:

Password:

Log On **Cancel** [Change Password](#)

Supported Browsers: Firefox (minimum version 93.0), Chrome (minimum version 91.0) or Edge (minimum version 93.0).

Once logged in navigate to **Elements** and click on **Routing**, as shown below.

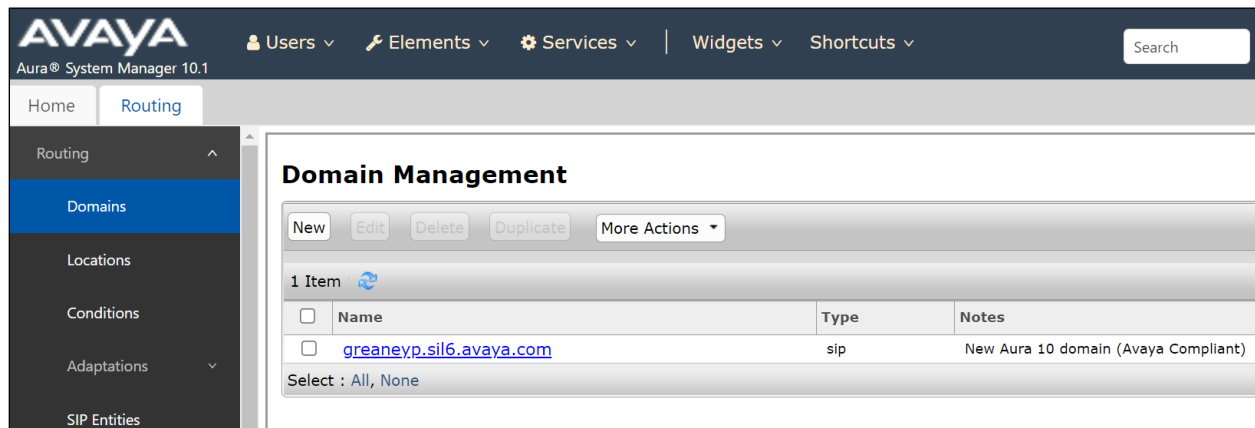

6.1. Domains and Locations

Note: It is assumed that a domain and a location have already been configured, therefore a quick overview of the domain and location that was used in compliance testing is provided here.

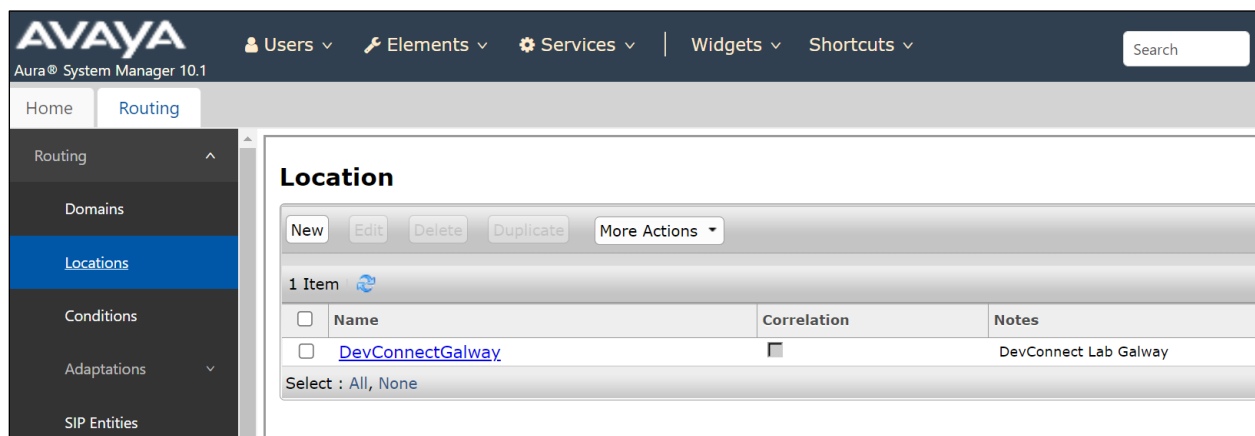

6.1.1. Display the Domain

Select **Domains** from the left window. This will display the domain configured on Session Manager. For compliance testing this domain was **greanep.sil6.avaya.com** as shown below. If a domain is not already in place, click on **New**. This will open a new window (not shown) where the domain can be added.

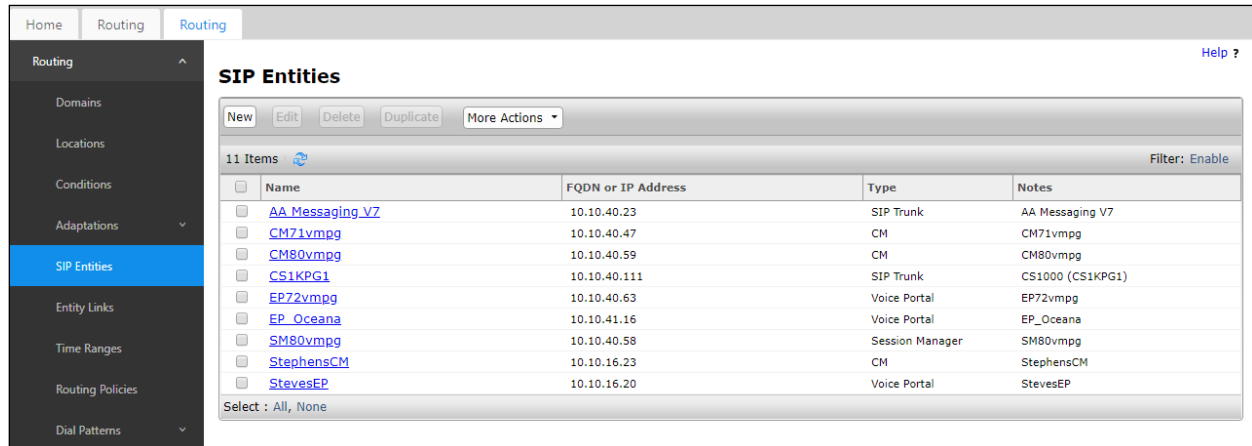

6.1.2. Display the Location

Select **Locations** from the left window and this will display the location setup. The example below shows the location **DevConnectGalway** which was used for compliance testing. If a location is not already in place, then one must be added to include the IP address range of the Avaya solution. Click on **New** to add a new location.

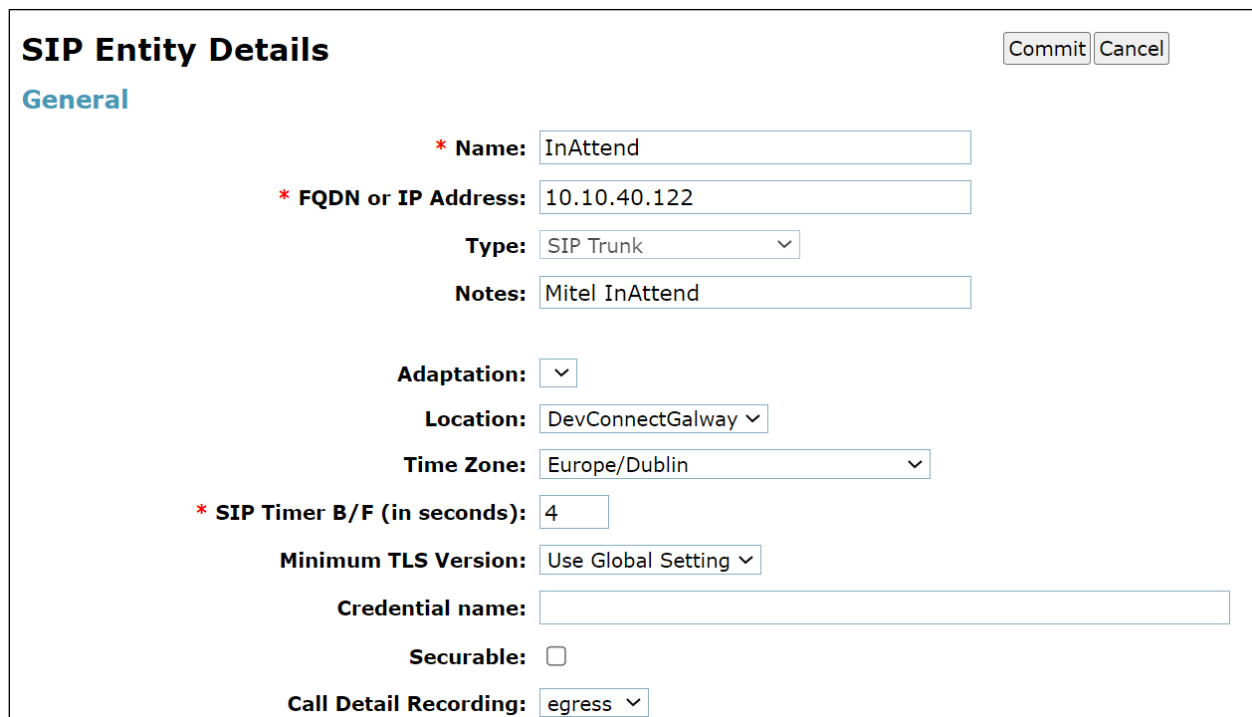

6.2. Configure Mitel InAttend SIP Entity

The ACS (also referred to as InAttend) is added on Session Manager as a SIP Entity with an Entity Link. Every SIP endpoint that communicated over a SIP trunk would be added as such. Click on **SIP Entities** in the left column and select **New** in the right window.

Name	FQDN or IP Address	Type	Notes
AA Messaging V7	10.10.40.23	SIP Trunk	AA Messaging V7
CM71vmppg	10.10.40.47	CM	CM71vmppg
CM80vmppg	10.10.40.59	CM	CM80vmppg
CS1KPG1	10.10.40.111	SIP Trunk	CS1000 (CS1KPG1)
EP72vmppg	10.10.40.63	Voice Portal	EP72vmppg
EP_Oceana	10.10.41.16	Voice Portal	EP_Oceana
SM80vmppg	10.10.40.58	Session Manager	SM80vmppg
StephensCM	10.10.16.23	CM	StephensCM
StevesEP	10.10.16.20	Voice Portal	StevesEP

Enter a suitable **Name** for the new SIP Entity and the **IP Address** of the ACS. Enter the correct **Time Zone** and **Location** and scroll down to SIP Entity Links.

6.5. Configure Mitel InAttend Dial Pattern

Select **Dial Patterns** in the left window and select **New** in the main window.

Pattern	Min	Max	Emergency Call	Emergency Type	Emergency Priority	SIP Domain	Notes
160	4	4	<input type="checkbox"/>			greanep.sil6.avaya.com	ToEP810
3	4	4	<input type="checkbox"/>			greanep.sil6.avaya.com	3xxx route to CM101x
3201	4	4	<input type="checkbox"/>			greanep.sil6.avaya.com	To NovaAlert
3539173	11	11	<input type="checkbox"/>			greanep.sil6.avaya.com	To CM101x from SIM PSTN
3539184	11	11	<input type="checkbox"/>			greanep.sil6.avaya.com	To Simulated PSTN
5	4	4	<input type="checkbox"/>			-ALL-	To IP Office SE
6667	4	4	<input type="checkbox"/>			greanep.sil6.avaya.com	To Messaging2019 on Win 2019
68	4	4	<input type="checkbox"/>			greanep.sil6.avaya.com	To AACC
95	5	5	<input type="checkbox"/>			-ALL-	ToCM10

Enter the required digits for the Routing Pattern, in the example below **450** is used. This ensures that when 450x is dialled it will route to the ACS. Enter the appropriate domain for **SIP Domain** in this example the domain created in **Section 6.1.1** is added. Click on **Add** under **Originating Locations and Routing Policies** to select this Routing Policy.

Originating Location Name	Originating Location Notes	Routing Policy Name	Rank	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes

Select the **Originating Location**, this will be the location added in **Section 6.1.2** and select the newly created Routing Policy for InAttend.

7. Configure Avaya Aura® Application Enablement Services

This section provides the procedures for configuring Application Enablement Services (AES).

The procedures fall into the following areas:

- Verify Licensing
- Switch Connection
- Administer TSAPI Link
- Identify Tlinks
- Enable TSAPI Ports
- Create CTI User
- Configure Security
- Restart AE Server

7.1. Verify Licensing

To access the AES Management Console, enter **https://<ip-addr>** as the URL in an Internet browser, where <ip-addr> is the IP address of the AES. At the login screen displayed, log in with the appropriate credentials and then select the **Login** button.

The screenshot shows the Avaya Application Enablement Services Management Console login interface. At the top left is the Avaya logo. To its right, the text "Application Enablement Services" and "Management Console" is displayed. A red horizontal bar spans the width of the page, with a "Help" link on the right. Below this bar is a login box with the text "Please login here:" and "Username" followed by a text input field. A "Continue" button is located below the input field. At the bottom of the page, a red horizontal bar is present, and below it, the copyright notice "Copyright © 2009-2022 Avaya Inc. All Rights Reserved." is displayed.

The Application Enablement Services Management Console appears displaying the **Welcome to OAM** screen (not shown). Select **AE Services** and verify that the TSAPI Service is licensed by ensuring that **TSAPI Service** is in the list of **Services** and that the **License Mode** is showing **NORMAL MODE**. If not, contact an Avaya support representative to acquire the appropriate license.

The screenshot shows the 'AE Services' management console. The left sidebar contains a navigation menu with options: AE Services, CVLAN, DLG, DMCC, SMS, TSAPI, TWS, Communication Manager Interface, High Availability, Licensing, Maintenance, Networking, Security, Status, User Management, Utilities, and Help. The 'Licensing' option is selected. The main content area displays the 'AE Services' status. It includes an important note: 'IMPORTANT: AE Services must be restarted for administrative changes to fully take effect. Changes to the Security Database do not require a restart.' Below this is a table with the following data:

Service	Status	State	License Mode	Cause*
ASAI Link Manager	N/A	Running	N/A	N/A
CVLAN Service	OFFLINE	Running	N/A	N/A
DLG Service	OFFLINE	Running	N/A	N/A
DMCC Service	ONLINE	Running	NORMAL MODE	N/A
TSAPI Service	ONLINE	Running	NORMAL MODE	N/A
Transport Layer Service	N/A	Running	N/A	N/A
AE Services HA	Not Configured	N/A	N/A	N/A

Below the table, there is a note: 'For status on actual services, please use [Status and Control](#)'. A footnote states: '* -- For more detail, please mouse over the Cause, you'll see the tooltip, or go to help page.' At the bottom, 'License Information' states: 'You are licensed to run Application Enablement (CTI) release 8.x'.

The TSAPI licenses are user licenses issued by the Web License Manager to which the Application Enablement Services server is pointed to. From the left window open **Licensing** and click on **WebLM Server Access** as shown below.

The screenshot shows the 'Licensing' management console. The left sidebar contains a navigation menu with options: AE Services, Communication Manager Interface, High Availability, Licensing, WebLM Server Address, WebLM Server Access, Reserved Licenses, Maintenance, Networking, Security, Status, User Management, Utilities, and Help. The 'Licensing' option is selected. The main content area displays the 'Licensing' page. It includes the following text:

If you are setting up and maintaining the WebLM, you need to use the following:

- WebLM Server Address

If you are importing, setting up and maintaining the license, you need to use the following:

- WebLM Server Access

If you want to administer TSAPI Reserved Licenses or DMCC Reserved Licenses, you need to use the following:

- Reserved Licenses

NOTE: Please disable your pop-up blocker if you are having difficulty with opening this page

The following screen shows the available licenses for **TSAPI** users.

AgentEvents: EXT_CITFNT_001, . . .	Not counted

7.2. Create Switch Connection

Typically, the connection between the Application Enablement Services and Communication Manager is setup as part of the initial installation and would not usually be outlined in these Application Notes. From the AES Management Console navigate to **Communication Manager Interface → Switch Connections**, the connection to Communication Manager should be present as shown below but if one is not present one can be added by clicking on **Add Connection**.

The screenshot shows the Avaya Application Enablement Services Management Console. The top header includes the Avaya logo, the title "Application Enablement Services Management Console", and a welcome message for user "cust" with login details. The left sidebar contains a navigation menu with options like "AE Services", "Communication Manager Interface", "Switch Connections", "Dial Plan", "High Availability", "Licensing", "Maintenance", and "Networking". The main content area is titled "Switch Connections" and features a table with columns: "Connection Name", "Processor Ethernet", "Msg Period", and "Number of Active Connections". A table entry for "cm101x" is shown with "Yes" for Processor Ethernet, "30" for Msg Period, and "1" for Number of Active Connections. Below the table are buttons for "Edit Connection", "Edit PE/CLAN IPs", "Edit Signalling Details", "Delete Connection", and "Survivability Hierarchy".

Connection Name	Processor Ethernet	Msg Period	Number of Active Connections
cm101x	Yes	30	1

In the resulting screen enter the **Switch Password**; the Switch Password must be the same as that entered into Communication Manager AE Services Administration screen via the **change ip-services** command, described in **Section 5.4.2. Secure H323 Connection** was left unticked, as shown below. Click **Apply** to save changes.

The screenshot shows the "Connection Details - cm101x" form in the Avaya Application Enablement Services Management Console. The form includes fields for "Switch Password" and "Confirm Switch Password", both masked with dots. The "Msg Period" is set to "30" minutes. There are checkboxes for "Provide AE Services certificate to switch" (checked), "Secure H323 Connection" (unchecked), "Processor Ethernet" (checked), and "Enable TLS Certificate Validation" (unchecked). The form ends with "Apply" and "Cancel" buttons.

Field	Value
Switch Password
Confirm Switch Password
Msg Period	30 Minutes (1 - 72)
Provide AE Services certificate to switch	<input checked="" type="checkbox"/>
Secure H323 Connection	<input type="checkbox"/>
Processor Ethernet	<input checked="" type="checkbox"/>
Enable TLS Certificate Validation	<input type="checkbox"/>

From the **Switch Connections** screen, select the radio button for the recently added switch connection and select the **Edit PE/CLAN IPs** button (not shown), see screen at the bottom of the previous page. In the resulting screen, enter the IP address of the procr, as shown in **Section 5.4.1**, that will be used for the AES connection and select the **Add/Edit Name or IP** button.

7.3. Administer TSAPI link

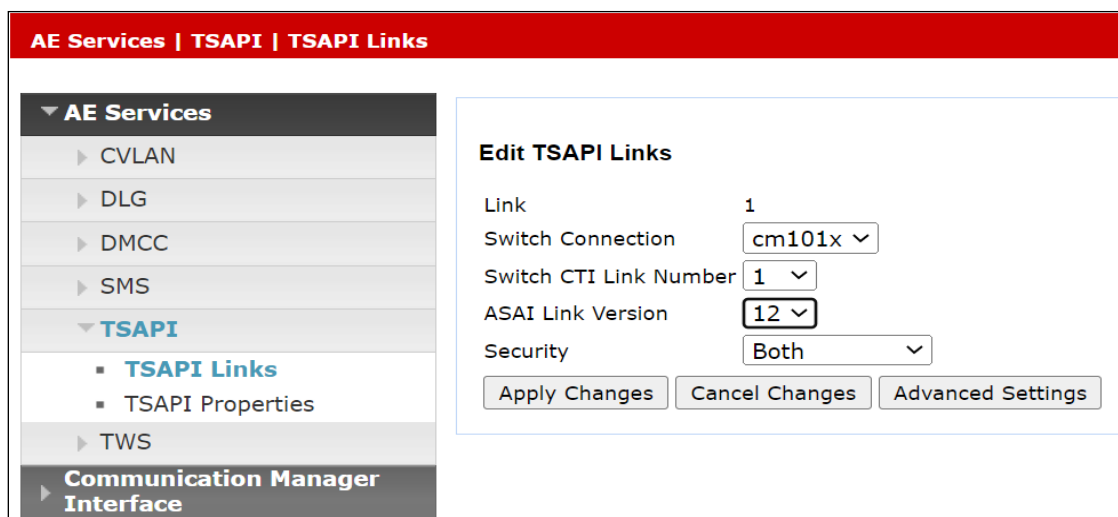

From the Application Enablement Services Management Console, select **AE Services** → **TSAPI** → **TSAPI Links**. Select **Add Link** button as shown in the screen below.

On the **Add TSAPI Links** screen (or the **Edit TSAPI Links** screen to edit a previously configured TSAPI Link as shown below), enter the following values:

- **Link:** Use the drop-down list to select an unused link number.
- **Switch Connection:** Choose the switch connection **cm101x**, which has already been configured in **Section 7.2** from the drop-down list.
- **Switch CTI Link Number:** Corresponding CTI link number configured in **Section 5.4.3** which is **1**.
- **ASAI Link Version:** **12** was used for compliance testing but the latest version available can be chosen).
- **Security:** This can be left at the default value of **Both**.

Once completed, select **Apply Changes**.

Another screen appears for confirmation of the changes made. Choose **Apply**.

Apply Changes to Link

Warning! Are you sure you want to apply the changes?
These changes can only take effect when the TSAPI server restarts.

 **Please use the Maintenance -> Service Controller page to restart the TSAPI server.**

When the TSAPI Link is completed, it should resemble the screen below.

TSAPI Links				
Link	Switch Connection	Switch CTI Link #	ASAI Link Version	Security
<input checked="" type="radio"/> 1	cm101x	1	12	Both
<input type="button" value="Add Link"/> <input type="button" value="Edit Link"/> <input type="button" value="Delete Link"/>				

7.4. Identify Tlinks

Navigate to **Security** → **Security Database** → **Tlinks**. Verify the value of the **Tlink Name**. This will be needed to configure Mitel Collaboration Management (CMG) module in **Section 8.5**.

7.6. Create CTI User

A User ID and password needs to be configured for InAttend Server module to communicate with the Application Enablement Services server. Navigate to the **User Management** → **User Admin** screen then choose the **Add User** option.

User Management | User Admin

User Admin

User Admin provides you with the following options for managing AE Services users:

- Add User
- Change User Password
- List All Users
- Modify Default User
- Search Users

In the **Add User** screen shown below, enter the following values:

- **User Id** - This will be used by InAttend Server module in **Section 8.6**.
- **Common Name** and **Surname** - Descriptive names need to be entered.
- **User Password** and **Confirm Password** - This will be used with the InAttend Server module in **Section 8.6**.
- **CT User** - Select **Yes** from the drop-down menu.

Click on **Apply Changes** at the bottom of the screen (not shown).

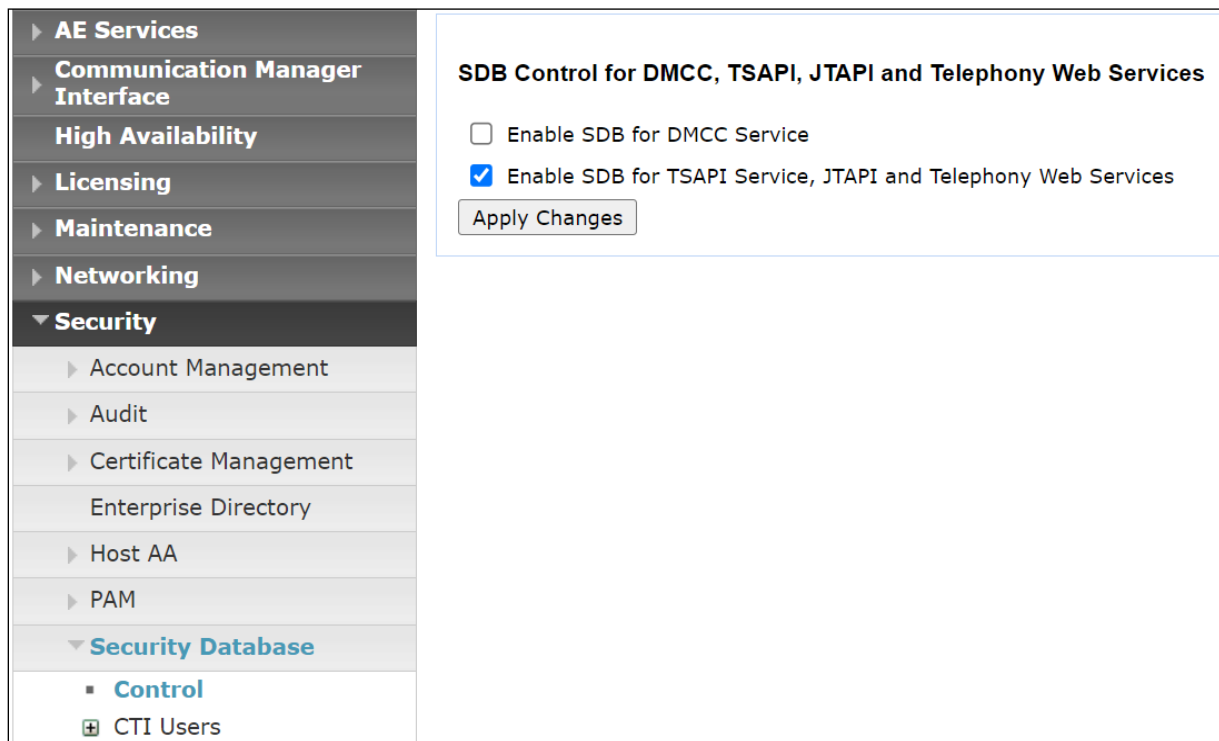

High Availability	* User Id	mitel
► Licensing	* Common Name	mitel
► Maintenance	* Surname	mitel
► Networking	User Password	••••••••
► Security	Confirm Password	••••••••
► Status	Admin Note	
▼ User Management	Avaya Role	None ▼
► Service Admin	Business Category	
▼ User Admin	Car License	
▪ Add User	CM Home

▪ List All Users	CT User	Yes ▼
▪ Modify Default Users	Department Number	
▪ Search Users	Display Name	
► Utilities	Employee Number	
► Help	Employee Type	
	Enterprise Handle	
	Given Name	
	Home Phone	
	Home Postal Address	

7.7. Configure Security

The CTI user permissions and the database security are set under **Security Database**.

7.7.1. Configure Database Control

The security database can be set differently depending on the requirements of the customer in question. For compliance testing, the DevConnect lab was setup as shown below, however this may be changed by opening **Control** and ticking the boxes shown.

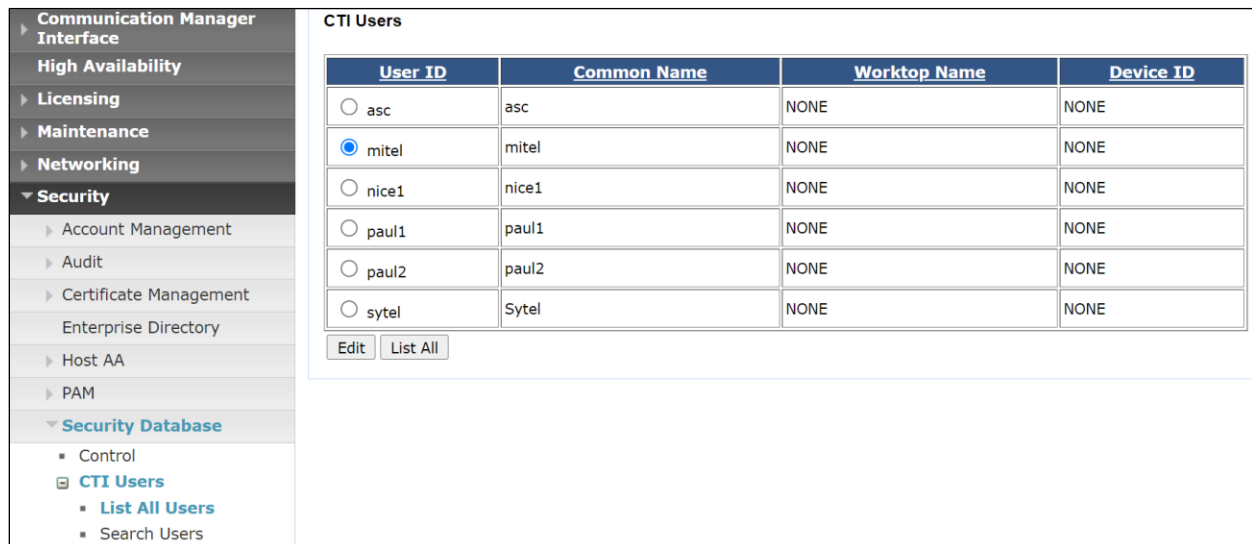

The screenshot shows a web-based configuration interface. On the left is a navigation menu with the following items: AE Services, Communication Manager Interface, High Availability, Licensing, Maintenance, Networking, Security (expanded), Account Management, Audit, Certificate Management, Enterprise Directory, Host AA, PAM, Security Database (expanded), Control (selected), and CTI Users. The main content area is titled 'SDB Control for DMCC, TSAPI, JTAPI and Telephony Web Services'. It contains two checkboxes: 'Enable SDB for DMCC Service' (unchecked) and 'Enable SDB for TSAPI Service, JTAPI and Telephony Web Services' (checked). Below the checkboxes is an 'Apply Changes' button.

Note: The AES Security Database (SDB) provides the ability to control a user's access privileges. The SDB stores information about Computer Telephony (CT) users and the devices they control. The DMCC service, the TSAPI service, and Telephony Web Services use this information for permission checking. Please look to **Section 11** for more information on this.

7.7.2. Associate Devices with CTI User

Navigate to **Security** → **Security Database** → **CTI Users** → **List All Users**. Select the CTI user added in **Section 7.6** and click on **Edit**.

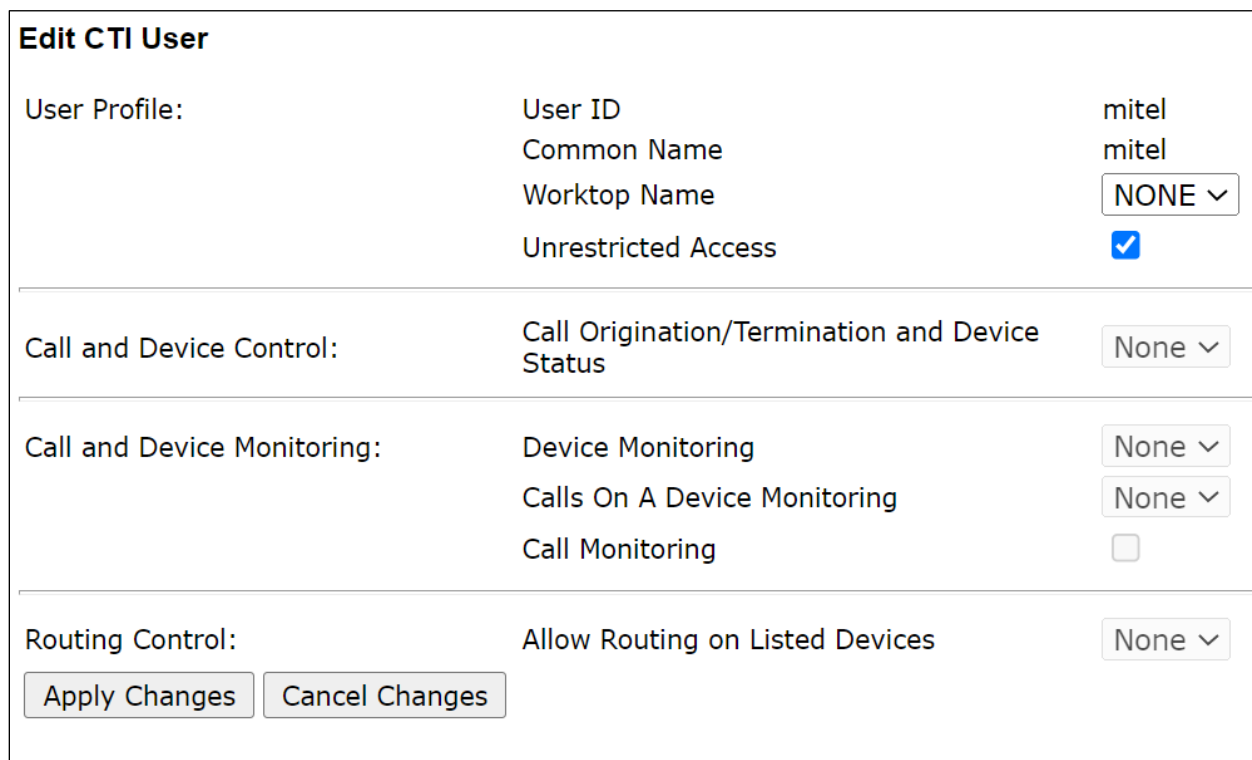

The screenshot shows the 'CTI Users' interface. On the left is a navigation menu with categories: Communication Manager Interface, High Availability, Licensing, Maintenance, Networking, and Security. Under Security, there is a 'Security Database' section containing 'Control', 'CTI Users', 'List All Users', and 'Search Users'. The 'CTI Users' section is active. The main area displays a table of users with columns: User ID, Common Name, Worktop Name, and Device ID. The 'mitel' user is selected. Below the table are 'Edit' and 'List All' buttons.

User ID	Common Name	Worktop Name	Device ID
<input type="radio"/> asc	asc	NONE	NONE
<input checked="" type="radio"/> mitel	mitel	NONE	NONE
<input type="radio"/> nice1	nice1	NONE	NONE
<input type="radio"/> paul1	paul1	NONE	NONE
<input type="radio"/> paul2	paul2	NONE	NONE
<input type="radio"/> sytel	Sytel	NONE	NONE

Edit List All

In the main window ensure that **Unrestricted Access** is ticked. Once this is done click on **Apply Changes**.

The screenshot shows the 'Edit CTI User' form. It has four sections: User Profile, Call and Device Control, Call and Device Monitoring, and Routing Control. Each section has a label, a description, and a control element (dropdown or checkbox). At the bottom are 'Apply Changes' and 'Cancel Changes' buttons.

Edit CTI User		
User Profile:	User ID	mitel
	Common Name	mitel
	Worktop Name	NONE ▾
	Unrestricted Access	<input checked="" type="checkbox"/>
Call and Device Control:	Call Origination/Termination and Device Status	None ▾
Call and Device Monitoring:	Device Monitoring	None ▾
	Calls On A Device Monitoring	None ▾
	Call Monitoring	<input type="checkbox"/>
Routing Control:	Allow Routing on Listed Devices	None ▾
<div>Apply Changes Cancel Changes</div>		

7.8. Restart AE Server

Once everything is configured correctly, it is best practice to restart AE Server (if possible), this will ensure that the new connections are brought up correctly. Click on the **Restart AE Server** button at the bottom of the screen.

8. Configure Mitel Attendant Connectivity Server (ACS)

Although a Mitel engineer will setup the solution the following sections show information on the connection to Session Manager that was used for compliance testing, it may prove useful.

8.1. Mitel Media Server configuration

All Mitel applications are run from the Windows 2019 server, click on the **Mediaserver Config**, as shown below.

These are the settings that were used for compliance testing. Take note of the **Codec Preference** as this is where they are set. Typically, these are the default settings.

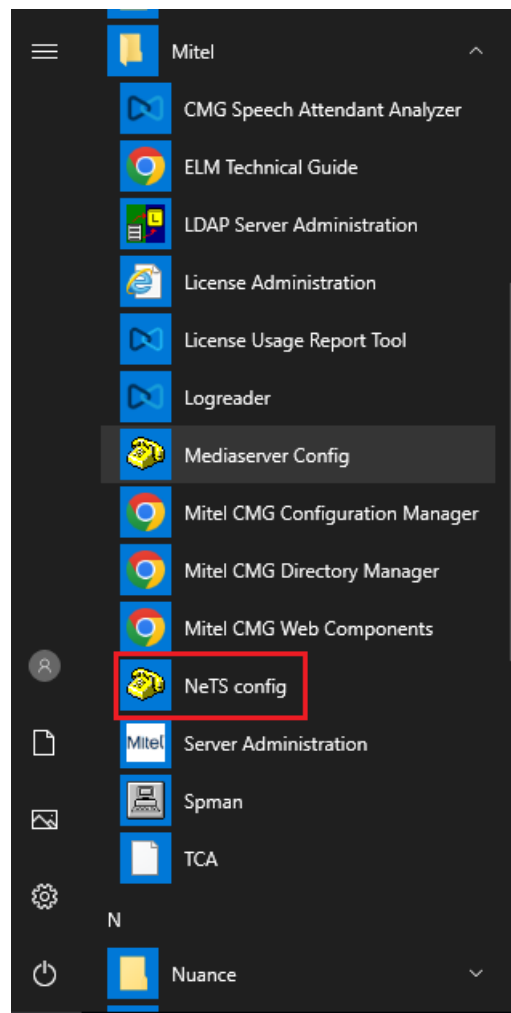

The screenshot shows the 'Media server config' window with the following settings:

- Local Media Server Properties**
 - SIP Address and Port:** :5065
 - Dialog TTL:** 10 minutes
 - RTP Port Range:** 40000 - 50000
 - RTCP:** ☐
 - MOH File:** C:\Program Files (x86)\Mitel\MediaServer\vinging.wav
 - Trim Recordings:** ☒
 - Forward DTMF into conferences:** ☐
 - Codec Preference:** g722,ilbc,pcma,pcmu,g729,g723,rfc2833,dtmf,cn,20
 - Audio Files Prefix:** C:\Program Files (x86)\Mitel\MediaServer\
 - SRTP SDP Offer:** ☐
 - Force recording 16bit, 16kHz:** ☒
 - SRTP Best Effort:** ☒
 - Cipher suites:** (empty)
 - Log Path:** C:\Program Files (x86)\Mitel\MediaServer\Logs
 - Log Level:** [3] Trace
 - Delete older than (days):** 10
 - Max size (MB):** 0
- Running Version:** 1.9.187.0
- Service Start Time:** 2022-11-09 12:01:54
- Service Status:** Running

Buttons at the bottom: Close, Apply, Ok.

8.2. Mitel NeTS configuration

Click on the **NeTS config** as shown below.

These are the settings that were used for compliance testing. The only settings that are of interest to the connection to Session Manager are found under the **SIP** tab and **Local settings**. Typically, these are the default settings.

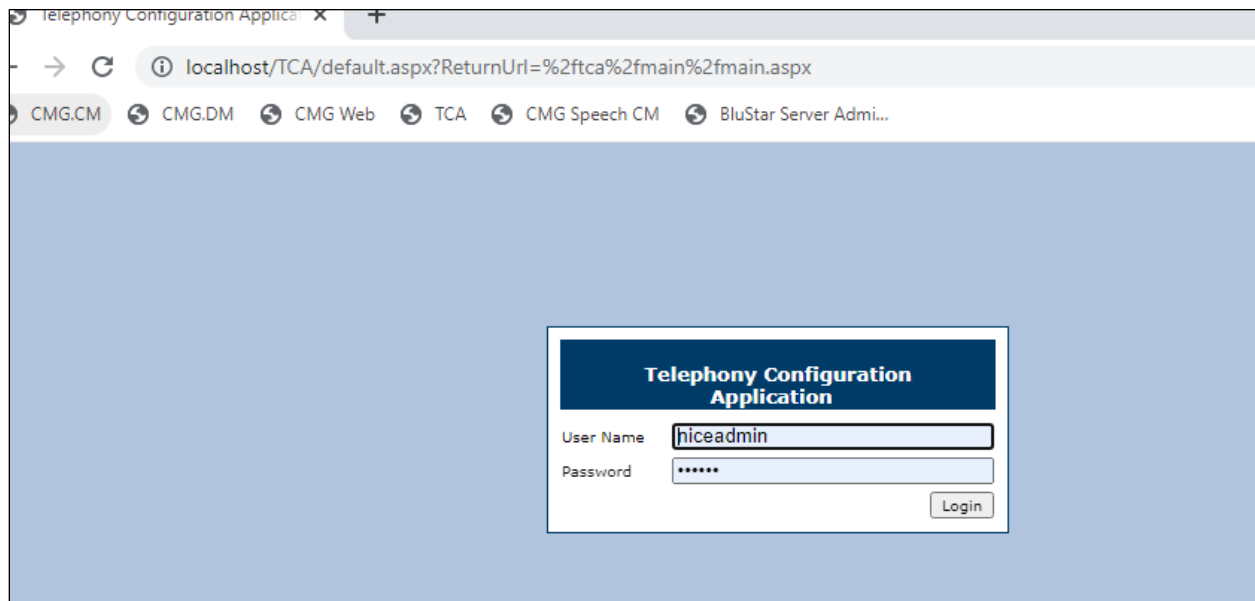

The screenshot shows the 'Network Telephony Services configuration' dialog box with the 'SIP' tab selected. The 'Local settings' section is highlighted in the left-hand menu. The main area contains the following settings:

- ☒ Use SIP
- NeTS local SIP port for media control: INATTEND:5067
- Outbound proxy: (empty text box)
- ☒ Use local IP in "From" header
- ☒ Use local IP in "Contact" header
- ☒ Follow redirects
- ☒ Use OPTIONS as to check if calls are valid
- ☒ Allow REGISTER requests
- ☐ Media-SDP in 180 Ringing
- ☒ Transfer A to B
- ☐ Hold before transfer
- ☐ Allow numbers with leading + (E.164)
- ☐ Load balance Media Servers
- PRACK support: Supported (dropdown menu)
- Option to check if SIP trunks are up. (s): 90 (spin box)
- Served-by-NeTS Header: P-Served-User (text box)
- Max wait for 100 Trying on Outbound calls. (ms): 1200 (spin box)

At the bottom of the dialog are three buttons: OK, Cancel, and Apply.

8.3. Mitel Telephony Configuration Application (TCA) configuration

Open a web browser and browse to the ACS server name followed by TCA, for example <http://<servername>/tca>. Enter the appropriate credentials and click on **Login**.

A configuration will be setup as part of the initial installation and configuration, click on that **Configuration name**, for compliance testing this was **Inattend-Avaya**.

Telephony Configuration Application

No configuration loaded

Configurations

Configurations
Click on the configuration name to work with the configuration. To create a new configuration click on the "new" symbol to the right. The chosen configuration will be the template for the new configuration. To delete a configuration, click on the trash bin to the right of the configuration. Download a file by right clicking on the source link and choosing "Save Target As..." in the popup menu.

Configuration name		Last deployed (Server local time)		
Inattend-Avaya	(source)	2022-11-09 12:57:44		
Inattend-MX	(source)	2022-11-04 08:14:57		

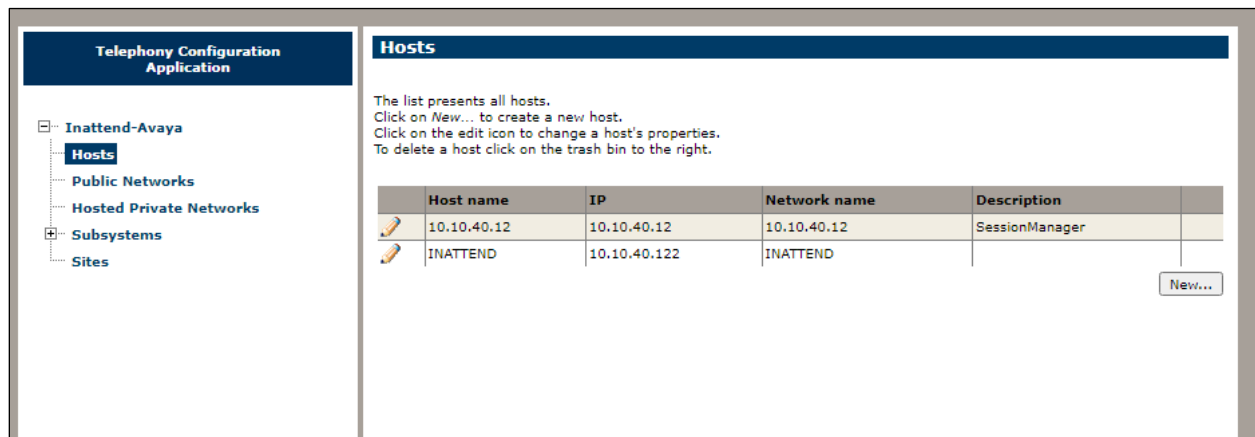

1

Templates

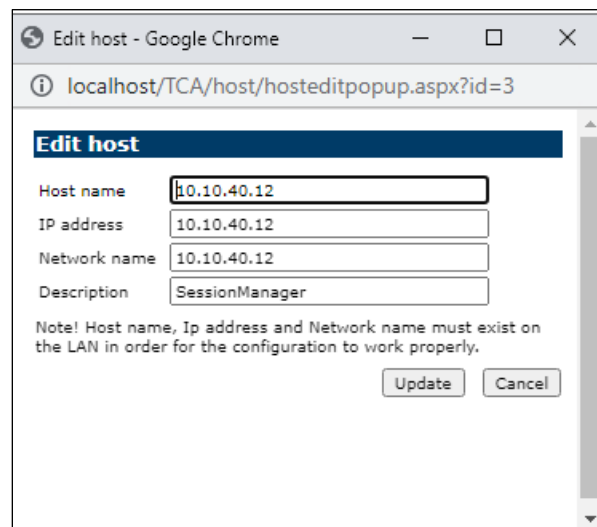

To create a new configuration from the template click on the "new" symbol to the right.

Template name	Description	
CMGVoice Without CTC - Template	CMGVoice Without CTC - Template	
CUCM SIP Template	CUCM SIP Template	
Empty Template	Empty Template	
InAttend CUCM SIP Template	InAttend CUCM SIP Template	
InAttend MX-ONE SIP Template	InAttend MX-ONE SIP Template	
Simple CUCM SIP Template	Simple CUCM SIP Template	
Single ACS Template	Single ACS Template	
Single CTC Template	Single CTC Template	
Single CTC With Queue Messages - Template	Single CTC With Queue Messages - Template	

Click into **Hosts** in the left window. The hosts below were already configured by Mitel for compliance testing and clicking on the edit icon will show more information on these hosts. A new host can be added by clicking on **New** in the main window.

Enter a suitable **Host name** and **IP address**. This will be the Session Manager Security Module (SM100) IP address, as an example **10.10.40.12** was used below.

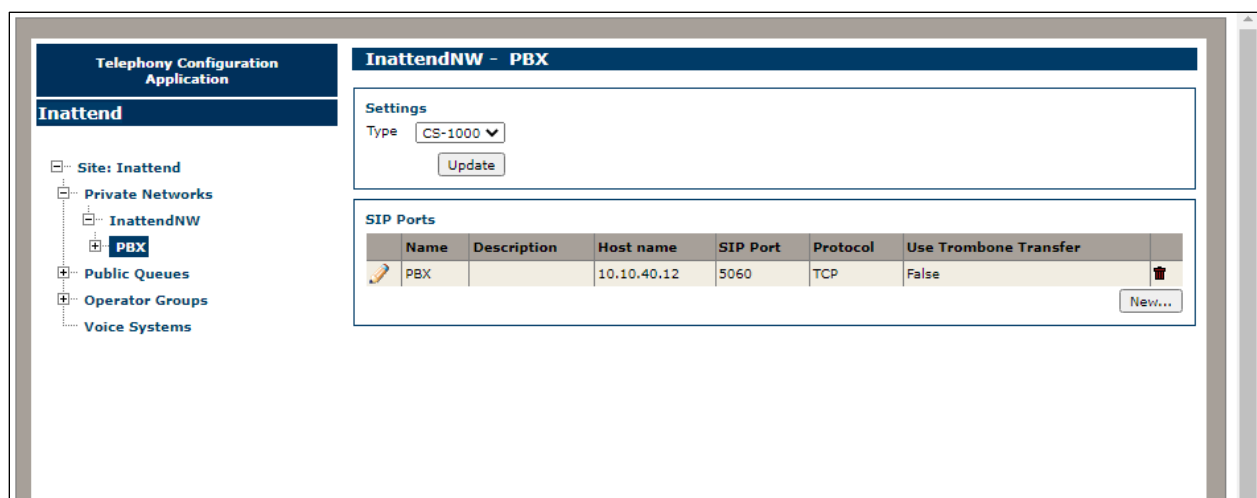

Click on **Sites** in the left window and once again a site will have been already configured during the initial setup, click on that site.

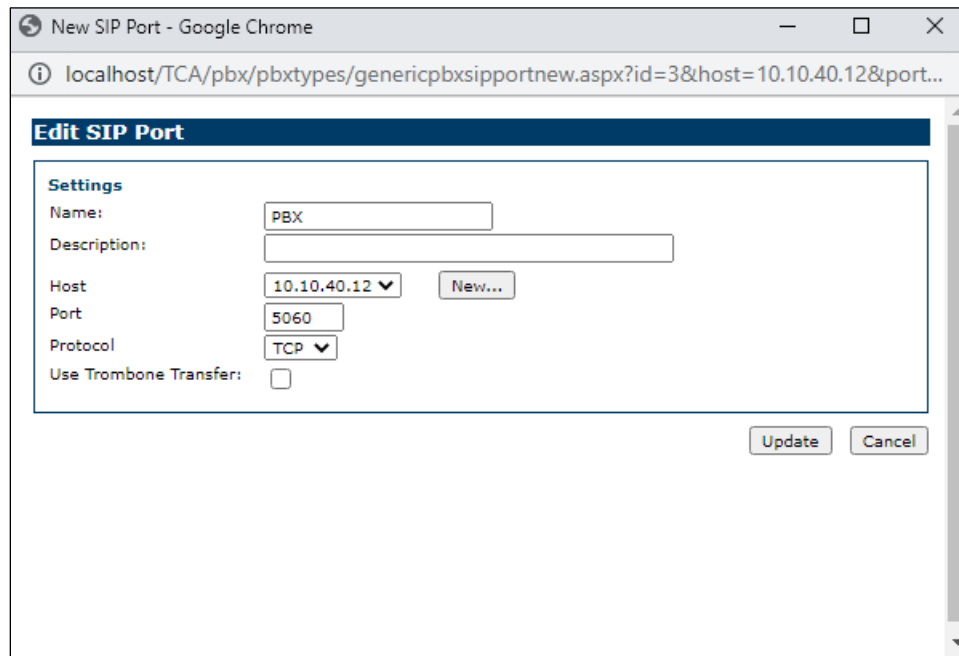

Navigate to **PBX** in the left window and click on **New** in the main window. This will create a new PBX connection. Note that the **Type** can be set to **CS-1000** before clicking on **New**.

Note: The Type being set to CS-1000 does not matter for Communication Manager, this is correct as there is no specific setting for Communication Manger and the closest is CS-1000.

Enter a suitable name and select the **Host** that was created above from the drop-down menu. The **Port** should be set to **5060** and the **Protocol** should be set to **TCP**, this will match the **Entity Link** setup in **Section 6.3**.

Note: The Protocol used can be either TCP or UDP, but it must match that setup on the Entity Link in **Section 6.3**.

The screenshot shows a web browser window titled "New SIP Port - Google Chrome". The address bar displays the URL: `localhost/TCA/pbx/pbxtypes/genericpbxsiportnew.aspx?id=3&host=10.10.40.12&port...`. The main content area is titled "Edit SIP Port" and contains a "Settings" section with the following fields:

- Name:** A text input field containing "PBX".
- Description:** An empty text input field.
- Host:** A dropdown menu showing "10.10.40.12" with a "New..." button next to it.
- Port:** A text input field containing "5060".
- Protocol:** A dropdown menu showing "TCP".
- Use Trombone Transfer:** An unchecked checkbox.

At the bottom right of the form, there are two buttons: "Update" and "Cancel".

Navigate to **Domains** in the left window and note the **SIP Domain** is entered here as per **Section 6.1.1**. Devices can be entered by clicking on the **New** button at the bottom right of the screen. This will add Communication Manager extensions that can be used for other functions that are not covered in these Application Notes.

8.4. Update the Registry on the Mitel Attendant Connectivity Server

A registry setting was added to the NeTS process on the ACS server to allow a re-invite to be sent to overcome an issue found during the following scenarios:

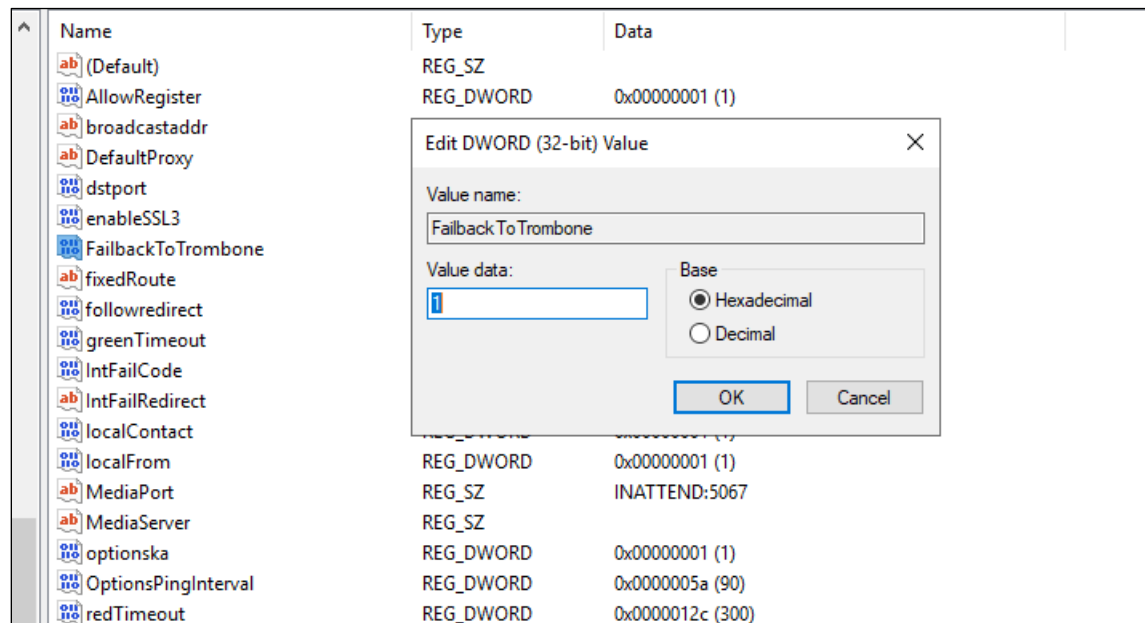

1. Caller from Communication Manager calls to the Mitel InAttend operator.
2. The operator transfers the caller to a voicemail box, 'Direct Drop' to the mailbox.

Without the update in the registry the call could not be transferred correctly. The ACS will initiate a transfer using REFER and Communication Manager sends an ACCEPT but then immediately after sends a NOTIFY message containing "481 Call Transaction does not exist". The NETS then creates a new invite with the trombone transfer and this overcomes the issue.

The registry is updated as follows. Navigate to **Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Netwise\NeTS\SIP**. In the main window, right-click anywhere on the screen and select **New → DWORD(32-bit) Value**.

Enter the name **FailbackToTrombone** as the name for the new **REG_DWORD** (not shown) and right-click on the REG_DWORD and select **Modify** as shown. Ensure that the **Value data** is set to **1** and the **Base** to **Hexadecimal**, as shown below. Click in **OK** once finished.

8.5. Configure TSAPI connection from Collaboration Management (CMG) module

Open SPMAN (show that screen shot that was taken of the Mitel folder), this is a Mitel application that reads the registry. The following screen is displayed. Changes are made to the **Additional parameters** at the bottom of the screen below. The **TSAPIVDN** is the VDN added in **Section 5.5.1**. This will be the second VDN added, the VDN that the collect digits Vector routes to. The **TSAPIUser** and **TSAPIPassword** is that of the CTI user added in **Section 7.6**.

The screenshot shows the SPMAN application window titled "Server: INATTEND DBID: 01". The window has a menu bar with "File", "Command", "WinTools", and "Help". The main area is divided into several sections:

- Program configuration:** Includes fields for "Program" (pbxstd001), "Program path" (pbxCSTA_Avaya.exe), "Parameters" (-p 1-15), "Wait" (0), "Max restarts" (16), "Start order" (0), "Enabled" (checked), and "Desktop" (unchecked).
- State and timing:** Includes "State" (Running), "Start time" (22-11-09 11:00), and "Errors" (0).
- Additional parameters:** A table with columns "Group", "Name", and "Value". The table contains one entry: "config" (Group), "TSAPIVDN" (Name), and "1084" (Value).

On the right side of the window, there are buttons for "Save", "New", "Delete", "Previous", and "Next". At the bottom, there are buttons for "Status" and "Edit".

The **TSAPITserver** information is filled in from the TLINK as shown in **Section 7.4**.

Note: The unsecure link was used for the compliance testing.

9. Verification Steps

This section provides the tests that can be performed to verify correct configuration of the Avaya and Mitel solutions.

1. Make a call to the InAttend attendant and request to be transferred to a known extension. Ensure the call is connected.
2. Make a call to the InAttend attendant and request to be transferred to a known extension which is busy and request to leave a voice message. Ensure the call is transferred to voicemail and a message can be left.
3. Make a call to the Attendant queue. Ensure the attendant receives and answers the call.

InAttend can be started from the shortcut or by navigating to the program on the client PC.

Enter the appropriate credentials and click on **Log On**.

A screenshot of the Mitel InAttend login interface. The background is dark blue. At the top left is the Mitel logo, followed by a vertical line and the text 'InAttend'. Below this, there are two input fields: 'Username' with the text 'brousk' and 'Password' with masked characters '.....'. Below the password field is a checkbox labeled 'Remember password'. At the bottom right are two buttons: 'Log On' and 'Cancel'.

Once logged in the operator will be in night mode as shown below with the red bar. Click on the icon highlighted to change this to normal operation.

Once a call is presented to the attendant the caller is shown on the attendant screen and the attendant can answer the call using the mouse or keyboard. Presence information on users beginning with 100 are shown at the bottom of the screen.

The screenshot displays the InAttend software interface. At the top, there's a 'Menu' bar with 'Call Control' selected. Below it, a toolbar contains icons for Basic, Connection, Function, and Additional Functions. A central panel shows call statistics: '1' in a box, 'Recall (0)', 'Ext (1)' in a green box, 'Int (0)', and 'Park (0)'. Below this is a table with columns: Queue, Caller, Called, Origin, Prio, Time, Reason, and Call Identifier. The first row shows: Ext, PSTN (091732000), Avaya Night (4500), int, 10, 00:04, New call, 1156.

Below the table is a large blue area with a call icon and text: 'PSTN 091732000' and 'INT Avaya Night 4500'. Below this is a search bar with '100' entered and several filter tabs: Sökord, Organization, Room, City, and Kostnadsställe. Below the search bar is a table with columns: Status, Phone, Last name, First name, Organization, Org 1, and City. The first row shows: In a call, 1000, Rousk, Björn, Market Access, 0008-008.1. The second row shows: In a call, 1001, Andersson, Mikael.

At the bottom, a status bar shows: View: The Company Ltd, Attendants: 1 / 3, ...connected..., W50 Wednesday 11 December 2019, 17:20:08.

With the call answered the caller's information is displayed and this information can be augmented with information from the InAttend database.

The screenshot displays a call center software interface. At the top, there are tabs for 'Basic', 'Connection', 'Function', and 'Additional Functions'. Below these are input fields for 'Recall (0)', 'Ext (0)', 'Int (0)', and 'Park (0)'. A table with columns 'Queue', 'Caller', 'Called', 'Origin', 'Prio', 'Time', and 'Reason' is visible. The main section shows caller information for 'Louise Finnigan' with extension '7001' and 'INT Avaya Night' with extension '4500'. Below this is a search bar with fields for 'Sökord', 'Organization', 'Room', 'City', and 'Kostnadsställe'. The 'Louise Finnigan' profile is expanded, showing a 'Details' tab with a table of contact information. The status bar at the bottom indicates 'Status', 'View: The Company Ltd', 'Attendants: 1 / 2', '...connected...', 'W6 02 February 2017', and '12:47:17'.

9.1. Verify the connection to Avaya Aura® Application Enablement Services

The following can be checked to ensure that the connections to the AES are in operation correctly.

9.1.1. Verify the link to Application Enablement Services from Communication Manager

The following steps can ensure that the communication between Communication Manager and the Application Enablement Services server is functioning correctly. Check the TSAPI link status with Application Enablement Services by using the command **status aesvcs cti-link**. Verify the **Service State** of the TSAPI link is **established**.

status aesvcs cti-link						
AE SERVICES CTI LINK STATUS						
CTI Link	Version	Mnt Busy	AE Services Server	Service State	Msgs Sent	Rcvd
1	12	no	aespri101x	established	865	865

Use the command **status aesvcs interface** to verify that the status **Local Node** of Application Enablement Services interface is connected and **listening**.

status aesvcs interface			
AE SERVICES INTERFACE STATUS			
Local Node	Enabled?	Number of Connections	Status
procr	yes	1	listening

Verify that there is a link with the Application Enablement Services and that messages are being sent and received by using the command **status aesvcs link**.

status aesvcs link						
AE SERVICES LINK STATUS						
Srvr/ Link	AE Services Server	Remote IP	Remote Port	Local Node	Msgs Sent	Rcvd
01/01	aespri101x	10.10.40.16	56722	procr	683	665

9.1.2. Verify the TSAPI Link from Application Enablement Services

On the AES Management Console, verify the status of the TSAPI link by selecting **Status** → **Status and Control** → **TSAPI Service Summary** to display the **TSAPI Link Details** screen. Verify the status of the TSAPI link by checking that the **Status** is **Talking** and the **State** is **Online**. There were six devices monitored during compliance testing and so **Associations** is showing **6** below.

TSAPI Link Details

☐ Enable page refresh every 60 seconds

Link	Switch Name	Switch CTI Link ID	Status	Since	State	Switch Version	Associations	Msgs to Switch	Msgs from Switch	Msgs Period
1	cm101x	1	Talking	Mon Nov 7 17:13:05 2022	Online	20	6	67	62	30

For service-wide information, choose one of the following:

Click in **User Status** on the screen above. A new window is displayed below showing the CTI user **Mitel** connected to receive the TSAPI events. As per **Section 1**, the Mitel InAttend solution makes use of two TSAPI connections to Application Enablement Services.

- TSAPI connection from the CMG – Used to set Call Forwarding and Message Waiting.
- TSAPI connection from the InAttend server – Used to monitor devices to provide Presence information.

CTI User Status

☐ Enable page refresh every 60 seconds

9.2. Verify the SIP Trunk connection

The SIP trunk from Communication Manager to Session Manager can be checked using the following steps.

9.2.1. Verify Avaya Aura® Communication Manager

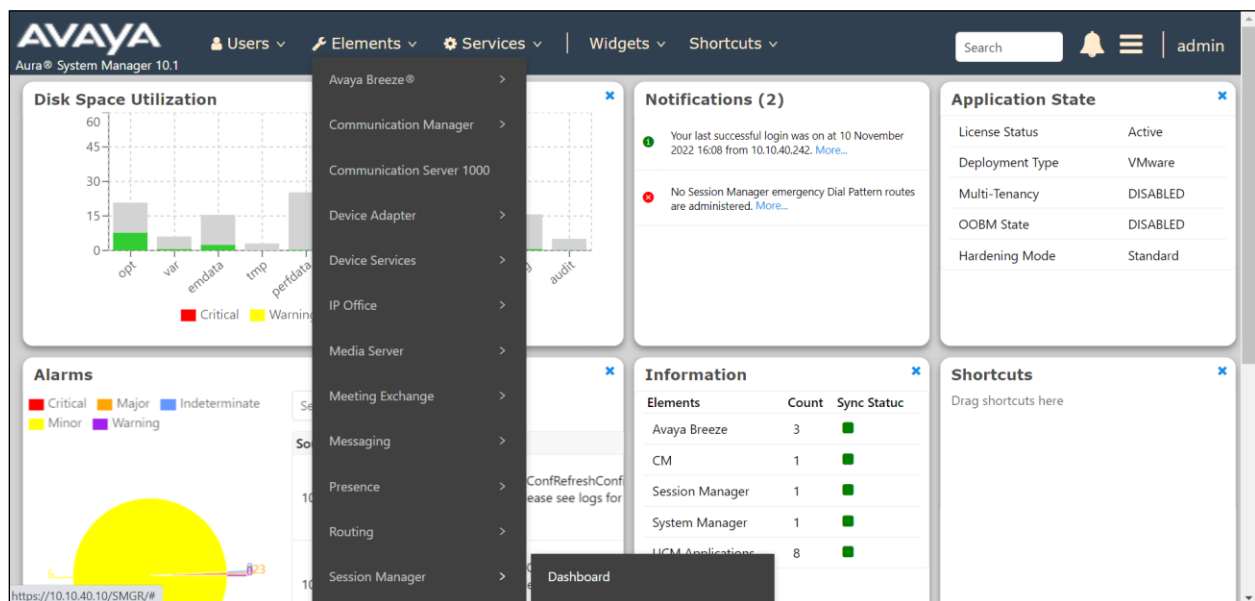

The following steps can be taken if there are any issues with calls being made. This should help verify the links between the products. From the SAT interface, verify the status of the SIP trunk groups by using the **status trunk n** command, where “n” is the trunk group number administered in **Section 5.2**. Verify that all trunks are in the **in-service/idle** state as shown below (just a sample of the trunks configured).

```
status trunk 1
```

TRUNK GROUP STATUS			
Member	Port	Service State	Mtce Connected Ports Busy
0001/0001	T00001	in-service/idle	no
0001/0002	T00002	in-service/idle	no
0001/0003	T00003	in-service/idle	no

9.2.2. Verify InAttend SIP Entity is up

Log into System Manager as per **Section 6**. Navigate to **Elements** and click on **Session Manager**.

Selected **SIP Entity Monitoring** in the left window.

Session Manager Dashboard

This page provides the overall status and health summary of each administered Session Manager.

Session Manager Instances

Service State: Shutdown System: EASG: Clear Logs: As of 3:05 PM

1 Item Show All Filter: Enable

Session Manager	Type	Tests Pass	Alarms	Security Module	Service State	Load Factor	Entity Monitoring	Active Call Count	Registrations	Data Replication	User Data Storage Status	License Mode	EASG
sm101x	Core	✓	0/0/0	Up	Accept New Service	0/0/0	2/13	0	1/1	✓	✓	Normal	Enabled

Select: All, None

Select the **InAttend** SIP Entity.

SIP Entity Monitoring

SIP Entity Name	Down	Partially Up	Up	Not Monitored
sm101x	2	0	11	0

Select: All, None

All Monitored SIP Entities

Run Monitor

13 Items

SIP Entity Name
Messaging2019
AACC
Experience Portal-MPP
InAttend
novaalert
IP Office - SE
cm101x - Phones - 5061

The SIP Entity should show as **UP** as it is shown below.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

Status Details for the selected Session Manager:

All Entity Links to SIP Entity: InAttend

Summary View

1 Item  Filter: [Enable](#)

	Session Manager Name	Session Manager IP Address Family	SIP Entity Resolved IP	Port	Proto.	Deny	Conn. Status	Reason Code	Link Status
<input type="radio"/>	sm101x	IPv4	10.10.40.122	5060	TCP	FALSE	UP	200 OK	UP

Select : [None](#)

10. Conclusion

The interoperability of Mitel InAttend using Mitel Attendant Connectivity Server V2.6 SP4 from Mitel Sweden AB to interoperate with Avaya Aura® Communication Manager R10.1 utilizing a SIP trunk connection to Avaya Aura® Session Manager R10.1 and a TSAPI connection to Avaya Aura® Application Enablement Services was successful for this specific setup to place calls to and from InAttend. All issues and observations are outlined in **Section 2.2**.
