

Avaya Solution & Interoperability Test Lab

Application Notes for Configuring Vocera Communications using TLS as the Transport Protocol with Avaya Aura® Session Manager 6.1 and Avaya Aura® Communication Manager 6.0.1 – Issue 1.0

Abstract

These Application Notes describe the procedure for configuring Vocera Communications to interoperate with Avaya Aura® Session Manager and Avaya Aura® Communication Manager.

The overall objective of the interoperability compliance testing is to verify Vocera Communications functionalities in an environment comprised of Avaya Aura® Communication Manager, Avaya Aura® Session Manager, and various Avaya endpoints including SIP, H.323 and Digital.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) Trunking utilizing Transport Layer Security (TLS) between Vocera Communications and an Avaya SIP-enabled enterprise solution. The Avaya enterprise solution consists of Avaya Aura® Communication Manager 6.0.1 and Avaya Aura® Session Manager 6.1.

Vocera Communications Solution is comprised of three main components:

- Vocera Badges
- Vocera Server
- Vocera SIP Telephony Gateway

The Vocera Badges are wireless 802.11b/g devices that serve as communicators in a wireless environment. By pressing the call button on a badge, a user can interface with the Vocera Server to start the call process. The B3000 badges have a speech zone, the region in which audio can be detected. To get the best possible speech recognition, the top of the badge should be between 6 to 8 inches (15 to 20 centimeters) directly below the mouth. Any sound coming from another direction or beyond that distance is reduced or eliminated by the noise canceling microphones. The Vocera Server acts as a communication server to service calls between the badges. The Vocera Server stores the user and Badge information, and has the speech access interface that allows users to place and receive calls.

The Vocera SIP Telephony Gateway was utilized for the test, to setup a SIP trunk between the Vocera SIP Telephony Gateway and Avaya Aura® Session Manager. The Vocera SIP Telephony Gateway allows the Vocera Server to connect Badges to Avaya Aura® Communication Manager users and extensions, as well as route calls to the public network through Avaya Aura® Communication Manager.

The two server applications, Vocera Server and Vocera SIP Telephony Gateway, can reside on the same physical server platform. Vocera recommends using multiple Vocera SIP Telephony Gateway servers and array for redundancy, especially if the VSTG will be hosted on a VM.

For additional information on Vocera Communication System, please refer to Vocera documentation (3-5).

2. General Test Approach and Test Results

The focus of the interoperability compliance testing was to verify the ability of the Vocera solution to interoperate with an Avaya SIP-enabled IP Telephony environment comprised of Session Manager, Communication Manager and various Avaya phones including SIP, H.323 and Digital.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

2.1. Interoperability Compliance Testing

The interoperability compliance test included features and serviceability. The feature testing focused on the following areas:

- Verify basic network connectivity
 - Badges to Access Point
 - SIP Trunk using TLS between Vocera and Avaya
- Basic calls (verifying proper set up and tear down of the calls), the phones and badges displayed Caller ID information, and voice paths/quality
 - Badge to Badge
 - Badge to Phone
 - Phone to Badge
- Audio codec negotiation using G.711MU and G.711A
- Voice Features
 - Call Transfer
 - Call Conference
 - Call Hold/Resume
 - Badge Emergency Broadcast all Badges
- DTMF transmission using RFC 2833

Serviceability testing focused on verifying the ability of Vocera SIP Telephony Gateway, Vocera Server and Vocera Badges to recover from adverse conditions such as network and server (e.g., Vocera, Session Manager, and Communication Manager) outages.

2.2. Test Results

All test cases were executed and passed with the following exceptions/observations noted:

- Avaya Certificate for TLS was not imported into the Vocera SIP Telephony Gateway. Resulting in one-way authentication.
- Vocera performs SIP Options to SIP user agent (end-point) and not the SIP proxy server. When the UA wouldn't respond, or was incapable of responding, Vocera would mark the SIP Trunk out-of-service. SIP Options can be disabled. Vocera does have a fix available.
- Vocera is using RFC 5373 for Answer-Mode. When the supported feature is sent in the invite with answer-mode type Manual, Avaya 96x0 and 96x1 IP Phones configured as SIP, would auto-answer. The issue has been identified with the Avaya endpoints and a enhancement request has been submitted.

2.3. Support

Technical support on the Vocera Communications solution can be obtained by contacting Vocera Communications:

- URL – www.vocera.com/index.php/support
- Phone – (800) 473-3971

3. Reference Configuration

Figure 1 illustrates a sample configuration consisting of the following

- Avaya Aura® Communication Manager with Avaya G450 Media Gateway
- Avaya Aura® Session Manager (configured using Avaya Aura® System Manager)
- Avaya SIP and non-SIP phones
- Vocera Server
- Vocera SIP Telephony Gateway
- Vocera Badges

The enterprise also had connectivity to a simulated PSTN via Communication Manager.

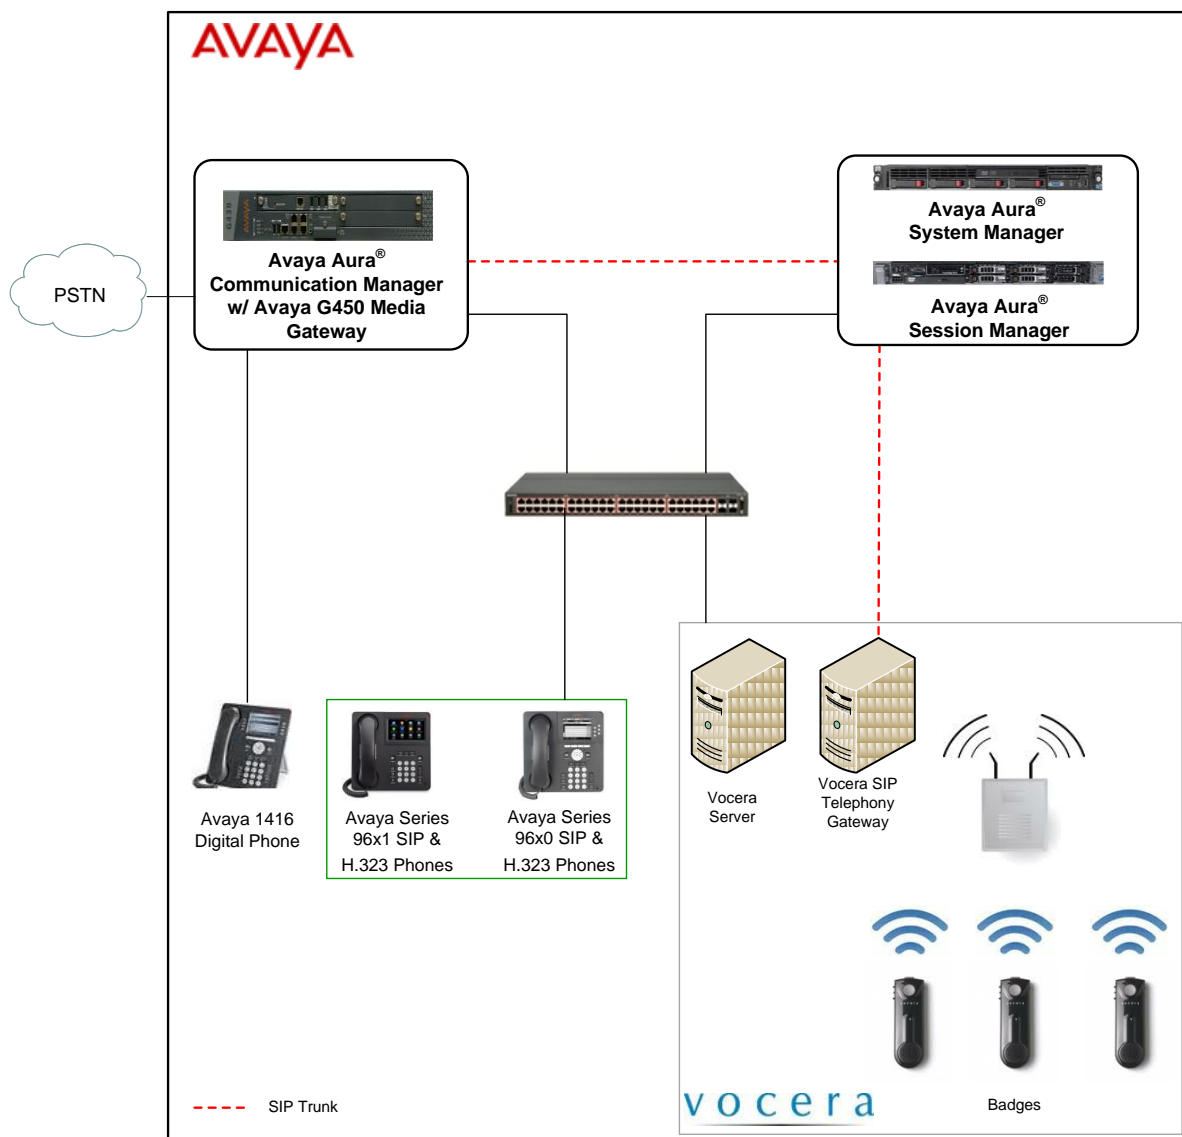

Figure 1: Vocera Communications Test Configuration

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Equipment/Software	Release/Version
Avaya Aura® Communication Manager with Messaging running on Avaya S8300 Server with an Avaya G450 Media Gateway	6.0.1 SP7 (R016x.00.1.510.1-19528)
Avaya Aura® Session Manager running on HP ProLiant DL360 G7 Server	6.1 SP7 (6.1.7.0.617012)
Avaya Aura® System Manager running on HP ProLiant DL360 G7 Server	6.1 SP8 (Build No. - 6.1.0.0.7345-6.1.5.803 Software Update Revision No: (6.1.12.1.1906)
Avaya 96x0 Series IP Telephones (SIP) <ul style="list-style-type: none"> • 9650 Avaya 96x0 Series IP Telephones (H.323) <ul style="list-style-type: none"> • 9630 	2.6 SP7 3.1 SP4
Avaya 96x0 Series IP Telephones (SIP) <ul style="list-style-type: none"> • 9650 Avaya 96x0 Series IP Telephones (H.323) <ul style="list-style-type: none"> • 9630 	2.6 SP7 3.1 SP4

5. Configure Avaya Aura® Communication Manager

This section provides the procedures for configuring Communication Manager. The procedures include the following areas:

- Verify Communication Manager License
- IP Codec Set
- IP Network Region
- IP Node Names
- SIP Signaling Group
- SIP Trunk Group
- Route Pattern
- Private Numbering
- AAR Analysis
- ARS Analysis

5.1. Verify Avaya Aura® Communication Manager License

Use the **display system-parameters customer-options** command and on **Page 2**, verify that the **Maximum Administered SIP Trunks** value is sufficient to support the desired number of simultaneous SIP calls across all SIP trunks at the enterprise including any trunks to the service provider. The example shows that **4000** licenses are available and **30** are in use. The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity.

display system-parameters customer-options		Page 2 of 11
OPTIONAL FEATURES		
IP PORT CAPACITIES	USED	
Maximum Administered H.323 Trunks:	4000	36
Maximum Concurrently Registered IP Stations:	2400	2
Maximum Administered Remote Office Trunks:	4000	0
Maximum Concurrently Registered Remote Office Stations:	2400	0
Maximum Concurrently Registered IP eCons:	68	0
Max Concur Registered Unauthenticated H.323 Stations:	100	0
Maximum Video Capable Stations:	2400	0
Maximum Video Capable IP Softphones:	2400	0
Maximum Administered SIP Trunks:	4000	30
Maximum Administered Ad-hoc Video Conferencing Ports:	4000	0
Maximum Number of DS1 Boards with Echo Cancellation:	80	0
Maximum TN2501 VAL Boards:	10	0
Maximum Media Gateway VAL Sources:	50	0
Maximum TN2602 Boards with 80 VoIP Channels:	128	0
Maximum TN2602 Boards with 320 VoIP Channels:	128	0
Maximum Number of Expanded Meet-me Conference Ports:	300	0
(NOTE: You must logoff & login to effect the permission changes.)		

5.2. IP Codec Set

This section describes the steps for administering an IP codec set in Communication Manager. This IP codec set is used in the IP network region for communications between Communication Manager and Session Manager. Use the **change ip-codec-set <c> command**, where **c** is a number between **1** and **7**, inclusive. IP codec sets are used in **Section 5.3** for configuring IP network regions to specify which codec sets may be used within and between network regions.

change ip-codec-set 1

5.3. IP Network Region

This section describes the steps for administering an IP network region in Communication Manager for communication between Communication Manager and Session Manager. Use the **change ip-network-region <n>** command, where **n** is a number between **1** and **250** inclusive, and configure the following:

- **Authoritative Domain** - Enter the appropriate name for the Authoritative Domain.
- During the compliance test, the authoritative domain is set to **avaya.com**.
- **Intra-region** and **Inter-region IP-IP Direct Audio** (media shuffling) – By default are set to **yes** if supported. This allows audio traffic to be sent directly between IP endpoints to reduce the use of media resources.
- **Codec Set** – Enter the IP codec set number as provisioned in **Section 5.2**.

change ip-network-region 1		Page 1 of 20

Idle Traffic Interval (sec): 20		
Keep-Alive Interval (sec): 5		
Keep-Alive Count: 5		

5.4. IP Node Names

This section describes the steps for setting the IP node name for Session Manager in Communication Manager. Use the **change node-names ip** command, and add a node name for Session Manager signaling. The node name for Session Manager is **sm_60_19** with IP Address **10.64.60.19**. Note: The **procr** / **10.64.60.13** entries, which are the node name / IP address for the processor board. It will be used later to configure the SIP Trunk in Session Manager.

change node-names ip		Page 1 of 2
IP NODE NAMES		
Name	IP Address	
default	0.0.0.0	
msgserver	10.64.60.13	
procr	10.64.60.13	
procr6	::	
sm_60_19	10.64.60.19	

5.5. SIP Signaling Group

This section describes the steps for administering a SIP signaling group for a new trunk that will be created for the connection between Communication Manager and Session Manager. Use the **add signaling-group <s>** command, where **s** is an available signaling group number. Enter the following values for the specified fields and the default values may be used for the remaining fields.

- **Group Type:** sip
- **IMS Enabled:** n
- **Transport Method:** tls
- **Peer Detection Enabled:** y
- **Peer Server:** SM (this field will be automatically populated)
- **Near-end Node Name:** Processor node name from **Section 5.4**
- **Near-end Listen Port:** 5061
- **Far-end Node Name:** Session Manager node name from **Section 5.4**
- **Far-end Listen Port:** 5061
- **Far-end Network Region:** The IP network region number from **Section 5.4**
- **DTMF over IP:** rtp-payload
- **Direct IP-IP Audio Connections:** y

```
add signaling-group 1                                     Page 1 of 1
                                     SIGNALING GROUP

    Enable Layer 3 Test? y               Initial IP-IP Direct Media? n
H.323 Station Outgoing Direct Media? n  Alternate Route Timer(sec): 6
```

5.6. SIP Trunk Group

This section describes the steps for administering a trunk group in Communication Manager for communication between Communication Manager and Session Manager. Use the **add trunk-group <t>** command, where **t** is an available trunk group number.

- **Group Type:** **sip**
- **Group Name:** Enter a descriptive name (e.g., **sm_60_19**)
- **TAC:** Set to any available trunk access code that is valid in the provisioned dial plan. (e.g., ***001**)
- **Service Type:** **tie**
- **Signaling Group:** **1** (Signaling group added in **Section 5.5**)
- **Number of Members:** **10** (Enter a desired value for trunk group members)
- **Numbering Format:** **private**

Note: The number of members determines how many simultaneous calls can be processed by the trunk through Session Manager.

```
add trunk-group 1                                     Page 1 of 21
                                     TRUNK GROUP

    Modify Tandem Calling Number: no

Show ANSWERED BY on Display? y
```

5.7. Route Pattern

Create a route pattern to use for the newly created SIP trunk group. Use the **change route-pattern <r>** command, where **r** is an available route pattern.

- **Pattern Name:** A descriptive name (e.g., **sm_60_19**)
- **Grp No:** The trunk group number from **Section 5.6** (e.g., **1**)
- **Set the FRL:** Enter a level that allows access to this trunk, with **0** being least restrictive

change route-pattern 1													Page 1 of 3				
Pattern Number: 1 Pattern Name: sm_60_19																	
SCCAN? n Secure SIP? n																	
Grp	FRL	NPA	Pfx	Hop	Toll	No.	Inserted						DCS/	IXC			
No			Mrk	Lmt	List	Del	Digits						QSIG				
							Dgts						Intw				
1:	1	0										n	user				
2:											n	user					
3:											n	user					
4:											n	user					
5:											n	user					
6:											n	user					
		BCC		VALUE		TSC	CA-TSC		ITC		BCIE	Service/Feature		PARM	No.	Numbering	LAR
		0	1	2	M	4	W	Request						Dgts		Format	
													Subaddress				
1:	y	y	y	y	y	n	n	rest				lev0-pvt		none			
2:	y	y	y	y	y	n	n	rest						none			
3:	y	y	y	y	y	n	n	rest						none			
4:	y	y	y	y	y	n	n	rest						none			
5:	y	y	y	y	y	n	n	rest						none			
6:	y	y	y	y	y	n	n	rest						none			

5.8. Private Numbering

Use the **change private-numbering 0** command, to define the calling party number to send to Session Manager. Add an entry for the trunk group defined in **Section 5.6**. In the example shown below, all calls originating from a 5-digit extension beginning with 4 or a 5 will be routed over any trunk group, since the Trk Grp(s) field is blank, will result in a 5-digit calling number. The calling party number will be in the SIP "From" header.

change private-numbering 0					Page 1 of 2	
NUMBERING - PRIVATE FORMAT						
Ext	Ext	Trk	Private	Total		
Len	Code	Grp(s)	Prefix	Len		
5	4			5	Total Administered: 2	
5	5			5	Maximum Entries: 540	

Note: There are two ways that an inbound call can reach an individual badge.

- A caller calls the Guest Access or Direct Access Number. In this case, the user is greeted by the 'Genie' voice interface, and prompted for a badge user to contact. (e.g., 28020)
- A user calls a Direct Inward Dialing (DID) number for a badge user. In this case, the call will be directly connected to the badge user without a greeting. (e.g., 303-252-8010)

During the compliance test, 5 digit and 10 digit dialing plans were utilized. Automatic Alternate Routing was utilized for 5 digits. Automatic Route Selection was utilized for 10 digits.

5.9. Automatic Alternate Routing Analysis

This section provides a sample Automatic Alternate Routing (AAR) routing used for routing calls with dialed digits 2xxxx to Session Manager. (See **Section 6.7** for corresponding Session Manager configuration). Note that other methods of routing may be used. Use the **change aar analysis 2** command and add an entry to specify how to route calls to 2xxxx. In the example shown below, calls with digits 2xxxx will be routed as an AAR call using route pattern 1 from **Section 5.7**. These calls will be routed to Session Manager and then to the Vocera SIP Telephony Gateway.

change aar analysis 2							Page	1	of	2
AAR DIGIT ANALYSIS TABLE										
Location: all							Percent Full: 2			
Dialed	Total		Route	Call	Node	ANI				
String	Min	Max	Pattern	Type	Num	Reqd				
2	5	5	1	aar		n				

5.10. Automatic Route Selection

This section provides a sample Automatic Route Selection (ARS) routing used for routing calls with dialed digits 30325xxxxx to Session Manager (See **Section 6.7** for corresponding Session Manager configuration). Note that other methods of routing maybe used. Use the **change ars analysis 3** command and add an entry to specify how to route calls to 30325xxxxx. In the example shown below, calls with digits 303252xxxx will be routed as an ARS call using route pattern 1 from **Section 5.7**. These calls will be routed to Session Manager and then to Vocera SIP Telephony Gateway.

- **Dialed String** field to **30325**
- **Total Min** field to **10**
- **Total Max** field to **10**
- **Route Pattern** field to **1**
- **Call Type** field to **fnpa**

change ars analysis 3							Page	1	of	2
ARS DIGIT ANALYSIS TABLE

String	Min	Max	Pattern	Type	Num	Reqd				
30325	10	10	1	fnpa		n				

6. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager as shown in the reference configuration. All provisioning for Session Manager is performed via the System Manager web interface. System Manager delivers a set of shared, secure management services and a common console across multiple products in the Avaya network, including the central administration of routing policies, and a common format for logs and alarms.

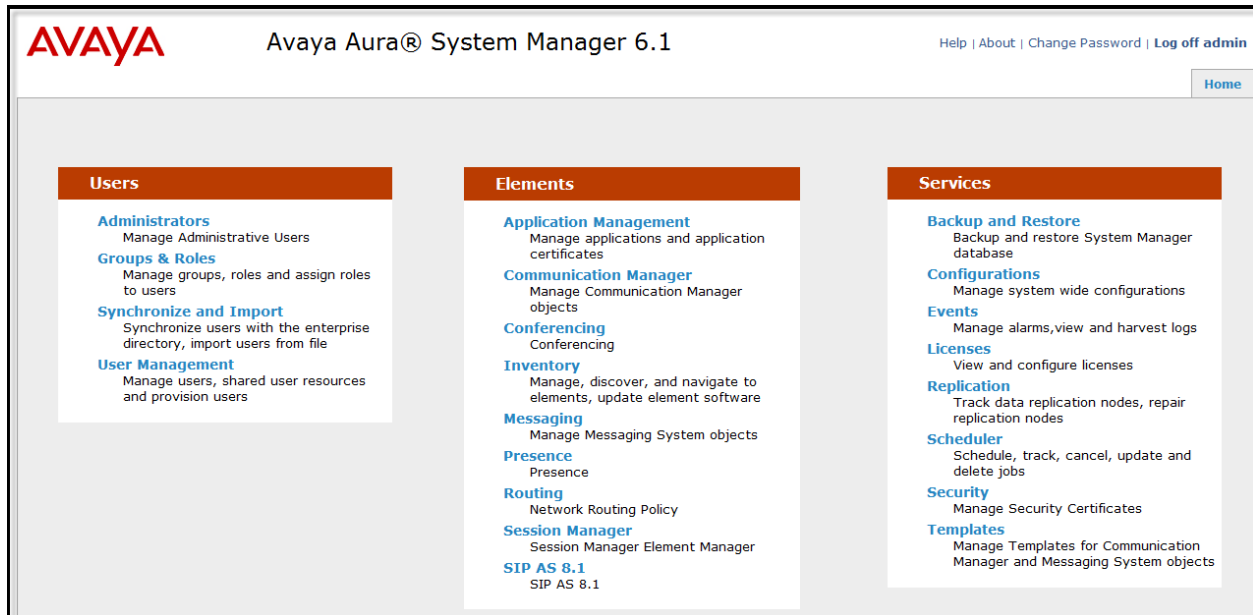

The following sections assume that Session Manager and System Manager have been installed and that network connectivity exists between the two platforms.

The procedures described in this section include configurations for the following:

- **SIP Domains** - SIP Domains are the domains for which Session Manager is authoritative in routing SIP calls. In other words, for calls to such domains, Session Manager applies Network Routing Policies to route those calls to SIP Entities. For calls to other domains, Session Manager routes those calls to another SIP proxy (either a pre-defined default SIP proxy or one discovered through DNS)
- **Locations** – Logical/physical areas that may be occupied by SIP Entities
- **SIP Entities** – Typically SIP Entities represent SIP network elements such as Session Manager instances, Communication Manager Systems, Session Border Controllers, SIP gateways, SIP trunks, and other SIP network devices
- **Entity Links** – Connection information which define the SIP trunk parameters used by Session Manager when routing calls to/from other SIP Entities, (e.g., ports, protocol (UDP/TCP/TLS), and trust relationship)
- **Time Ranges** – Specified windows during which SIP call processing is permitted for a particular Routing Policies
- **Routing Policies** - Policies that determine which control call routing between the SIP Entities based on applicable Dial Patterns
- **Dial Patterns** – Matching digit patterns which govern to which SIP Entity a call is routed
- **Manage Certificate** - In order for 3rd party equipment and Session Manager to use TLS to secure communications, a certificate must be installed on the Avaya equipment, and an Avaya certificate should be installed on the 3rd party equipment

Session Manager is managed via System Manager. Using a web browser, access <https://<ip-addr of System Manager>/SMGR>.

Log in using appropriate credentials. The main page for the administrative interface is shown below.

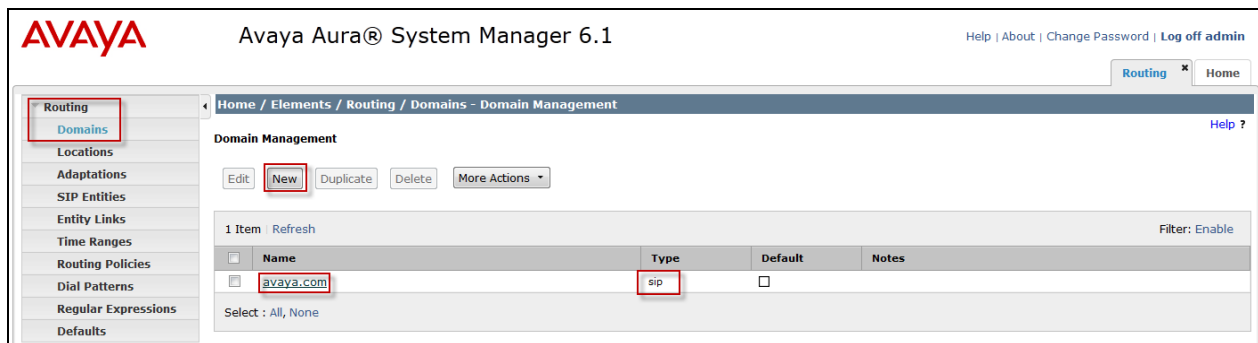

6.1. SIP Domains

In the reference configuration, one SIP domain was used; **avaya.com**.

Navigate to **Element** → **Routing** → **Domains** and click the **New** to add a new SIP domain with the following:

- Enter the SIP Domain (**avaya.com**) in the **Name** field
- **Type** : **sip**
- Enter a description in the **Notes** field if desired
- Click on the **Commit** button

6.2. Locations

Locations are used to identify logical and/or physical locations where SIP Entities reside, by specifying the IP addressing for the locations as well as for purposes of bandwidth management if required.

Navigate to **Routing** → **Locations** and click the **New** button (not shown) to add the Location. Enter the following information:

Section **General**.

- Enter a descriptive Location name in the **Name** field (e.g., **.60 & .101 subnets**)
- Enter a description in the **Notes** field if desired

Section **Location Pattern** heading, click on **Add**.

- Enter the IP address information for the Location (e.g., **10.64.60.* & 10.64.101***)
- Enter a description in the **Notes** field if desired
- Repeat steps in the Location Pattern section if the Location has multiple IP segments
- Modify the remaining values on the form, if necessary; otherwise, use all the default values
- Click on the **Commit** button

6.3. SIP Entities

A SIP Entity must be added for Session Manager and for each SIP-based telephony system supported by it using SIP trunks. In the sample configuration, a SIP Entity is added for Session Manager, Communication Manager and Vocera SIP Telephony Gateway (VSTG).

Note, the Session Manager SIP Entity is assumed to have already been configured. Navigate to **Routing**→**SIP Entities**; check the checkbox for the Session Manager SIP Entity and click the Edit button (not shown). Under the **Ports** section, verify the required Session Manager listening port for communication with VSTG is configured (e.g., **Port 5061** and **Protocol TLS**). If necessary, click the **Add** button to add the listening port and then click the **Commit** button when done to save the changes.

To add a SIP Entity, navigate to **Routing** → **SIP Entities** and click the **New** button (not shown). The configuration details for the SIP Entity defined for the Communication Manager are below:

Section **General**.

- **Name:** Enter an descriptive name
- **FQDN or IP Address:** Enter the IP address of the SIP Entity (e.g., **10.64.60.13**)
- **Type:** Select best match for the SIP entity (e.g., **CM**)
- **Location :** Select the appropriate location (Configured in **Section 6.2**) from the drop down menu (e.g., **.60 & .101 subnets**)

Section **SIP Link Monitoring**.

- Select desired option

6.4. Add Entity Link

A SIP trunk between Session Manager and a telephony system is described by an Entity link. Two Entity Links were created:

- Session Manager ↔ Communication Manger
- Session Manager ↔ VSTG

Navigate to **Routing** → **Entity Links**, and click the **New** button (not shown) to add a new Entity Link. The screen below shows the configuration details for the Entity Link connecting Session Manager with Communication Manager.

- **Name:** a descriptive name
- **SIP Entity 1:** select the Session Manager SIP Entity
- **Protocol:** select TLS as the transport protocol
- **Port: 5061.** This is the port number to which the other system sends SIP requests
- **SIP Entity 2:** select the Communication Manager SIP Entity
- **Port: 5061.** This is the port number on which the other system receives SIP requests
- **Connection Policy:** select **Trusted**
- **Notes:** optional descriptive text

Click **Commit** to save the configuration.

The Entity Link for connecting Session Manager with VSTG was similarly defined as shown in the screen below. Note the use of **TLS** and port **5061**. (See **Section 6.8** for corresponding TLS configuration).

6.5. Time Ranges

The **Time Ranges** form allows admission control criteria to be specified for **Routing Policies** (Section 6.6). In the reference configuration, no restrictions were used. To add a **Time Range**, navigate to **Elements** → **Routing** → **Time Ranges** and click the **New** button to add a new Time Range. Enter the following information:

- **Name:** Enter an descriptive name
- **Mo through Su:** check the box under each of these headings
- **Start Time:** enter **00:00**
- **End Time:** enter **23:59**
- **Notes:** Enter a description if desired

Click the **Commit** button. The following screen shows the Time Range page used during the compliance test.

Select : All, None

6.6. Routing Policies

Routing Policies associate destination SIP Entities (Section 6.3) with Time of Day admission control parameters (Section 6.5) and Dial Patterns (Section 6.7). In the reference configuration, Routing Policies are defined for:

- Inbound calls to Communication Manager
- Outbound calls to Vocera

To add a Routing Policy, navigate to **Routing** → **Routing Policies**, and click on the **New** button (not shown) on the right. Provide the following information:

Section General.

- **Name:** Enter an descriptive name
- **Notes:** Add a brief description (optional)

Section SIP Entity as Destination.

- Click **Select**, and then select the appropriate SIP Entity to which this routing policy applies

Section Time of Day.

- Click **Add**, and select the time range configured from Section 6.2.6.

Defaults can be used for the remaining fields. Click **Commit** to save each **Routing Policy** definition.

The following screens show the Routing Policy for Communication Manager.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar has a 'Routing' menu with 'Routing Policies' highlighted. The main content area is titled 'Routing Policy Details' and shows the configuration for a policy named 'cm_60_13'. The 'General' tab is active, showing the policy name, a 'Disabled' checkbox, and a 'Notes' field. Below this, the 'SIP Entity as Destination' section shows a table with one entry: 'cm_60_13' with FQDN or IP Address '10.64.60.13' and Type 'CM'. The 'Time of Day' section shows a table with one entry: '24/7' with Start Time '00:00' and End Time '23:59'. The 'Commit' button is highlighted in the top right corner.

Name	FQDN or IP Address	Type	Notes
cm_60_13	10.64.60.13	CM	

Ranking	Name	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Start Time	End Time	Notes
0	24/7								00:00	23:59	Time Range 24/7

The following screen shows the Routing Policy for routing calls to Vocera.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar has a 'Routing' menu with 'Routing Policies' highlighted. The main content area is titled 'Routing Policy Details' and shows the configuration for a policy named 'To_Vocera'. The 'General' tab is active, showing the policy name, a 'Disabled' checkbox, and a 'Notes' field. Below this, the 'SIP Entity as Destination' section shows a table with one entry: 'VSTG' with FQDN or IP Address '10.64.101.79' and Type 'Other'. The 'Time of Day' section shows a table with one entry: '24/7' with Start Time '00:00' and End Time '23:59'. The 'Commit' button is highlighted in the top right corner.

Name	FQDN or IP Address	Type	Notes
VSTG	10.64.101.79	Other	

Ranking	Name	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Start Time	End Time	Notes
0	24/7								00:00	23:59	Time Range 24/7

6.7. Dial Patterns

Session Manager uses dial patterns to route calls to the appropriate SIP Entity for processing. A dial pattern specifies which routing policy or routing policies are used to route a call based on the digits dialed by a user which match that pattern.

Navigate to **Routing** → **Dial Patterns**, and click the **New** button (not shown) to add a new Dial Pattern.

Section General.

- **Pattern:** dialed number or prefix
- **Min:** minimum length of dialed number
- **Max:** maximum length of dialed number
- **SIP Domain:** select the SIP Domain created in Section 6.1 (or select –ALL– to be less restrictive)
- **Notes:** optional descriptive text

Section Originating Locations and Routing Policies.

Click **Add** to select the appropriate originating Location and Routing Policy from the list (not shown). Default settings can be used for the remaining fields. Click Commit to save the configuration.

The following is an example of routing to route calls that match the pattern 4xxxx to Communication Manager.

Select: All, None

The following is an example of routing to route calls that match the pattern 2xxxx to Vocera.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar has a 'Routing' menu with 'Dial Patterns' highlighted. The main area is titled 'Dial Pattern Details' and 'General'. The 'Pattern' field is set to '280', 'Min' is '5', and 'Max' is '5'. The 'Emergency Call' checkbox is unchecked. The 'SIP Domain' dropdown is set to '-ALL-'. The 'Notes' field is empty. Below this, the 'Originating Locations and Routing Policies' section shows a table with one item.

Originating Location Name	Originating Location Notes	Routing Policy Name	Rank	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes
-ALL-	Any Locations	To_Vocera	0	<input type="checkbox"/>	VSTG	

The following is an example of routing to route calls that match the pattern 30325xxxxx to Vocera.

The screenshot shows the Avaya Aura System Manager 6.1 interface. The left sidebar has a 'Routing' menu with 'Dial Patterns' highlighted. The main area is titled 'Dial Pattern Details' and 'General'. The 'Pattern' field is set to '30325', 'Min' is '10', and 'Max' is '10'. The 'Emergency Call' checkbox is unchecked. The 'SIP Domain' dropdown is set to '-ALL-'. The 'Notes' field is empty. Below this, the 'Originating Locations and Routing Policies' section shows a table with one item.

Originating Location Name	Originating Location Notes	Routing Policy Name	Rank	Routing Policy Disabled	Routing Policy Destination	Routing Policy Notes
-ALL-	Any Locations	To_Vocera	0	<input type="checkbox"/>	VSTG	

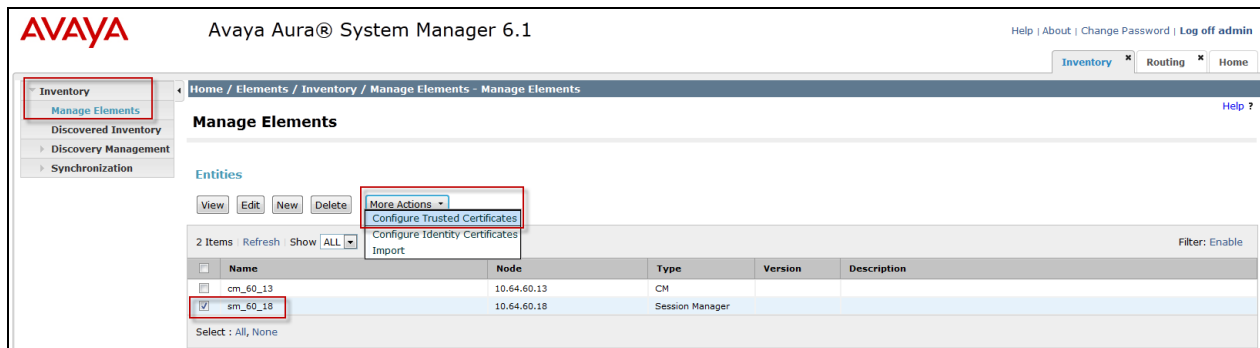

6.8. Manage Certificate

In order for Session Manager and the Vocera SIP Telephony Gateway (VSTG) to successfully negotiate a TLS connection, certificates are exchanged and authenticated during the TLS handshake. For two-way authentication both the Session Manager and VSTG would need to import each other's certificate. During this compliance test, only one-way authentication was performed with Session Manager importing VSTG's certificate. If it were two-way authentication steps for exporting Avaya's certificate and importing it into the VSTG would have been displayed below.

Trusted certificated file provided by VSTG imported to Session Manager. Navigate to **Home** → **Elements** → **Inventory** → **Managed Elements**.

Section **Entities**.

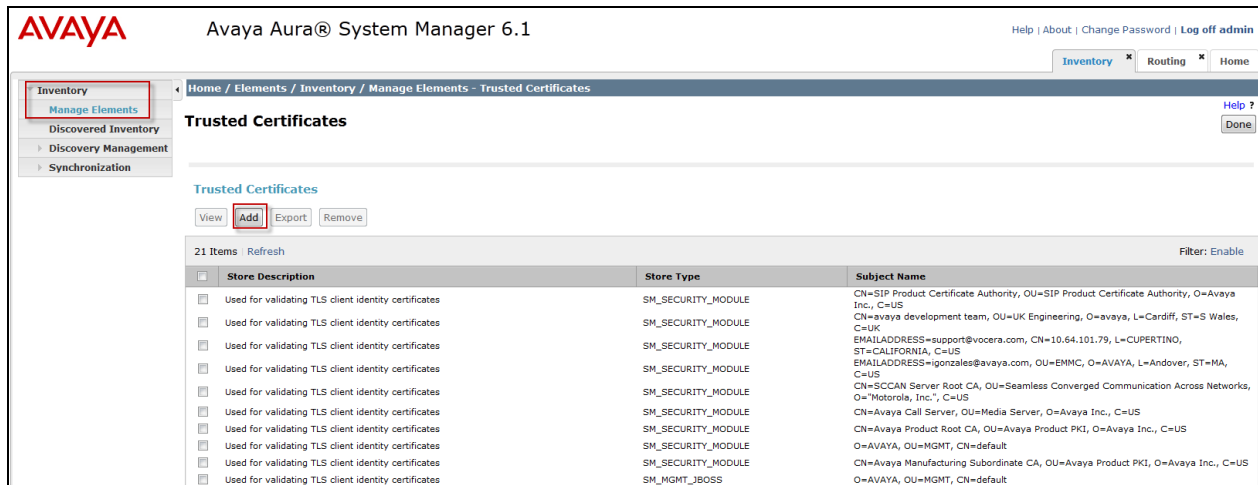

Select **Session Manager** (e.g., sm_60_18) → **More Actions** drop-down menu, select **Configure Trusted Certificate** button.

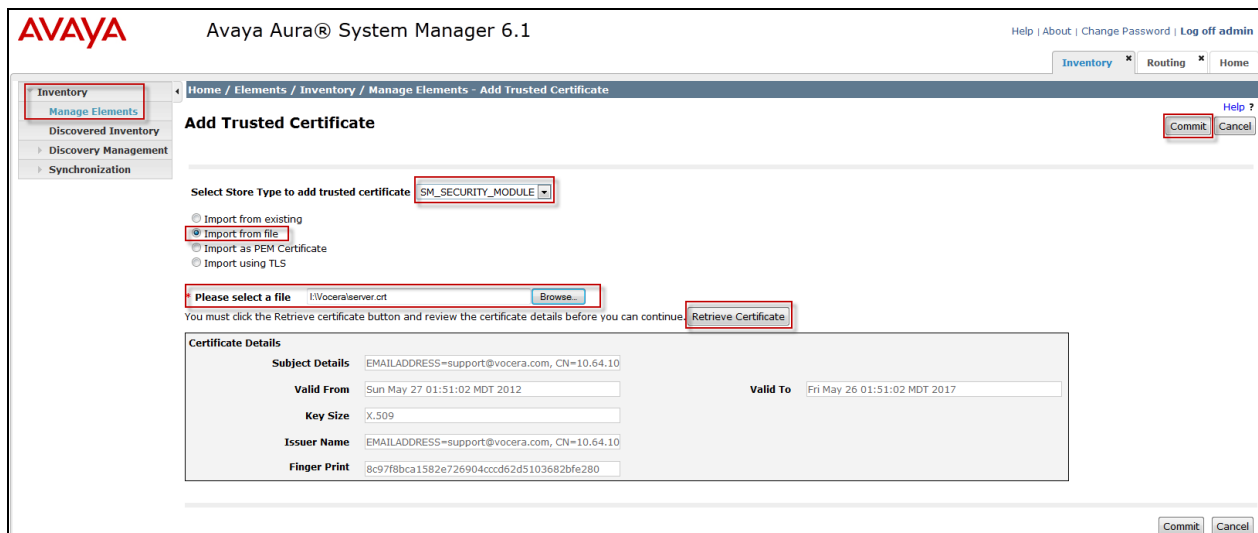

The screenshot displays the Avaya Aura System Manager 6.1 web interface. The left sidebar shows the 'Inventory' menu with 'Manage Elements' selected. The main content area is titled 'Manage Elements' and shows a table of entities. The table has columns for Name, Node, Type, Version, and Description. Two items are listed: 'cm_60_13' (Type: CM) and 'sm_60_18' (Type: Session Manager). The 'sm_60_18' row is selected, and the 'More Actions' dropdown menu is open, showing 'Configure Trusted Certificates' and 'Configure Identity Certificates'.

Name	Node	Type	Version	Description
cm_60_13	10.64.60.13	CM		
sm_60_18	10.64.60.18	Session Manager		

The **Trusted Certificate** screen will appear, as shown below. Click the **Add** button.

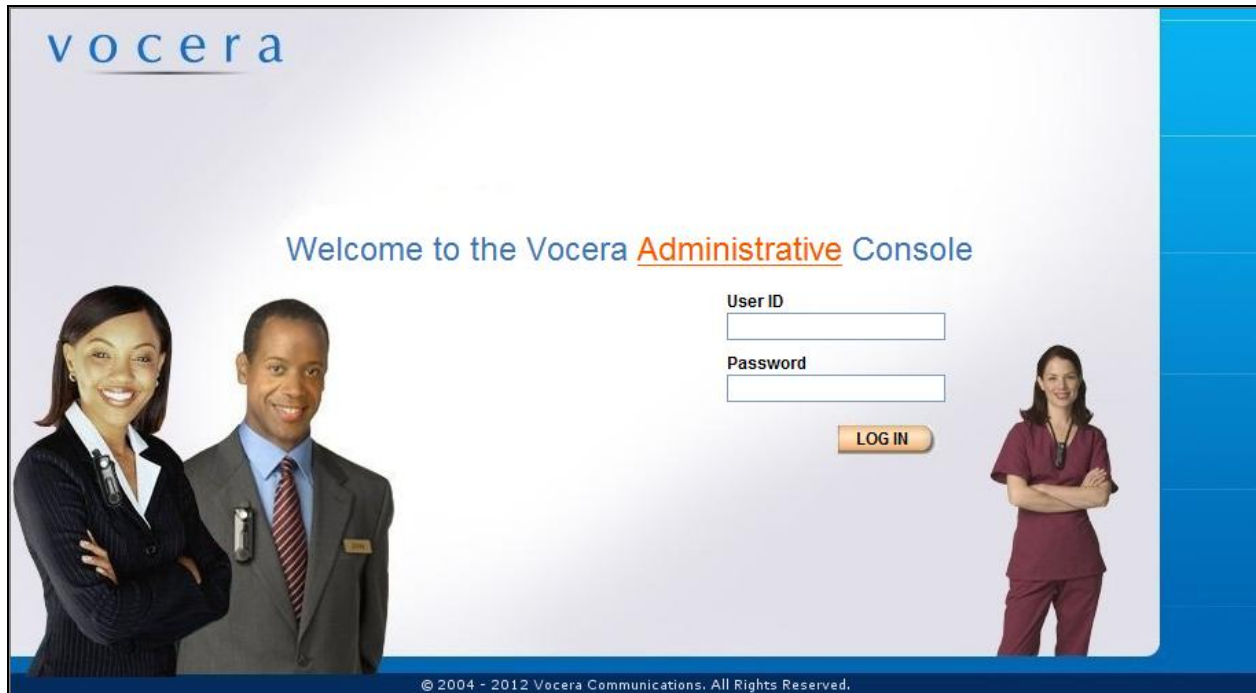

The **Add Trusted Certificate** screen will appear, as shown below. Select **SM_SECURITY_MODULE** from the **Select Store Type to add trusted certificate** drop-down menu, and select the **Import from file** radio button. Use the **Browse** button to locate the file provided by Vocera. Click the **Retrieve Certificate** button. Verify certificate information and then click the **Commit** button to store the certificate.

7. Configure Vocera Communications

This section will only describe the basic configuration to interface with Avaya Aura® Session Manager. For configuration steps for Vocera Communications System, refer to (3 -5) documentation.

The Vocera Communications System is configured using a web based console interface. Launch a web browser, enter <http://<IP address of Vocera Server>/console/AdminController> in the URL, and log in with the appropriate credentials.

7.1. Configure Telephony

This section shows the basic configuration needed to place calls to and from the badges. Once at the Administrator page, navigate to **Telephony** → **Basic Info** tab and provide the following information:

- Check the Enable Telephony Integration check box
- Enter the Guest access and Direct Access numbers. During the preparation phase of the compliance test, the following extensions were provided:
 - Guest Access Number – x28000
 - Direct Access Number – x28001
 - Number of Lines – 6
 - Three user extensions: x28010, x28011, x28012
- Set the Integration Type to **IP**
- Using the drop-down menu, select **SIP Version 2.0** for Signaling Protocol field under the IP Settings section
- Enter the Session Manager IP address for the Call Signaling Address field under the SIP Settings section. During the compliance test, IP address, **10.64.60.19**, was utilized
- Enter the Call Party extension Number. During the compliance test, Calling Party Number, **408-555-1212**, was utilized
- Click on the **Save Changes** button

The screenshot displays the Vocera Administrator interface for configuring telephony. The 'Basic Info' tab is selected under the 'Telephony' section. The configuration includes:

- Enable Telephony Integration:** Checked.
- Vocera Hunt Group Numbers:**
 - Guest Access: 28000
 - Direct Access: 28001
- Number of Lines:** 6
- Integration Type:** IP (selected over Analog and Digital).
- IP Settings:**
 - Signaling Protocol: SIP Version 2.0
- SIP Settings:**
 - Call Signaling Address: 10.64.60.19
 - Calling Party Number: 408-555-1212
- Buttons:** Save Changes, Reset, Enable Call Trace.

The footer indicates 'Vocera Server 4.3SP1 [Build 2348] Console [Build 2348]'.

Select **DID Info** tab to configure Direct Inward Dialing numbers for the badges. Select the **Add** button and enter in the DID range, and then click **Save Changes**.

The screenshot shows the Vocera Administrator web interface. The top navigation bar includes the Vocera logo, the user role 'ADMINISTRATOR', and a 'Log Out' button. The main section is titled 'Telephony' and contains several tabs: 'Basic Info', 'Access Codes', 'Toll Info', 'DID Info' (which is highlighted with a red box), 'PIN', 'Dynamic Extensions', 'Sharing', and 'Cisco'. On the left, a sidebar menu lists various system components, with 'Telephony' also highlighted by a red box. The 'DID Info' page features a 'Select Site' dropdown menu set to 'Global'. Below this, a descriptive paragraph explains the purpose of Direct Inward Dialing. A table with two columns, 'Prefix' and 'Range of Numbers', is shown with a red box around its header and one data row containing '303-25' and '2-8010 To 2-8019'. To the right of the table are three buttons: 'Add' (highlighted with a red box), 'Edit', and 'Delete'. At the bottom of the page, there are 'Save Changes' (highlighted with a red box) and 'Reset' buttons. The footer text reads 'Vocera Server 4.3SP1 [Build 2348] Console [Build 2348]'.

Edit
Delete

Save Changes Reset

Vocera Server 4.3SP1 [Build 2348] Console [Build 2348]

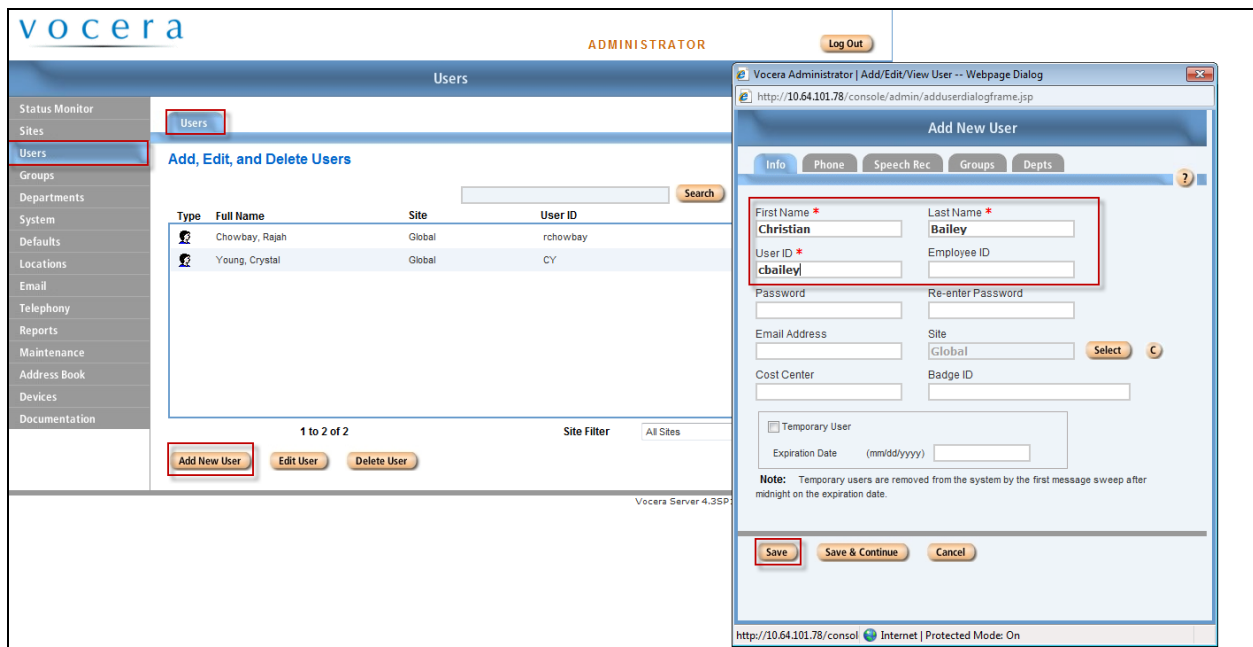

7.2. User Configuration

To configure a user navigate to **Users** → **User** tab. Click the **Add New User** button. Configure the following under **Info** tab:

- First Name
- Last Name
- User ID

Click the **Save** button.

Once the user is added, the user is able to login to any badge via voice command. Click the call button on the badge and the Genie will ask “Please say or spell your first and last name”. Speaking “Christian Bailey” will log the user in.

To configure the extension associated with the user, select the **Phone** tab and enter in extension number. (e.g., 2-8012) Then click the **Save** button.

The screenshot displays the Vocera Administrator web interface. On the left, a navigation menu includes 'Status Monitor', 'Sites', 'Users', 'Groups', 'Departments', 'System', 'Defaults', 'Locations', 'Email', 'Telephony', 'Reports', 'Maintenance', 'Address Book', 'Devices', and 'Documentation'. The 'Users' section is active, showing a table of users:

Type	Full Name	Site	User ID
	Bailey, Christian	Global	cbailey
	Chowbay, Rajah	Global	rchowbay
	Young, Crystal	Global	CY

Below the table are buttons for 'Add New User', 'Edit User', and 'Delete User'. The 'Edit User' button is highlighted with a red box. An 'Edit User' dialog box is open on the right, titled 'Edit User (Christian Bailey)'. It has tabs for 'Info', 'Phone', 'Speech Rec', 'Groups', and 'Depts'. The 'Phone' tab is selected and highlighted with a red box. Within this tab, the 'Desk Phone or Extension' field is highlighted with a red box and contains the text '2-8012'. Other fields include 'Cell Phone', 'Home Phone', 'Pager', 'Vocera Extension', 'Dynamic Extension', 'PIN for Long Distance Calls', 'Cisco EM Extension', and 'Cisco EM Auto-Answer'. There is a section for 'Vocera Access Anywhere' with a checkbox 'Enable Vocera Access Anywhere' and fields for 'Phone Password (minimum 5 chars.)' and 'Re-enter Phone Password'. A note states: 'Note: Phone password not required if caller ID permission is used.' At the bottom of the dialog are 'Save' and 'Cancel' buttons, with the 'Save' button highlighted by a red box. The browser address bar shows 'http://10.64.101.78/console/admin/adduserdialogframe.jsp'.

8. Verification Steps

This section provides the tests that can be performed to verify proper configuration of Communication Manager, Session Manager, and Vocera.

8.1. Verify Avaya Aura ® Communication Manager

On Communication Manager, verify the status of the SIP signaling group by using the **status signaling-group <s>** command, where **s** is the signaling group number administered in **Section 5.5**. Verify that the signaling group is **in-service** as indicated in the Group State field shown below.

```
status signaling-group 1
                        STATUS SIGNALING GROUP

      Group ID: 1
      Group Type: sip

      Group State: in-service
```

Verify the status of the local SIP trunk group by using the **status trunk <t>** command, where **t** is the trunk group number administered in **Section 5.6**. Verify that all trunks are in the **inservice/idle** state as shown below.

```
status trunk 1
                        TRUNK GROUP STATUS

Member   Port      Service State      Mtce Connected Ports
                        Busy

0001/001 T00001    in-service/idle    no
0001/002 T00002    in-service/idle    no
0001/003 T00003    in-service/idle    no
0001/004 T00004    in-service/idle    no
0001/005 T00005    in-service/idle    no
0001/006 T00006    in-service/idle    no
0001/007 T00007    in-service/idle    no
0001/008 T00008    in-service/idle    no
0001/009 T00009    in-service/idle    no
0001/010 T00010    in-service/idle    no
```

While calls are established, **Enter status trunk <t/r>** command, where **t** is the SIP trunk group configured in **Section 5.6**, and **r** is the trunk group member used for a call. Verify **Service State** is **in-service/active**.

```
status trunk 0001/001                                     Page 1 of 3

                                TRUNK STATUS

Trunk Group/Member: 0001/001                               Service State: in-service/active
Port: T00001                                                Maintenance Busy? no
Signaling Group ID: 1

IGAR Connection? no

Connected Ports: T00003
```

8.2. Verify Avaya Aura® Session Manager

Navigate to **Home** → **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring** and select the Communication Manager SIP Entity (not shown). Verify the **Conn. Status** and **Link Status** are **Up**.

The screenshot displays the Avaya Aura® System Manager 6.1 web interface. The left sidebar contains a navigation menu with 'Session Manager' and 'System Status' highlighted. The main content area shows the 'SIP Entity, Entity Link Connection Status' page. A table lists the connection status for a single SIP entity, 'cm_60_13'. The table has columns for Session Manager Name, SIP Entity Resolved IP, Port, Proto., Conn. Status, Reason Code, and Link Status. The 'Conn. Status' and 'Link Status' columns are highlighted with red boxes, showing 'Up' for both.

Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
sm_60_19	10.64.60.13	5061	TLS	Up	200 OK	Up

Repeat the procedure above selecting the VSTG SIP Entity, and verify the **Conn. Status** and **Link Status** are **Up**.

8.3. Verify Vocera Communications

Make the following calls and verify the calls are set up properly, there is two-way audio with good audio quality, and the calls are torn down properly after completing the calls.

- Place a call from a Vocera Badge to another Vocera Badge
- Place a call from a Vocera Badge to an enterprise Avaya phone
- Place a call from an enterprise Avaya phone to a Vocera Badge
- Place a call from a Vocera Badge to the PSTN

9. Conclusion

These Application Notes describe a sample configuration of how to configure Vocera Communications to interoperate with Avaya Aura® Session Manager and Avaya Aura® Communication Manager via a SIP trunk using TLS as the transport. All feature and serviceability test cases were completed and passed with the exceptions/observations noted in **Section 2.2**.
