

Avaya Solution & Interoperability Test Lab

Application Notes for Configuring Genesis Systems Corporation Contact Center Manager to Interoperate with Avaya Communication Server 1000 – Issue 1.0

Abstract

These Application Notes describe a compliance-tested configuration consisting of Genesis Systems Corporation Contact Center Manager solution and Avaya Communication Server 1000 7.6.

Genesis offers a unified management and reporting solution for Avaya Communication Server 1000. This compliance test focused on the interoperability of Genesis Contact Center Manager with Avaya Communication Server 1000 R7.6.

Readers should pay attention to **Section 2**, in particular the scope of testing as outlined in **Section 2.1** as well as the observations noted in **Section 2.2**, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe a compliance-tested configuration consisting of Genesis Systems Corporation Contact Center Manager (Contact Center Manager) solution and Avaya Communication Server 1000 R7.6 (Communication Server 1000).

Genesis offers a unified management and reporting solution for a variety of communication systems, including Avaya Communication Server 1000. This compliance test focused on the integration of Contact Center Manager with Communication Server 1000.

The Contact Center Manager solution uses a TeleType (TTY) interface to Communication Server 1000 in order to obtain the Automatic Call Distribution (ACD) reports 1, 2 and 4 that are generated by Communication Server 1000. Users access the Contact Center Manager server using a web browser in order to perform administrative tasks.

2. General Test Approach and Test Results

The compliance test focused on the ability for the Genesis Contact Center Manager application to accurately report Contact Center Statistics data from Communication Server 1000.

Two TTY ports are configured on Communication Server 1000. The server hosting the Contact Center Manager communicates with these two ports using serial connectivity. One TTY port is configured for historical data collection and the other for real time. The Contact Center Manager uses the Genesis GenStart module to collect the raw ACD report data generated by Communication Manager 1000. Users are then able to run the user friendly reports from the reporting option provided by the Contact Center Manager.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and /or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

2.1. Interoperability Compliance Testing

The compliance test validated the accuracy of the reports generated by the Contact Center Manager with respect to the raw ACD reports being generated by Communication Server 1000 in its day to day operation. Additionally, tests were performed to confirm the ability of Contact Center Manager to recover from network outages and server reboots.

2.2. Test Results

The objectives described in **Section 2.1** were verified.

2.3. Support

Information, Documentation and Technical support for Genesis products can be obtained at:

- Phone: 1 (888) 993-2288 or 1 (604) 530-9348
- Web: <http://www.buygenesis.com>
- Email: support@buygenesis.com

3. Reference Configuration

Figure 1 below illustrates the configuration used to compliance test the Contact Center Manager solution with Communication Server 1000.

The Genesis Server connects to the two TTY ports configured on Communication Server 1000 using serial interface. Two agents that belong to an ACD queue are configured on Communication Server 1000. During compliance testing since the server hosting the Contact Center Manager had no serial ports, a Serial to Ethernet converting device was used.

The following values were configured in Communication Server 1000 for the compliance testing.

ACD Directory Number (ACD DN)	54901
Agent IDs or Directory Numbers	54405, 54406
Agent Position IDs	1005, 1006

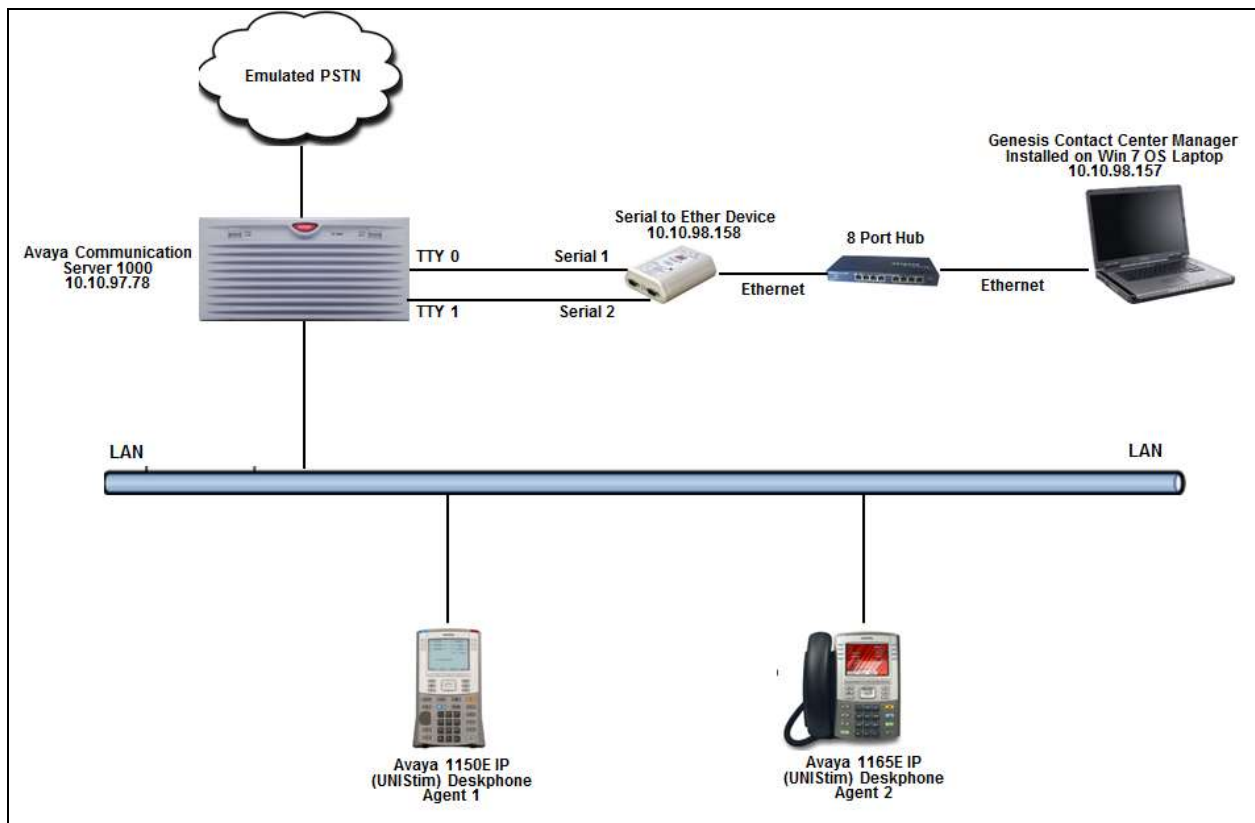

Figure 1 – Genesis Contact Center Manager Compliance Test Configuration

4. Equipment and Software Validated

The following equipment and version were used in the reference configuration described above:

Equipment/Software	Release/Version
Avaya Communication Server 1000	7.65 SP7
Avaya IP Phones: <ul style="list-style-type: none">• 1150(UNIStm)• 1165 (UNIStm)	C94 C94
Genesis: GenCCM installed on MS Windows 7 Professional SP1	16.5.24*
GenStart Module	4.16

*Note: Genesis does not manage releases with a single release number. The solution contains numerous components which are modified as required. The solution tested was the Generally Available release as of May, 2016 which included support for Avaya Communication Server 1000.

5. Configure Avaya Communication Server 1000

This document assumes that the Communication Server 1000 was properly installed and configured. For detailed information on how to install, configure and administer Communication Server 1000 refer to **Section 9**. Assumption is also made that an administrative user account is created on the Communication Server 1000 that provides access to all overlays. Access to overlays is required to configure TTY ports, ACD Directory Number and Agents that will be used during the compliance testing.

5.1. Configure TTY Port

Communication Server 1000 Command Line Interface (CLI) was used in configuring the TTY ports. Login to the Communication Server 1000 CLI (not shown) and access overlay (LD) **17** to add a TTY port. Two TTY ports, one for historical data collection (TTY0) and another for real time data (TTY1) were configured for compliance testing. The Contact Center Manager server connects to these two TTY ports using serial connectivity. Screen below shows an already configured TTY port that was used during compliance testing. The values shown in red are to be configured by the user and rest of the fields can be left at default values.

```

CUST 00
SSUP NO
APRT NO
```

5.2. Configure ACD Directory Number

Access overlay (LD) **23** to add an ACD Directory Number (ACD DN). During compliance testing **54901** was configured as an ACD DN. This is the queue number that callers will be calling to access the agents during compliance testing. Screen below shows an already configured ACD DN that was used during compliance testing. The values shown in red are to be configured by the user and rest of the fields can be left at default values. Note that for **STIO** field the value needs to be the TTY port configured for real time data collection. During compliance testing this TTY port was configured as **1** as shown in **Section 5.1**.

5.3. Configure Agent

Access overlay (LD) **11** or **20** to add an Agent. During compliance testing **54405** and **54406** were configured as agents. These agents belong to the ACD queue **54901**. Screen below shows an already configured agent **54405** that was used during compliance testing. The values shown in red are to be configured by the user and rest of the fields can be left at default values.

5.4. Configure Schedule Data Block for ACD Management Reports

Access overlay (LD) 23 to add a Schedule Data block (SCB). During compliance testing reports 1, 2 and 4 were being generated. Screen below shows an already configured SCB that was used during compliance testing. The values shown in red are to be configured by the user and rest of the fields can be left at default values. Note that for **PRIO** field the value needs to be the TTY port configured for historical data collection. During compliance testing this TTY port was configured as **0** as shown in **Section 5.1**.

6. Configure Genesis Contact Center Manager

Genesis engineer or an approved installer will install and initially configure all server components including Site information. Details of the steps are beyond the scope of this document. Refer to **Section 9** for detail configuration of Genesis Server.

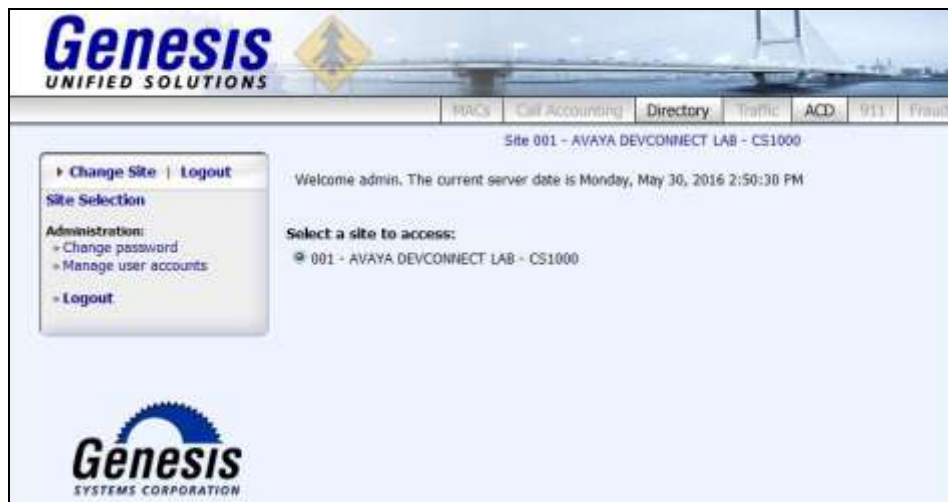

6.1. Genesis Contact Center Manager Configuration Details

The Contact Center Manager application is accessed via web browser. Enter <http://<hostname>/GenWeb/> where <hostname> is the IP address or qualified domain name of the Genesis server.

Login to the system using the credentials supplied by the installer as shown in the screen below.

If the system is configured for more than one site, select the site to interact with and choose the tab for the **ACD** application as shown in the screen below. During compliance testing only one site was configured on Genesis system.

The initial **ACD** screen provides a list of recent Contact Center data download attempts (successful or not) from Communication Server 1000. Clicking on the objects in the diagram or the links in the navigation panel on the left side of the screen will navigate to the respective task screens.

To configure the connection settings to Communication Server 1000, on the navigation panel, click **System Configuration** → **Update switch settings**. Select the radio button for **Telnet capture (TCP/IP)**. Enter the IP address of the serial to ethernet converting device box that was used during compliance testing and its configured TCP port in the **IP address / host** and **TCP port** fields respectively. Retain default values for all other fields.

Click **Save** to complete the task.

7. Verification Steps

Open the **GenStart** module in the Genesis Server and verify that the **GCOM** application status is **Running (online)** as shown in the screen below. The GenStart module can be accessed from the Windows System Tray on the Genesis server.

ACD calls were made to Communication Server 1000 agents to generate ACD data on the Communication Server 1000 which were then downloaded by the Contact Center Manager application. Screen below shows the successful collection of this data.

The screenshot displays the Genesis Unified Solutions web interface for Site 001 - AVAYA DEVCONNECT LAB - CS1000. The interface includes a navigation menu on the left and a main content area with a diagram and a log table.

Additionally, reports were run from the Contact Center Manager application as shown below. The Genesis Contact Center Manager solution provides various options to run the reports. The full details of reports are beyond the scope of these Application Notes. The example screens below shows a Manual report and Real-time statistics.

The screenshot shows the Genesis Unified Solutions interface. At the top, there is a navigation bar with tabs for MACs, Call Accounting, Directory, Traffic, ACD, 911, and Fraud. Below this, the site information is displayed as "Site 001 - AVAYA DEVCONNECT LAB - CS1000".

On the left side, there is a sidebar menu with the following sections:

8. Conclusion

These Application Notes describe the procedures required to configure Genesis Systems Corporation Contact Center Manager solution for collecting ACD reports that are generated by Avaya Communication Server 1000. The Contact Center Manager application successfully passed compliance testing.
