---

# **Application Notes for Configuring Rauland-Borg Responder<sup>®</sup> 5 to Interoperate with Avaya Communication Server 1000 R7.6 and Avaya Aura<sup>®</sup> Session Manager R6.3 – Issue 1.0**

## **Abstract**

These Application Notes describe a compliance-tested configuration consisting of the Rauland-Borg Responder<sup>®</sup> 5 solution, Avaya Communication Server 1000 and Avaya Aura<sup>®</sup> Session Manager.

The Rauland-Borg Responder<sup>®</sup> 5 solution is a complete nurse call system with associated Staff Management applications ensuring calls for assistance from patient rooms are immediately routed to the proper staff for response.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

# 1. Introduction

These Application Notes describe a compliance-tested configuration consisting of the Rauland-Borg Responder<sup>®</sup> 5 (hereafter known as Responder) solution, Avaya Communication Server 1000 (hereafter known as Communication Server 1000) and Avaya Aura<sup>®</sup> Session Manager (hereafter known as Session Manager).

The Responder solution is a complete nurse call system with associated Staff Management applications ensuring calls for assistance from patient rooms are immediately routed to the proper staff for response. It should be noted that the solution involves the use of a third party Brekeke SIP Server which is sold and supported by Rauland-Borg and/or Rauland-Borg authorized distributors, as a standard element of any solution involving SIP PBX integrations.

Calls from a patient room could be initiated by a patient (pain, assistance needed, etc.), or hospital staff (room cleaning, linens, etc.) with the push of a button. Staff using Avaya phones can be incorporated into the system so that calls to talk to a nurse for example would route through Session Manager to Communication Server 1000, and to be able to call the patient room in return. This adds the benefit of staff having access to other resources in the hospital using Avaya endpoints.

Hospital staff members who are responsible for direct communication with patient rooms generally roam using wireless phones. During compliance testing only Avaya Desk phones was used.

## 2. General Test Approach and Test Results

The compliance test focused on the ability for Rauland Responder<sup>®</sup> 5 endpoints to initiate and receive calls to and from Avaya Communication Server 1000 via Avaya Aura<sup>®</sup> Session Manager.

### 2.1. Interoperability Compliance Testing

The compliance test validated the ability of Responder to route calls to and from patient rooms to Avaya endpoints. Additionally, testing validated the ability for the Responder solution to recover from common outages such as network outages and server reboots.

Responder endpoints are designed with limited functionality. Responder endpoints are not designed for multi-line functions like Hold, Conference and Transfer. These functions were successfully carried out on Avaya Deskphones registered to Communication Server 1000 while connected to calls with Responder endpoints.

### 2.2. Test Results

The objectives described in **Section 2.1** were verified.

The following observations were made in the course of this testing.

- The Responder Branch Regional Controller media processing unit (BRC) sends audio (RTP) on a different port than it listens on (asymmetric). For example, if a session is established with the Session Description Protocol (SDP) indicating the Responder BRC will be listening on port 5004 for RTP packets, it will send the RTP to the Avaya Media Gateway from a different port (50957 for example).
- Since NAT or Firewall implementations expect RTP to be sent and received on the same port (5004 in the above example), packets sent from the BRC are not passed through to the other endpoint. This could impact not only the Avaya Media Resources, but also any intervening NAT or Firewall traversal devices between the two solutions.
- The workaround involves using the Brekeke SIP Server as a Media Relay.
  - Using this method, all calls connect through the Brekeke server rather than directly between the Responder BRC and the Avaya Media Gateways.
  - The impact of this workaround is that additional processing power is used to accommodate the media processing.
  - A Rauland engineer should be consulted to ensure adequate hardware resources are planned based on expected call traffic.

## 2.3. Support

Information, Documentation and Technical support for Rauland-Borg products can be obtained at:

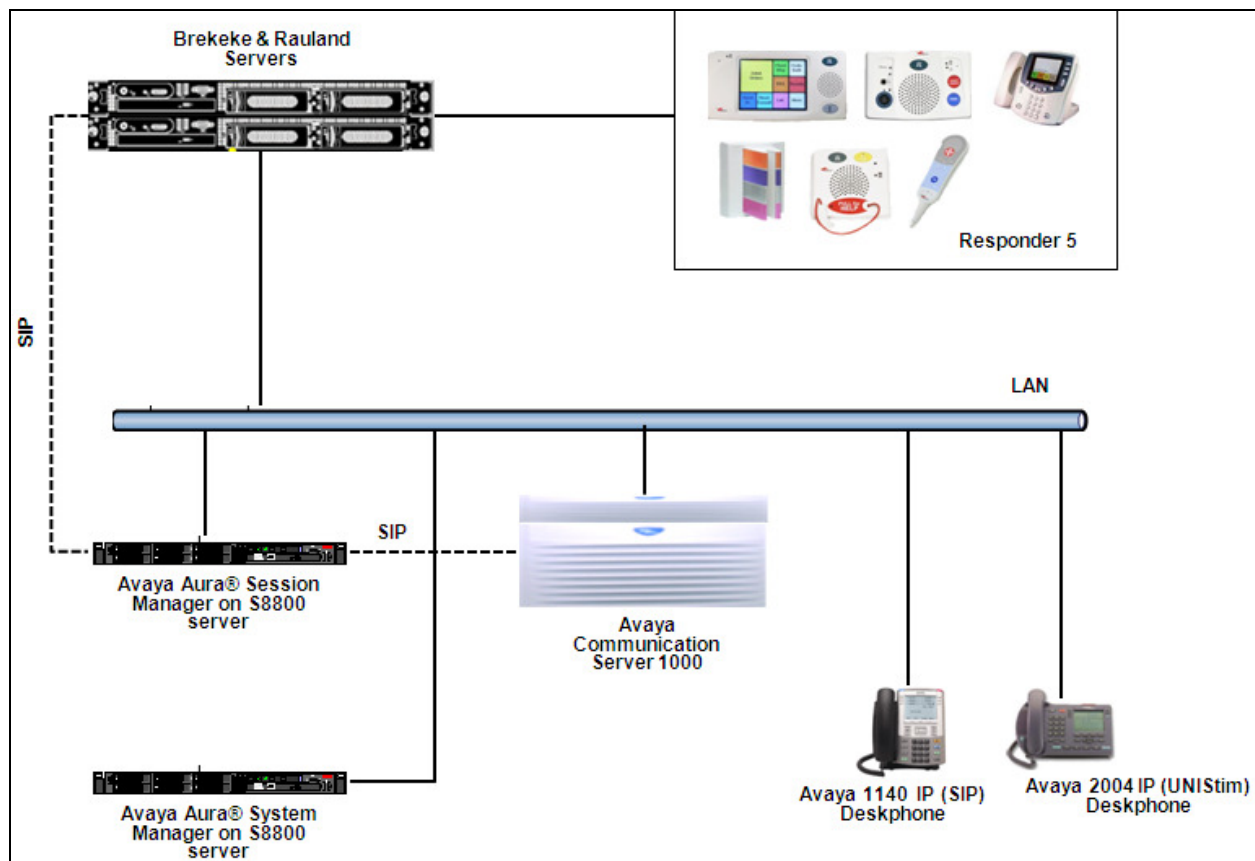

- Phone: 1-847-590-7130
- Web: <http://www.rauland.com/>

### 3. Reference Configuration

**Figure 1** illustrates the compliance test configuration consisting of:

- Avaya Communication Server 1000 R7.6
- Avaya Aura® Session Manager R6.3
- Avaya Aura® System Manager R6.3
- Various IP and SIP endpoints.
- Brekeke SIP Server
- Responder® 5 Branch Regional Controller
- Responder® 5 Communication Endpoints

Calls routed to and from the Communication Server 1000 used SIP trunks between the Brekeke SIP server and Session Manager, and in turn SIP trunks between Session Manager and Communication Server 1000.

**Figure 1 – Rauland-Borg Responder® 5 Compliance Test Configuration**

## 4. Equipment and Software Validated

The following equipment and version were used in the reference configuration described above:

Equipment	Version
Avaya Communication Server 1000	7.65
Avaya Aura® Session Manager	6.3
Avaya Aura® System Manager	6.3
Avaya IP Deskphones: 1140 (SIP) 2004P1 (UNISTim)	4.03.09 0602B76
Rauland Nurse Call	T12 SP2
Rauland Gateway Server	T12 SP2
Rauland Apps	T12 SP2
Rauland DB	T12 SP2
Brekeke Server (Registrar)	3.243

## 5. Configure Avaya Communication Server 1000

This section describes the Communication Server 1000 configuration necessary to interoperate with Session Manager and Responder. It provides the procedures for configuring Avaya Communication Server 1000 system. The procedures include the following areas:

- Logging into the Element Manager via System Manager.
- Configuring the SIP Signaling Gateway.
- Configuring a D-Channel.
- Configuring Route and Trunks.
- Configuring Digit Manipulation Block.
- Configuring Route List Block.
- Configuring Distant Steering Code.

For detail configuration details of the Communication Server 1000 refer to **Section 10**.

## 5.1. Logging into Element Manager via Avaya Aura® System Manager

To login to the System Manager open a browser and type in the IP address of the System Manager in the URL (not shown). Screen below shows the main dashboard. Navigate to **Elements → Communication Server 1000**.

## 5.2. Configuring the SIP Signaling Gateway

This section describes the configuration required on the SIP Signaling Gateway so that the Communication Server 1000 can communicate with the Session Manager via SIP Trunks.

To add a Node, from the EM left navigator screen, navigate to **System → IP Network → Nodes: Servers, Media Cards** as shown below.

Assumption is made here that the IP Telephony node is already added.

During compliance testing Node **511** was added. Click on this Node as shown in screen below to view the configured values.

Note: Changes made on this page will NOT be transmitted until the Node is also saved.

Scroll down to the **Proxy or Redirect Server** section. The following values were configured during compliance testing.

**Primary TLAN IP address:** *10.10.97.198*. This is the IP address of the Session Manager.

**Transport protocol:** Select *UDP* from the drop down menu.

Retain default values for other fields.

The screenshot shows the AVAYA CS1000 Element Manager interface. The left sidebar contains a navigation menu with categories like UCM Network Services, Home, Links, System, and Alarms. The main content area displays the configuration for Node ID: 511 - Virtual Trunk Gateway Configuration Details. The 'Proxy Or Redirect Server' section is highlighted, showing the following configuration:

- Primary TLAN IP address: 10.10.97.198 (Note: The IP address can have either IPv4 or IPv6 format based on the value of "TLAN address type")
- Port: 5060 (Range: 1 - 65535)
- Transport protocol: UDP (Selected from a dropdown menu)
- Options: ☐ Support registration, ☐ Primary CDS proxy

Save and transmit (not shown) these Node properties to complete the SIPGw configuration.

### 5.3. Configuring D-Channel

This section explains the configuration of a D-Channel for a SIP Trunk. From the EM navigation screen, navigate to **Routes and Trunks → D-Channels** as shown below.

The screenshot shows the navigation menu of the AVAYA CS1000 Element Manager. The 'Routes and Trunks' section is highlighted, and the 'D-Channels' option is selected. The menu structure is as follows:

- Customers
- Routes and Trunks (Highlighted)
  - Routes and Trunks
  - D-Channels (Selected)
  - Digital Trunk Interface
- Dialing and Numbering Plans
  - Electronic Switched Network
  - Flexible Code Restriction
  - Incoming Digit Translation

Choose an available D-Channel number to add as shown in the screen below. During compliance testing D-Channel number **1** was configured. Click on **Edit** to view its configuration.

**AVAYA CS1000 Element Manager**

Managing: **10.10.97.78** Username: admin  
Routes and Trunks > D-Channels

Click on the **Submit** button (not shown) to complete the D-channel configuration.

## 5.4. Configuring Route and Trunks

This section explains the configuration of the SIP route and trunks which will be used by Communication Server 1000 to communicate with the Session Manager. To add a new route, navigate to **Routes and Trunks** → **Routes and Trunks** from the EM left hand navigator window as shown in screen below.

From the **Routes and Trunks** screen as shown below click on **Add route** button to start configuring a new route.

During compliance testing route 1 was added. The next three screens below shows the configuration for route 1 used during compliance testing.

**Route data block (RDB) (TYPE):** *RDB*

**Customer number (CUST):** *00*

**Route number (ROUT):** *1*

**Designator field for trunk (DES):** A descriptive name.

**Trunk type (TKTP):** *TIE*

**Incoming and outgoing trunk (ICOG):** Select *Incoming and Outgoing (IAO)* from the drop down menu.

**Access code for the trunk route (ACOD):** An available Directory number from the system.

**The route is for a virtual trunk route (VTRK):** Enable the box.

**Zone for codec selection and bandwidth management (ZONE):** A number configured in the system.

**Node ID of signaling server of this route (NODE):** *511*; this is the same node added in **Section 5.2**.

**Protocol ID for the route (PCID):** Select *SIP (SIP)* from the drop down menu.

**Integrated services digital network option (ISDN):** Enable the box.

**D channel number (DCH):** *1*; this is the same D channel added in **Section 5.3**.

**Interface type for route (IFC):** Select *Meridian M1 (SL1)* from the drop down menu.

**Private network identifier (PNI):** A value configured in the system.

**Call type for outgoing direct dialed TIE route (CTYP):** Select *Coordinated Dialing Plan (CDP)* from the drop down menu.

**Calling number dialing plan (CNDP):** Select *Coordinated dialing plan (CDP)* from the drop down menu.

**Signaling arrangement (SIGO):** Select *Standard (STD)* from the drop down menu.

**Route class (RCLS):** Select *Route Class marked as external (EXT)* from the drop down menu. Retain default values for other fields.

Click on the **Submit** button (not shown) to complete the configuration.

## 5.5. Configuring Digit Manipulation Block

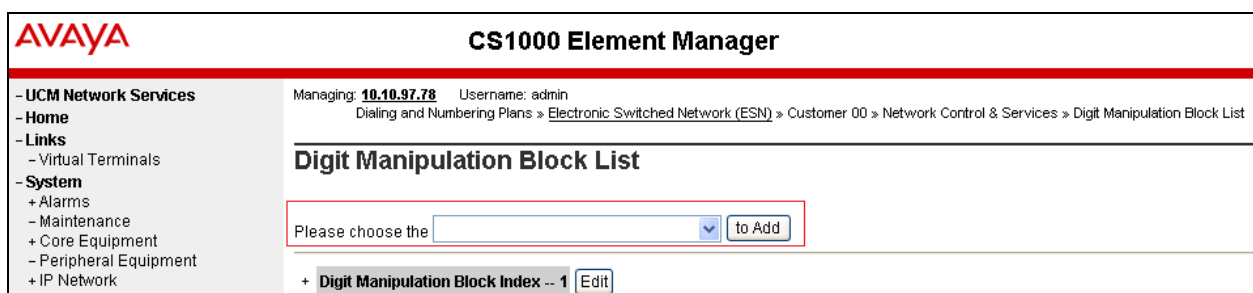

This section explains the digit manipulation block that is to be configured in the Communication Server 1000 dialing plan for its users to communicate with the Responder via the Session Manager. From the EM navigator pane, navigate to **Dialing and Numbering Plans** → **Electronic Switched Network** as shown below.

Click on **Digit Manipulation Block (DGT)** option as shown below.

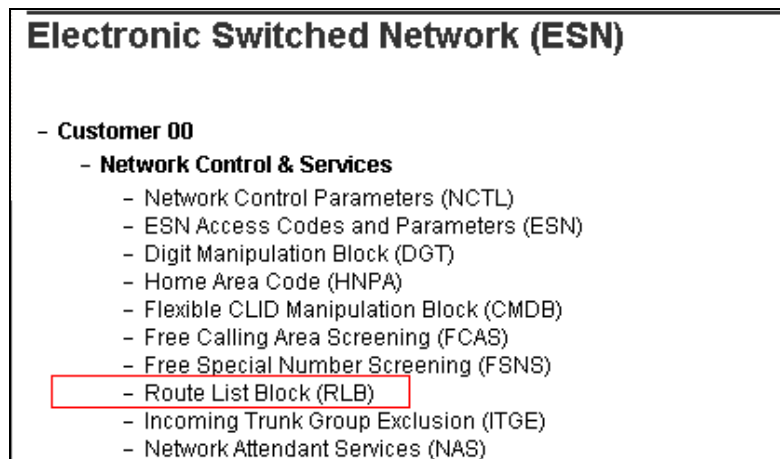

Screen below shows the **Digit Manipulation Block List** page where users can add a digit manipulation block index by selecting an available one from the drop down menu. During compliance testing **Digit Manipulation Block Index -- 0** was used which is already added in the Communication Server 1000 system by default.

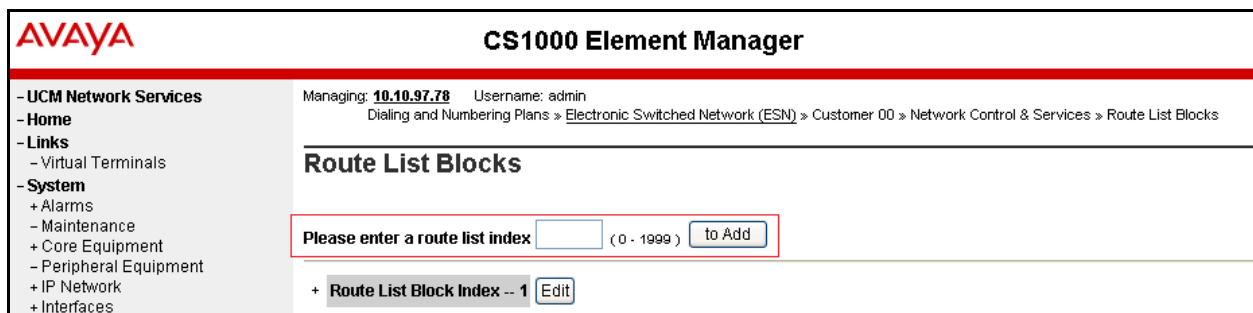

## 5.6. Configuring Route List Block

This section explains the route list block that is to be configured in the Communication Server 1000 dialing plan for its users to communicate with the Responder via Session Manager. From the EM navigator pane, navigate to **Dialing and Numbering Plans → Electronic Switched Network** as shown in Section 5.5. Click on **Route List Block (RLB)** option as shown below.

To add a route list index, enter a valid number in the **Please enter a route list index** box and click on **to Add** button as shown in the screen below. During compliance testing a route list block index of 1 was added.

Screen below show the values configured for the route list index block 1 added during compliance testing.

**Digit Manipulation Index:** Select *0* from the drop down menu. This was configured in **Section 5.5**.

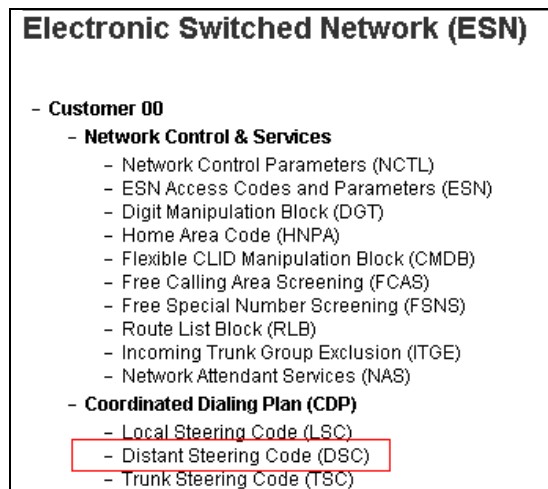

**Route Number:** Select *1* from the drop down menu. This was configured in **Section 5.4**. Retain default values for other fields.

Click on **Submit** to complete the configuration.

The screenshot displays the AVAYA CS1000 Element Manager interface. On the left is a navigation tree with categories like UCM Network Services, Links, System, Alarms, Maintenance, Core Equipment, Peripheral Equipment, IP Network, Interfaces, Engineered Values, Emergency Services, Geographic Redundancy, Software, Customers, Routes and Trunks, Routes and Trunks, D-Channels, Digital Trunk Interface, Dialing and Numbering Plans, Electronic Switched Networks, Flexible Code Restriction, Incoming Digit Translation, Phones, Templates, Reports, Views, Lists, Properties, Migration, Tools, Backup and Restore, Date and Time, Logs and reports, Security, Passwords, Policies, and Login Options. The main area is titled 'Indexes' and contains several configuration fields. The 'Digit Manipulation Index' is set to 0 and is highlighted with a red box. The 'Route Number' is set to 1 and is also highlighted with a red box. Other fields include Time of Day Schedule (0), Facility Restriction Level (0), ISL D-Channel Down Digit Manipulation Index (0), Free Calling Area Screening Index (0), Free Special Number Screening Index (0), Business Network Extension Route (unchecked), Incoming CLID Table (0), Local Termination entry (unchecked), Skip Conventional Signaling (unchecked), Use Tone Detector (unchecked), Conversion to LDN (unchecked), Expensive Route (unchecked), Strategy on Congestion (No Reroute (NRR)), QSIG Alternate Routing Causes (QSIG Alternate Routing Cause 1), Preferred Routing (Preferred Route 1), ISDN Drop Back Busy (Drop Back Disabled (DBD)), ISDN Off-Hook Queuing Option (unchecked), Off-Hook Queuing Allowed (unchecked), Call Back Queuing Allowed (unchecked), and VNS Options (Entry is a VNS Route: unchecked). At the bottom right are buttons for Submit, Refresh, Delete, and Cancel.

## 5.7. Configuring Distant Steering Code

This section explains the distant steering code that is to be configured in the Communication Server 1000 dialing plan for its users to communicate with the Responder via Session Manager. From the EM navigator pane, navigate to **Dialing and Numbering Plans → Electronic Switched Network** as shown in Section 5.5. Click on **Distant Steering Code (DSC)** option as shown below.

To add a distant steering code, select **Add** from the drop down menu and enter an available distant steering code in the **Please enter a distant steering code** box and click on **to Add** button to finish adding one as shown in the screen below. During compliance testing a code of **760** was added since the pilot number assigned to Responder was 76000.

Screen below show the values configured for the distant steering code of 760 added during compliance testing.

Enter the values as shown in screen below.

**Flexible Length number of digits:** 5; since 76000 the number to dial Responder is a 5 digit number.

**Route List to be accessed for trunk steering code:** Select *1* from the drop down menu. This was configured in **Section 5.6**.

Retain default values for other fields.

Click on **Submit** to complete the configuration.

The screenshot shows the Avaya CS1000 Element Manager web interface. The left sidebar contains navigation links for UCM Network Services, Links, System, Customers, Routes and Trunks, and Dialing and Numbering Plans. The main content area is titled 'Distant Steering Code' and contains the following configuration fields:

- Distant Steering Code: 76
- Flexible Length number of digits: 5 (0 - 10)
- Display: Local Steering Code (LSC)
- Remote Radio Paging Access: ☐
- Route List to be accessed for trunk steering code: 1
- Collect Call Blocking: ☐
- Maximum 7 digit NPA code allowed:
- Maximum 7 digit hXX code allowed:

At the bottom right, there are buttons for Submit, Refresh, Delete, and Cancel. The Submit button is highlighted with a red border.

## 6. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring routing using Avaya Aura® System Manager. The procedures include the following areas:

For detail configuration details of the Session Manager refer to **Section 10**

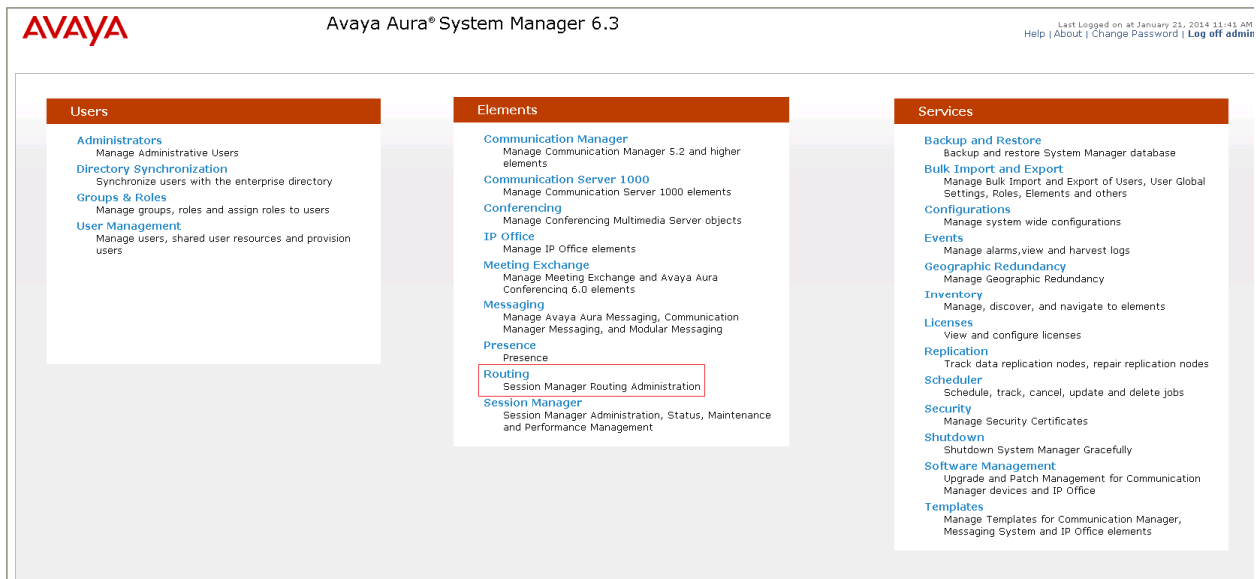

Session Manager is administered via the Avaya Aura® System Manager Web interface. In a browser, navigate to **https://<hostname>/** and login with appropriate credentials. Use the hostname or IP Address of the System Manager server in the URL.

The screenshot shows the Avaya Aura® System Manager 6.3 login page. The page includes a 'Log On' section with the following fields and buttons:

- User ID:
- Password:
- Log On button
- Clear button

Below the login fields, there is a 'Supported Browsers' section that lists the following browsers: Internet Explorer 8.x, 9.x or 10.x or Firefox 15.0, 16.0 or 17.0.

All navigation is performed by clicking links in the navigation links on the System Manager landing page as shown in the screen below. Click on the **Routing** link to access the Session Manager Routing Administration.

## 6.1. Configure Session Manager Details

Administration for the solution required the following steps:

- Add a Domain
- Add a Location
- Create an Adaptation Rule
- Add a SIP Entity
- Add an Entity Link
- Create a Routing Policy
- Create a Dial Pattern

### 6.1.1. Add a Domain

To add a domain, select **Domains** from the left hand window of the Routing screen and click on **New**. Configure a domain name and click on **Commit** (not shown) to complete adding a domain. Screen below shows a domain name of **bvwddev.com** that was added during compliance testing. Additional domains can be added in a similar fashion.

Avaya Aura® System Manager 6.3

Home / Elements / Routing / Domains

Domain Management

[New](#) [Edit](#) [Delete](#) [Duplicate](#) [More Actions](#)

Name	Type	Notes
<input type="checkbox"/> bvwddev.com	sip	The main domain

Select : All, None

### 6.1.2. Add a Location

To add a location, select **Locations** from the left hand window of the Routing screen and click on **New**. Configure a location name and click on **Commit** (not shown) to complete adding a location. Screen below shows a location name of **Belleville** that was added during compliance testing. Additional locations can be added in a similar fashion.

Avaya Aura® System Manager 6.3

Home / Elements / Routing / Locations

Location

[New](#) [Edit](#) [Delete](#) [Duplicate](#) [More Actions](#)

Name	Notes
<input type="checkbox"/> Belleville	Belleville Dev/Connect Location

Select : All, None

### 6.1.3. Create an Adaptation Rule

Session Manager used an Adaptation rule for two purposes. First, domains in the To and From headers were modified to reconcile differences in the *bvwdev* domain used on Session Manager and Communication Server 1000, and the IP Address of the Brekeke SIP (Rauland) Server used as the domain on that side of the call flow. For detail configuration details of various adaptations rules refer to **Section 10**

To add an adaptation, select **Adaptations** from the left hand window of the Routing screen. Click on **New** (not shown) to add an Adaptation rule. Screen below shows the adaptation details used during compliance testing.

**Adaption Name:** *ForRauland* – Any Descriptive name.

**Module name:** *DigitConversionAdapter* – Selected from the drop down menu.

**Module Parameter:** *fromto=true iodstd=bvwdev.com iosrcd=bvwdev.com osrcd=10.10.97.198 odstd=10.33.5.204* – this defines a rule to modify domains in SIP headers. 10.10.97.198 is the IP address of the Session Manager and 10.33.5.204 is the IP address of the Brekeke SIP (Rauland) Server used during compliance testing.

Click **Commit** to save the changes, then add the adaptation rule to the SIP Entity form that will be described in **Section 6.1.4**.

### 6.1.4. Add a SIP Entity

To add a SIP entity, select **SIP Entities** from the left hand window of the Routing screen and click on **New** (not shown). On the SIP Entity Details screen shown below which appears when the New button is pressed, enter the following values.

**Name:** Enter a descriptive name for the entity (*Rauland*).

**FQDN or IP Address:** *10.33.5.204* was the address used by the Brekeke SIP server during compliance testing.

**Type:** Select *Other* from the drop down menu.

**Notes:** Useful for quick glance identification on other screens.

**Adaptation:** Select *ForRauland* from the drop down menu. This adaptation rule was created in **Section 6.1.3**.

**SIP Link Monitoring:** Select *Link Monitoring Disabled* from the drop down menu. The Brekeke SIP Server does not use link monitoring.

**Entity Links:** This was added in a subsequent edit to the Entity record using the **Add** button but is described here for brevity purposes. See **Section 6.1.5** for how the Entity Link was created. Retain default values for other fields.

Click **Commit** to complete the entries on this screen.

SIP Entity 1	Protocol	Port	SIP Entity 2	Port	Connection Policy	Deny New Service
DevSM	UDP	5060	Rauland	5060	trusted	<input type="checkbox"/>

SIP Responses to an OPTIONS Request

Response Code & Reason Phrase	Mark Entity Up/Down	Notes
-------------------------------	---------------------	-------

### 6.1.5. Add Entity Links

To add an Entity Link, select **Entity Links** from the left hand window of the Routing screen and click on **New** (not shown). On the **Entity Links** screen shown below which appears when the New button is pressed, enter the following values.

**Name:** *DevSM\_Rauland\_5060* - A Descriptive name for the Entity Link.

**SIP Entity 1:** Select *DevSM* from the drop down menu – This is the existing Session Manager SIP Entity.

**SIP Entity 2:** Select *Rauland* from the drop down menu – This is the newly created SIP entity in Section 6.1.4.

**Protocol:** Select *UDP* from the drop down menu.

**Port:** *5060* – Port 5060 is the standard listen port for the UDP SIP transport protocol.

Retain default values for other fields.

Click **Commit** to save the entries.

Avaya Aura® System Manager 6.3

Select : All, None

## 6.1.6. Create a Routing Policy

Routing Policies require definition of a Routing Policy, and definition of Dial Patterns. A new Routing Policy is created first, leaving the Dial Pattern undefined, then a Dial Pattern is defined, then the Dial Pattern is applied to the Routing Policy.

To add a routing policy, select **Routing Policies** from the left hand window of the Routing screen and click on **New** (not shown). On the **Routing Policy Details** screen shown below which appears when the New button is pressed, enter the following values.

**Name** and **Notes** as desired for the policy.

Click the **Select** button to select the **SIP Entity as Destination** (not shown). The *Rauland* SIP Entity was selected as the Destination.

Retain default values for other fields.

Click **Commit** to save the entries.

Note that the **Dial Patterns** shown below was added when the **Dial Pattern** was defined in **Section 6.1.7** but is shown here for brevity.

### 6.1.7. Create a Dial Pattern

To add a dial pattern, select **Dial Patterns** from the left hand window of the Routing screen and click on **New** (not shown). On the **Dial Pattern Details** screen shown below which appears when the New button is pressed, enter the following values.

**Pattern:** 76 – Pilot number to reach the Rauland was defined as 76000 during compliance testing.

**Min and Max:** 5 – The number of digits in the dialed number to match.

**SIP Domain:** Select *bvwdev.com* from the drop down menu – The SIP Domain was configured in **Section 6.1.1**.

**Originating Locations and Routing Policies:** See the next page for details of this step. Retain default values for other fields.

Click on the **Commit** button to save the entries after the step on the following page is completed.

## 7. Configure Responder<sup>®</sup> 5

The Responder solution is typically implemented by Rauland engineers or their resale partners. When integrated with a third party SIP PBX, it is always deployed with a Brekeke SIP server which serves two purposes. First, Brekeke SIP server is commonly deployed with a variety of SIP capable PBX solutions giving the Responder equipment a common and predictable SIP interface that is adaptable to many environments. Second, the Brekeke SIP Server is capable of providing registrar services without requiring provisioning for each Responder endpoint thus significantly reducing the implementation and ongoing administration of the solution.

The Responder equipment will be provisioned completely by Rauland engineers based on site requirements, and will be configured to use the Brekeke SIP server for all calls destined to endpoints outside of the Responder endpoints.

The focus of this section will be on administration of the Responder applications, and configuration of the Brekeke SIP Server to properly route SIP calls and RTP.

## 7.1. Configure Brekeke SIP Server SIP Properties

The following SIP properties were pre-configured for the test environment.

All administration is performed via web browser by navigating to the hostname or IP Address of the Brekeke server.

The screenshot shows the 'SIP Server Admin' web interface. The left sidebar contains the following navigation links: Status, Active Sessions, Registered Clients, Dial Plan, Alarms, User Authentication, Block List, Logs, Configuration, Domains, Redundancy, and Maintenance. A 'Logout' button is located below these links.

The main content area is titled 'SIP' and contains the following configuration sections:

- SIP exchanger**
  - Session Limit (-1=unlimited): -1
  - Local Port: 5060
  - B2B-UA mode: ☐ on ☒ off
  - Check Maximum UDP packet size: ☐ on ☒ off

### 7.3. Configure RTP Relay Settings

The tested configuration required that all media (RTP) send to and from Rauland endpoints be connected through the Brekeke SIP Server. This was required in order to overcome an incompatibility between the Rauland and Avaya media servers as described in **Section 2**.

On the **RTP** screen, set **RTP Relay** to *on*, **RTP relay (UA on this machine)** to *auto*, **Port mapping** to *source port* and click **Save** to complete entries. Note that the **Minimum** and **Maximum Port** range settings should be sufficient to handle the maximum number of concurrent RTP sessions between systems.

## 8. Verification Steps

Calls were placed to and from Responder endpoints, and two-way audio was confirmed. The nature of these devices is simple, one-way communications with Hospital staff, complex calls like transfer and conference are not supported on the patient room devices, but Avaya endpoints were tested to confirm conference and transfer functionality.

## 9. Conclusion

These Application Notes describe the procedures required to configure Rauland-Borg Responder® 5 to interoperate with endpoints registered to Avaya Communication Server 1000 via Avaya Aura® Session Manager using a Brekeke SIP Server as a SIP registrar and Proxy for the Responder 5 side of the solution.

All feature functionality test cases described in **Section 2.1** were passed along with the observations noted in **Section 2.2**.
