# Application Notes for Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise with Verizon Business IP Trunk SIP Trunk Service – Issue 1.0

## Abstract

These Application Notes illustrate a sample configuration using Avaya Aura® Session Manager Release 6.2 and Avaya Aura® Communication Manager Release 6.2 with the Verizon Business Private IP (PIP) IP Trunk service. These Application Notes update previously published Application Notes with newer versions of Communication Manager and Session Manager. The Verizon Business SIP trunk redundant architecture (2-CPE) is supported by dual Avaya Session Border Controllers for Enterprise.

The Verizon Business IP Trunk service offer referenced within these Application Notes is designed for business customers with an Avaya SIP trunk solution. The service provides local and/or long distance PSTN calling via standards-based SIP trunks directly, without the need for additional TDM enterprise gateways or TDM cards and the associated maintenance costs.

**The configuration and software versions described in these Application Notes have not yet been independently certified by Verizon labs. These Application Notes can be used to facilitate customer engagements via the Verizon field trial process, pending Verizon labs independent certification.**

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab., utilizing a Verizon Business Private IP (PIP) circuit connection to the production Verizon Business IP Trunking service.

**NOTE:** This Application Note is applicable with Avaya Aura® 6.2 which is currently in Controlled Introduction. Avaya Aura® 6.2 will be Generally Available in Summer 2012.

# 1. Introduction

These Application Notes illustrate a sample configuration using Avaya Aura® Session Manager Release 6.2 and Avaya Aura® Communication Manager Release 6.2 with the Verizon Business Private IP (PIP) IP Trunk service. The Verizon Business IP Trunk service provides local and/or long-distance calls (with PSTN endpoints) via standards-based SIP trunks. These Application Notes update previously published Application Notes with newer versions of Communication Manager and Session Manager. The Verizon Business SIP trunk redundant architecture (2-CPE) is supported by dual Avaya Session Border Controllers for Enterprise (ASBCE). The Verizon Business SIP Trunk redundant (2-CPE) architecture provides for redundant SIP trunk access between the Verizon Business IP Trunk service offer and the customer premises equipment (CPE).

Dual ASBCEs are used as edge devices between the Avaya CPE and the Verizon Business network, and provide for Verizon Business 2-CPE redundancy. In addition, the ASBCEs provide Network Address Translation (NAT) functionality to convert the addresses used within the enterprise to the Verizon routable addresses.

**Note** - The Verizon Business SIP Trunk Redundant (2-CPE) architecture is a service option and its use is not a requirement of the Verizon Business IP Trunk service offer.

Verizon Business and Avaya developed the SIP Trunk Redundant (2-CPE) architecture to ensure that SIP trunk calls can be automatically re-routed to bypass SIP trunk failures due to network or component outages. The 2-CPE architecture described in these Application Notes is based on a customer location having two ASBCEs. One ASBCE is designated as Primary and one as Secondary.

Avaya Aura® Session Manager is provisioned for fail-over of outbound calls from one ASBCE to the other, if there is a failure (e.g., timeout, or error response) associated with the first choice. Similarly, the Verizon Business Private IP Trunk service node will send inbound calls to the Primary Avaya ASBCE if there is a failure (e.g., timeout, or error response), then the call will be sent to the Secondary ASBCE.

**The configuration and software versions described in these Application Notes have not yet been independently certified by Verizon labs. These Application Notes can be used to facilitate customer engagements via the Verizon field trial process, pending Verizon labs independent certification.**

## 2. General Test Approach and Test Results

### 2.1. Interoperability Compliance Testing

Compliance testing scenarios for the configuration described in these Application Notes included the following:

- Inbound and outbound voice calls between telephones controlled by Avaya Aura® Communication Manager and the PSTN can be made using G.711MU or G.729A codecs.
- Direct IP-to-IP Media (also known as “Shuffling”) when applicable.
- DTMF using RFC 2833
  - Outbound call to PSTN application requiring post-answer DTMF (e.g., an IVR or voice mail system)
  - Inbound call from PSTN to Avaya CPE application requiring post-answer DTMF (e.g., Avaya Modular Messaging, Avaya vector digit collection steps)
- Additional PSTN numbering plans (e.g., International, operator assist, 411)
- Hold / Retrieve with music on hold
- Call transfer using two approaches
  - REFER approach (Communication Manager Network Call Redirection flag on trunk group form set to “y”)
  - INVITE approach (Communication Manager Network Call Redirection flag on trunk group form set to “n”)
- Conference calls
- SIP Diversion Header for call redirection
  - Call Forwarding
  - EC500
- Long hold time calls
- Automatic fail-over testing associated with the 2-CPE redundancy (i.e., calls automatically re-routed around component outages).

### 2.2. Test Results

- When using an Avaya SIP phone with G.711 as the preferred codec and a call is established as G.711, when a re-invite is issued by Communication Manager for a shuffle, Verizon sends an ACK with just G.729 listed, so the SIP Phone will switch codecs to G.729. The user experience will not be affected and the calls stays connected.
- When a PSTN caller is transferred off-net (to another PSTN user) the 2<sup>nd</sup> PSTN phone will see the Caller-ID of the CPE phone.
- 2 – CPE testing. Although the Sipera will proxy OPTIONS messages from inside the network to outside, sourcing of OPTIONS must be turned on if a 2-CPE configuration is used or failover will not occur properly.

## 2.3. The SIP Trunk Redundant (2-CPE) Architecture Option

Verizon Business and Avaya developed the SIP Trunk Redundant (2-CPE) architecture to ensure that SIP trunk calls can be automatically rerouted to bypass SIP trunk failures due to network or component outages. The 2-CPE architecture described in these Application Notes is based on a customer location having two Avaya Session Border Controllers for Enterprise. One ASBCE is designated as Primary and one as Secondary. The ASBCEs reside at the edge of the customer network.

Avaya Aura® Session Manager is provisioned to attempt outbound calls to the Primary ASBCE first. If that attempt fails, the Secondary ASBCE is used. Similarly, the Verizon Business Private IP Trunk service node will send inbound calls to the Primary ASBCE. If there is no response then the call will be sent to the Secondary ASBCE.

## 2.4. Support

### 2.4.1 Avaya

For technical support on the Avaya products described in these Application Notes visit <http://support.avaya.com>

### 2.4.2 Verizon

For technical support on Verizon Business IP Trunk service offer, visit online support at <http://www.verizonbusiness.com/us/customer/>

## 2.5. Known Limitations

The following limitations are noted for the sample configuration described in these Application Notes:

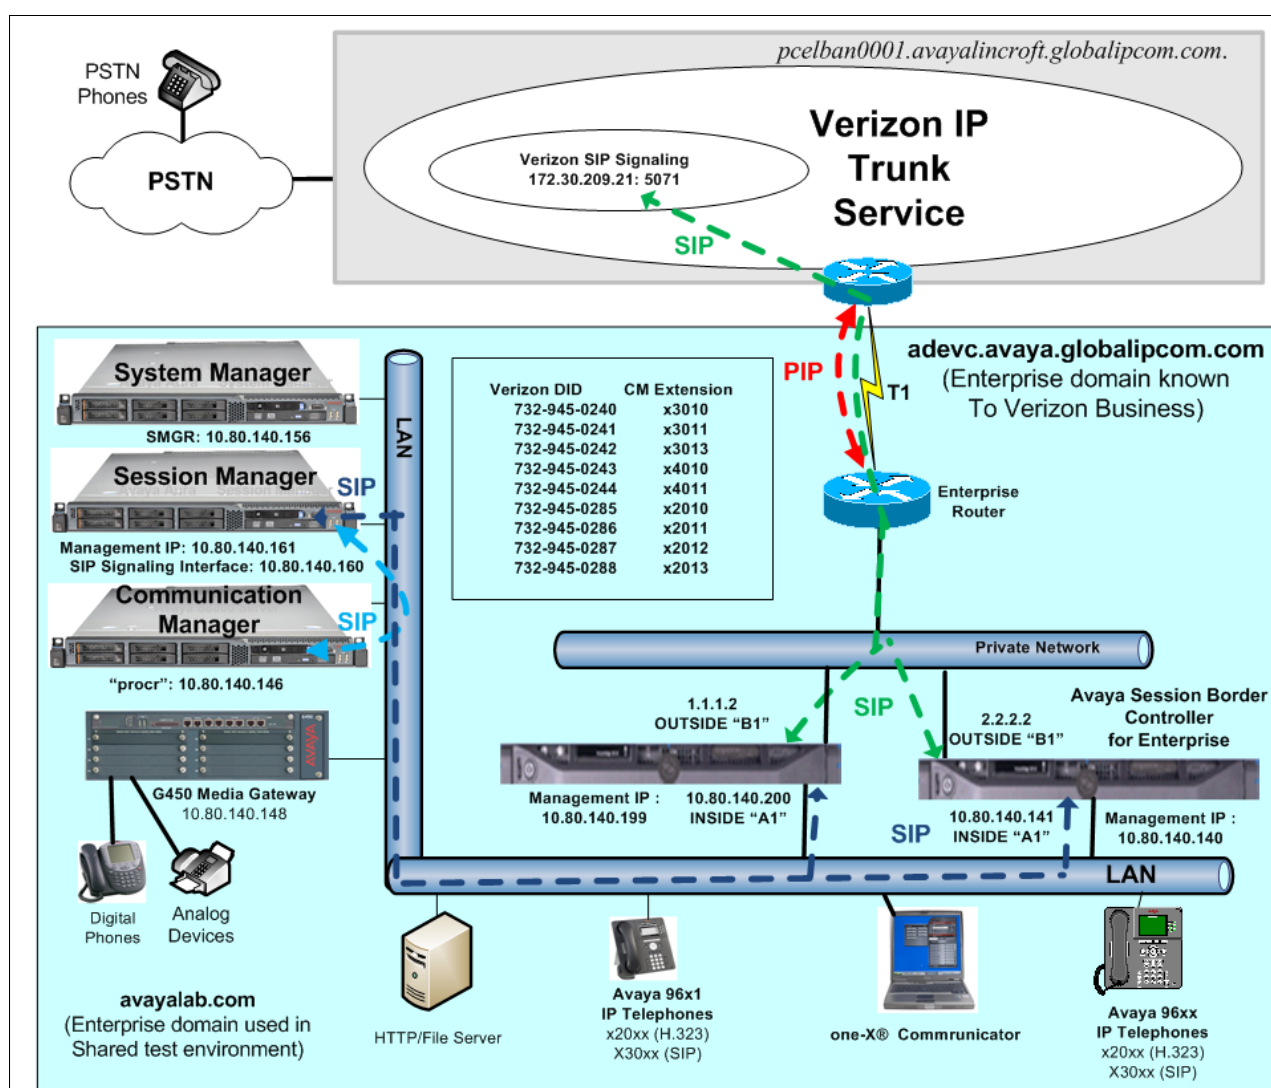

- Emergency 911/E911 Services Limitations and Restrictions - Although Verizon provides 911/E911 calling capabilities, 911 capabilities were not tested, therefore, it is Customer's responsibility to ensure proper operation with its equipment/software vendor.
- Verizon Business IP Trunking service does not support G.711a codec for domestic service (EMEA only).
- Verizon Business IP Trunking service does not support G.729B codec.

**Note** – These Application Notes describe the provisioning used for the sample configuration shown in **Figure 1**. Other configurations may require modifications to the provisioning described in this document.

### 3. Reference Configuration

**Figure 1** illustrates the sample configuration used for the testing. The Avaya CPE location simulates a customer site. The PIP service defines a secure MPLS connection between the Avaya CPE T1 connection and the Verizon service node.

The ASBCEs receive traffic from the Verizon Business IP Trunk service on port 5060 and send traffic to the Verizon Business IP trunk service on port 5071, using UDP protocol for network transport (required by the Verizon Business IP Trunk service). The Verizon Business IP Trunk service provided 10 digits Direct Inward Dial (DID) numbers. These DID numbers can be mapped by Avaya Aura® Session Manager or Avaya Aura® Communication Manager to Avaya telephone extensions.

**Figure 1: Avaya Interoperability Test Lab Configuration**

The Verizon Business IP Trunk service used FQDN *pcelban0001.avayalincroft.globalipcom.com*. The Avaya CPE environment was known to Verizon Business IP Trunk service as FQDN *adevc.avaya.globalipcom.com*. Access to the Verizon Business IP Trunk service was added to a configuration that already used domain “avayalab.com” at the enterprise. As such, Session Manager or the ASBCE are used to adapt the “avayalab.com” domain to the domain known to Verizon. These Application Notes indicate a configuration that would not be required in cases where the CPE domain in Communication Manager and Session Manager match the CPE domain known to the Verizon Business IP Trunk service.

**Note** – The Fully Qualified Domain Names and IP addressing specified in these Application Notes apply only to the reference configuration shown in **Figure 1**. Verizon Business customers will use their own FQDNs and IP addressing as required.

In summary, the following components were used in the reference configuration.

- Verizon Business IP Trunk network Fully Qualified Domain Name (FQDN)
  - *pcelban0001.avayalincroft.globalipcom.com*
- Avaya CPE Fully Qualified Domain Name (FQDN) known to Verizon
  - *adevc.avaya.globalipcom.com*
- Primary and Secondary Avaya Session Border Controllers for Enterprise.
- Avaya Aura® Communication Manager Release 6.2
- Avaya Aura® Session Manager Release 6.2
- Avaya 96X1 Series IP telephones using the SIP and H.323 software bundle.
- Avaya 9600 Series IP telephones using the SIP and H.323 software bundle.
- Avaya Digital Phones
- Avaya Analog Phones

### 3.1. History Info and Diversion Headers

The Verizon Business IP Trunk service does not support SIP History Info Headers. Instead, the Verizon Business IP Trunk service requires that SIP Diversion Header be sent for redirected calls. The Avaya Aura® Communication Manager SIP trunk group form provides options for specifying whether History Info Headers or Diversion Headers are sent.

If Avaya Aura® Communication Manager sends the History Info Header, Avaya Aura® Session Manager can convert the History Info header into the Diversion Header. This is performed by specifying the “*VerizonAdapter*” adaptation in Avaya Aura® Session Manager.

The Avaya Aura® Communication Manager Call Forwarding or Extension to Cellular (EC500) features may be used for the call scenarios testing Diversion Header.

## 4. Equipment and Software Validated

The following equipment and software were used in the sample configuration.

Equipment:	Software:
HP ProLiant DL360 G7	Avaya Aura® Communication Manager Release 6.2 load 823.0
HP ProLiant DL360 G7	Avaya Aura® System Manager 6.2
HP ProLiant DL360 G7	Avaya Aura® Session Manager 6.2
G450 Gateway	3.1.20.1
DELL 210 RII	Avaya Session Border Controller for Enterprise Version 4.0.5Q02
Avaya 9600-Series Telephones (H.323)	96xx-IPT-H323-R3_1_3-112211
Avaya 9600-Series Telephones (SIP)	96xx-IPT-SIP-R2_6_6_0-102111
Avaya 96X1- Series Telephones (SIP)	96x1-IPT-SIP-R6_0_3-120511
Avaya 96X1- Series Telephones (H323)	96x1-IPT-H323-R6_0_5-091911
Avaya One-X Communicator (H.323)	6.1.3.08_SP3-Patch2-35791
Avaya 2400-Series and 6400-Series Digital Telephones	N/A
Okidata Analog Fax	N/A

**Table 1: Equipment and Software Used in the Sample Configuration**

## 5. Configure Avaya Aura® Communication Manager Release 6.2

This section illustrates an example configuration allowing SIP signaling via the “Processor Ethernet” of the Avaya HP Server to Session Manager. In configurations that use an Avaya G650 Media Gateway, it is also possible to use an Avaya C-LAN in the Avaya G650 Media Gateway for SIP signaling to Session Manager.

**Note** - The initial installation, configuration, and licensing of the Avaya servers and media gateways for Communication Manager are assumed to have been previously completed and are not discussed in these Application Notes.

### 5.1. Verify Licensed Features

Communication Manager license file controls customer capabilities. Contact an authorized Avaya representative for assistance if a required feature needs to be enabled.

On **Page 2** of the *display system-parameters customer-options* form, verify that the **Maximum Administered SIP Trunks** is sufficient for the combination of trunks to the Verizon Business IP Trunk service offer and any other SIP applications. Each call from a non-SIP endpoint to the Verizon Business IP Trunk service uses one SIP trunk for the duration of the call. Each call from a SIP endpoint to the Verizon Business IP Trunk service uses two SIP trunks for the duration of the call.

IP PORT CAPACITIES	USED
Maximum Administered H.323 Trunks:	12000 0
Maximum Concurrently Registered IP Stations:	18000 3
Maximum Administered Remote Office Trunks:	12000 0
Maximum Concurrently Registered Remote Office Stations:	18000 0
Maximum Concurrently Registered IP eCons:	414 0
Max Concur Registered Unauthenticated H.323 Stations:	100 0
Maximum Video Capable Stations:	18000 0
Maximum Video Capable IP Softphones:	18000 0
<b>Maximum Administered SIP Trunks:</b>	<b>24000 40</b>
Maximum Administered Ad-hoc Video Conferencing Ports:	24000 0
Maximum Number of DS1 Boards with Echo Cancellation:	522 0
Maximum TN2501 VAL Boards:	128 0
Maximum Media Gateway VAL Sources:	250 1
Maximum TN2602 Boards with 80 VoIP Channels:	128 0
Maximum TN2602 Boards with 320 VoIP Channels:	128 0
Maximum Number of Expanded Meet-me Conference Ports:	300 0

On Page 3 of the *display system-parameters customer-options* form, verify that ARS is enabled.

## 5.2. Dial Plan

In the reference configuration the Avaya CPE environment uses four digit local extensions, such as 2xxx, 3xxx or 4xxx. Trunk Access Codes (TAC) are 3 digits in length and begin with \*. The Feature Access Code (FAC) to access ARS is the single digit 9. The Feature Access Code (FAC) to access AAR is the single digit 8. The dial plan illustrated here is not intended to be prescriptive; any valid dial plan may be used.

The dial plan is modified with the *change dialplan analysis* command as shown below.

change dialplan analysis						Page 1 of 12		
DIAL PLAN ANALYSIS TABLE								
Location: all						Percent Full: 1		
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type
1	3	fac

4	4	ext						
8	1	fac						
9	1	fac						
*	3	fac						
*1	4	dac						
#	3	fac						

## 5.3. Node Names

Node names are mappings of names to IP addresses that can be used in various screens. The following *change node-names ip* output shows relevant node-names in the sample configuration. As shown in bold, the node name for Session Manager is “**ASM6-2**” with IP address **10.80.140.160**. The node name and IP address for the Processor Ethernet “**procr**” is **10.80.140.146**.

change node-names ip		Page	1	of	2
IP NODE NAMES					
Name	IP Address				
ASM6-2	10.80.140.160				
Gateway1	10.80.140.1				
default	0.0.0.0				
procr	10.80.140.146				
procr6	::				

## 5.4. Processor Ethernet Configuration on HP Common Server

The **add ip-interface procr** or **change ip-interface procr** command can be used to configure the Processor Ethernet (PE) parameters. The following screen shows the parameters used in the reference configuration.

- Verify that **Enable Interface?**, **Allow H.323 Endpoints?**, and **Allow H248 Gateways?** Fields are set to **y**.
- Assign a network region (e.g. **1**).
- Use default values for the remaining parameters.

change ip-interface procr		Page 1 of 2

	Gatekeeper Priority: 5	
IPV4 PARAMETERS		
Node Name: procr	IP Address: 10.80.140.146	

## 5.5. Network Regions for Gateway, Telephones

Network regions provide a means to logically group resources. In the shared Communication Manager configuration used for the testing, the Avaya G450 Media Gateway is in region 1. To provide testing flexibility, network region 4 was associated with other components used specifically for the Verizon testing.

Non-IP telephones (e.g., analog, digital) derive network region and location configuration from the Avaya gateway to which the device is connected. The following display command shows that **Media Gateway 1** is an Avaya G450 Media Gateway configured for network region 1. It can also be observed that the **Controller IP Address** is the Avaya Processor Ethernet (10.80.140.146), and that the gateway IP address is 10.80.140.148. These fields are not configured in this screen, but just display the current information for the Media Gateway.

change media-gateway 1		Page 1 of 2

V6:					
V7:					
V8:	MM710		DS1 MM	Max Survivable IP Ext: 8	
V9:	gateway-announcements		ANN VMM		

IP telephones can be assigned a network region based on an IP address mapping. The network region can also associate the IP telephone to a location for location-based routing decisions. The following screen illustrates a subset of the IP network map configuration used to verify these Application Notes. If the IP address of a registering IP Telephone does not appear in the ip-network-map, the phone is assigned the network region of the “gatekeeper” (e.g., CLAN or PE) to which it registers. When the IP address of a registering IP telephone is in the ip-network-map, the phone is assigned the network region assigned by the form shown below. For example, the IP address 10.80.140.29 would be mapped to network region 1, based on the configuration in bold below. In production environments, different sites will typically be on different networks, and ranges of IP addresses assigned by the DHCP scope serving the site can be entered as one entry in the network map, to assign all telephones in a range to a specific network region.

change ip-network-map				Page 1 of 63	
IP ADDRESS MAPPING					
IP Address		Subnet Bits	Network Region	VLAN	Emergency Location Ext
FROM: 10.80.140.0		/24	1	n	
TO: 10.80.140.255					

The following screen shows IP Network Region 4 configuration. In the shared test environment, network region 4 is used to allow unique behaviors for the Verizon test environment. In this example, codec set 4 will be used for calls within region 4. The shared Avaya Interoperability Lab test environment uses the domain “avayalab.com” (i.e., for network region 1 including the region of the Processor Ethernet “procr”). However, to illustrate the more typical case where Communication Manager domain matches the enterprise CPE domain known to Verizon, the **Authoritative Domain** in the following screen is “adevc.avaya.globalipcom.com”, the domain known to Verizon, as shown in **Figure 1**. Even with this configuration, note that the domain in the PAI header sent by Communication Manager to Session Manager will contain “avayalab.com”, the domain of the Far-end of the Avaya signaling group. Session Manager will adapt “avayalab.com”

to “adevc.avaya.globalipcom.com” in the PAI header, and the ASBCE will adapt the Diversion header.

The following screen shows the inter-network region connection configuration for region 4. The first bold row shows that network region 4 is directly connected to network region 1, and that codec set 4 will also be used for any connections between region 4 and region 1. For configurations where multiple remote gateways are used, each gateway will typically be configured for a different region, and this screen can be used to specify unique codec or call admission control parameters for the pairs of regions. If a different codec should be used for inter-region connectivity than for intra-region connectivity, a different codec set can be entered in the **codec set** column for the appropriate row in the screen shown below. Once submitted, the configuration becomes symmetric, meaning that network region 1, Page 4 will also show codec set 4 for region 4 to region 1 connectivity.

change ip-network-region 4		Page 4 of 20

The following screen shows IP Network Region 1 configuration. In this example, codec set 1 will be used for calls within region 1 due to the Codec Set parameter on **Page 1**, but codec set 4 will be used for connections between region 1 and region 4 as noted previously. In the shared test environment, network region 1 was in place prior to adding the Verizon test environment and already used **Authoritative Domain** “avayalab.com”. Where necessary, Session Manager or the ASBCE will adapt the domain from “avayalab.com” to “adevc.avaya.globalipcom.com”.

<b>change ip-network-region 1</b>		<b>Page</b> 1 of 20

## 5.6. IP Codec Sets

The following screen shows the configuration for codec set 4, the codec set configured to be used for calls within region 4 and for calls between region 1 and region 4. In general, an IP codec set is a list of allowable codecs in priority order. Using the example configuration shown below, all calls to and from the PSTN via the SIP trunks would use G.729A, since G.729A is preferred by both Verizon and the Avaya ip-codec-set. Any calls using this same codec set that are between devices capable of the G.722-64K codec (e.g., Avaya 9600-Series IP Telephone) can use G.722. Note that if G.711MU is omitted from the list of allowed codecs in ip-codec-set 4, calls from Verizon that are answered by Avaya Modular Messaging will use G450 VoIP resources to convert from G.729a

(facing Verizon) to G.711MU (facing Modular Messaging). If G.711MU is included in ip-codec-set 4, then calls from Verizon that are answered by Modular Messaging will not use G450 VoIP resources, but rather be “ip-direct” using G.711MU from Modular Messaging to the inside of the ASBCE. Include G.711MU in the ip-codec-set if fax will be used.

change ip-codec-set 4				Page	1 of 2

3: G.729A	n	2	20		
4:					

## 5.7. SIP Signaling Groups

This section illustrates the configuration of the SIP Signaling Groups. Each signaling group has a **Group Type** of “sip”, a **Near-end Node Name** of “procr”, and a **Far-end Node Name** of “SM6-2”. In the example screens, the **Transport Method** for all signaling groups is “tcp”. In production, TLS transport between Communication Manager and Session Manager can be used. The **Enable Layer 3 Test** field is enabled on each of the signaling groups to allow Communication Manager to maintain the signaling group using the SIP OPTIONS method. Fields

that are not referenced in the text below can be left at default values, including **DTMF over IP** set to “rtp-payload”, which corresponds to RFC 2833.

The following screen shows signaling group 68. Signaling group 68 will be used for processing PSTN calls to / from Verizon via Session Manager. The **Far-end Network Region** is configured to region 4. Port 5062 has been configured as both the **Near-end Listen Port** and **Far-end Listen Port**. Session Manager will be configured to direct calls arriving from the PSTN with Verizon DID numbers to a route policy that uses a SIP entity link to Communication Manager specifying port 5062. The use of different ports is one means to allow Communication Manager to distinguish different types of calls arriving from the same Session Manager. In the sample configuration, the **Peer Detection Enabled** field was set to “n”. Other parameters may be left at default values. Note that the **Alternate Route Timer** that defaults to 6 seconds has been changed to 12 seconds, this timer impacts fail-over timing for outbound calls. If Communication Manager does not get an expected response, Look-Ahead Routing (LAR) can be triggered, after the expiration of the Alternate Route Timer.

change signaling-group 68		Page 1 of 2

	<b>Alternate Route Timer(sec): 12</b>	

The following screen shows signaling group 3, the signaling group to Session Manager that was in place prior to adding the Verizon IP Trunk configuration to the shared Avaya Solutions and Interoperability Test Lab configuration. This signaling group reflects configuration not specifically related to Verizon IP Trunk but will be used to enable SIP phones to register to Session Manager and to use features from Communication Manager. Again, the **Near-end Node Name** is “procr” and the **Far-end Node Name** is “ASM6-2”, the node name of the Session Manager. Unlike the signaling group used for the Verizon IP Trunk signaling, the **Far-end Network Region** is 1. The **Peer Detection Enabled** field is set to “y” and a peer Session Manager has been previously detected. The **Far-end Domain** is set to “avayalab.com” matching the configuration in place prior to adding the Verizon IP SIP Trunking configuration.

## 5.8. SIP Trunk Groups

This section illustrates the configuration of the SIP Trunks Groups corresponding to the SIP signaling groups from the previous section.

The following shows **Page 1** for trunk group 68, which will be used for incoming and outgoing PSTN calls from Verizon. The **Number of Members** field defines how many simultaneous calls are permitted for the trunk group. The **Service Type** field should be set to “public-ntwrk” for the trunks that will handle calls with Verizon. The **Direction** has been configured to “two-way” to allow incoming and outgoing calls only in the sample configuration.

change trunk-group 68			Page 1 of 21	
TRUNK GROUP				
Group Number: 68		Group Type: sip		CDR Reports: y
Group Name: To-ASM-Verizon		COR: 1	TN: 1	TAC: *168

Service Type: public-ntwrk		Auth Code? n		
Member Assignment Method: auto				
Signaling Group: 68				
Number of Members: 10				

The following screen shows **Page 2** for trunk group 68. All parameters shown are default values, except for the **Preferred Minimum Session Refresh Interval**, which has been changed from the default 600 to 900. Although not strictly necessary, some SIP products prefer a higher session refresh interval than Communication Manager default value, which can result in unnecessary SIP messages to re-establish a higher refresh interval for each call.

<b>change trunk-group 68</b>		<b>Page 2 of 21</b>
Group Type: sip

SCCAN? n	Digital Loss Group: 18	
<b>Preferred Minimum Session Refresh Interval(sec): 900</b>		
Delay Call Setup When Accessed Via IGAR? n		

The following screen shows **Page 3** for trunk group 68. All parameters except those in bold are default values. The **Numbering Format** will use “private” numbering, meaning that the private numbering table would be consulted for any mappings of Communication Manager extensions to alternate numbers to be sent to Session Manager. Optionally, replacement text strings can be configured using the “system-parameters features” screen, such that incoming “private” (anonymous) or “restricted” calls can display an Avaya-configured text string on called party telephones.

<b>change trunk-group 68</b>		<b>Page 3 of 21</b>

<b>Numbering Format: private</b>		
UUI Treatment: service-provider		
<b>Replace Restricted Numbers? y</b>		
<b>Replace Unavailable Numbers? y</b>		
Show ANSWERED BY on Display? Y		

The following screen shows **Page 4** for trunk group 68. The **PROTOCOL VARIATIONS** page is one reason why it can be advantageous to configure incoming calls from Verizon to arrive on specific signaling groups and trunk groups. The bold fields have non-default values. The **Convert 180 to 183 for Early Media** field was a new in Communication Manager Release 6. Verizon recommends that inbound calls to the enterprise result in a 183 with SDP rather than a 180 with SDP, and setting this field to “y” for the trunk group handling inbound calls from Verizon produces this result. Although not strictly necessary, the **Telephone Event Payload Type** has been set to 101 to match Verizon configuration. Setting the **Network Call Redirection** flag to “y” enables advanced services associated with the use of the REFER message, while also implicitly enabling Communication Manager to signal “send-only” media conditions for calls placed on hold at the enterprise site. If neither REFER signaling nor “send-only” media signaling is required, this field may be left at the default “n” value. In the testing associated with these Application Notes, transfer testing using REFER was successfully completed with the **Network Call Redirection** flag set to “y”, and transfer testing using INVITE was successfully completed with the **Network Call Redirection** flag set to “n”.

For redirected calls, Verizon supports the Diversion header, but not the History-Info header. Communication Manager can send the Diversion header by marking **Send Diversion Header** to “y”. Alternatively, Communication can send the History-Info header by setting **Support Request History** to “y”, and Session Manager can adapt the History-Info header to the Diversion header

using the “VerizonAdapter”. In the testing associated with these Application Notes, call redirection testing with Communication Manager sending Diversion Header was completed successfully. Communication Manager configuration was then changed, and call redirection testing with Communication Manager sending History-Info and Session Manager adapting to Diversion Header was completed successfully.

change trunk-group 68	Page 4 of 21
<p>PROTOCOL VARIATIONS</p> <p>Mark Users as Phone? n</p> <p>Prepend '+' to Calling Number? n</p> <p>Send Transferring Party Information? n</p> <p><b>Network Call Redirection? y</b></p> <p><b>Send Diversion Header? y</b></p> <p>Support Request History? n</p> <p><b>Telephone Event Payload Type: 101</b></p> <p><b>Convert 180 to 183 for Early Media? y</b></p> <p>Always Use re-INVITE for Display Updates? n</p> <p>Enable Q-SIP? N</p>	

The following screen shows **Page 1** for trunk group 3, the bi-directional “tie” trunk group to Session Manager that existed before adding the Verizon SIP Trunk configuration to the shared Avaya Interoperability Lab network. Recall that this trunk is used to enable SIP phones to use features from Communication Manager and to communicate with other Avaya applications, such as Avaya Modular Messaging, and does not reflect any unique Verizon configuration.

change trunk-group 3	Page 1 of 21
<p>TRUNK GROUP</p> <p><b>Group Number: 3</b>                      <b>Group Type: sip</b>                      CDR Reports: y</p> <p><b>Group Name: To_ASM6-2</b>                      COR: 1                      TN: 1                      <b>TAC: *103</b></p> <p>Direction: two-way                      Outgoing Display? n</p> <p>Dial Access? n                      Night Service:</p> <p>Queue Length: 0</p> <p><b>Service Type: tie</b>                      Auth Code? n</p> <p>Member Assignment Method: auto</p> <p><b>Signaling Group: 3</b></p> <p><b>Number of Members: 20</b></p>	

The following shows **Page 3** for trunk group 3. Note that this tie trunk group uses a “private” **Numbering Format**.

change trunk-group 3	Page 3 of 21
<p>TRUNK FEATURES</p> <p>ACA Assignment? n                      Measured: none</p> <p>Maintenance Tests? y</p> <p>Numbering Format: <b>private</b></p> <p>UI Treatment: service-provider</p> <p>Replace Restricted Numbers? n</p> <p>Replace Unavailable Numbers? n</p> <p>Modify Tandem Calling Number: no</p>	

The following screen shows **Page 4** for trunk group 3. Note that unlike the trunks associated with Verizon calls that have non-default “protocol variations”, this trunk group maintains all default values. **Support Request History** must remain set to the default “y” to support proper subscriber mailbox identification by Modular Messaging.

<b>change trunk-group 3</b>	<b>Page 4 of 21</b>

N	

## 5.9. Route Pattern Directing Outbound Calls to Verizon

Route pattern 68 will be used for calls destined for the PSTN via the Verizon IP Trunk service. Digit manipulation can be performed on the called number, if needed, using the **No. Del Dgts** and **Inserted Digits** parameters. Digit manipulation can also be performed by Session Manager.

If desired, one or more alternate Communication Manager trunks can be listed in the route pattern so that the Look-Ahead Routing (**LAR**) “next” setting can route-advance to attempt to complete the call using alternate trunks should there be no response or an error response from the far-end.

<b>change route-pattern 68</b>	<b>Page 1 of 3</b>

## 5.10. Route Pattern for Internal Calls via Session Manager

Route pattern 3 contains trunk group 3, the “private” tie trunk group to Session Manager. The **Numbering Format: lev0-pvt** means all calls using this route pattern will use the private numbering table.

change route-pattern 3										Page 1 of 3

4:	y	y	y	y	y	n	n	rest			none	

## 5.11. Private Numbering

The *change private-unknown-numbering* command may be used to define the format of numbers sent to Verizon in SIP headers such as the “From” and “PAI” headers. In general, the mappings of internal extensions to Verizon DID numbers may be done in Communication Manager (via public-unknown-numbering, and incoming call handling treatment for the inbound trunk group).

In the bolded row shown in the example abridged output below, a specific Communication Manager extension (x2010) is mapped to a DID number that is known to Verizon for this SIP Trunk connection (7329450285), when the call uses trunk group 68. Alternatively, Communication Manager can send the five digit extension to Session Manager, and Session Manager can adapt the number to the Verizon DID. Both methods were tested successfully.

<b>change private-numbering 0</b>					Page 1 of 2
NUMBERING - PRIVATE FORMAT					
Ext	Ext	Trk	Private	Total

4	3013	68	7329450242	10	
4	3688	68	7329450228	10	
4	4010	68	7329450243	10	

## 5.12. ARS Routing For Outbound Calls

Although not illustrated in these Application Notes, location-based routing may be configured so that users at different locations that dial the same telephone number can have calls choose different route-patterns. Various example scenarios for a multi-location network with failover routing are provided in reference [PE]. In these Application Notes, the ARS “all locations” table directs ARS calls to specific SIP Trunks to Session Manager.

The following screen shows a specific ARS configuration as an example. If a user dials the ARS access code followed by 13035387024, the call will select route pattern 68. Of course, matching of the dialed string need not be this specific. The ARS configuration shown here is not intended to be prescriptive.

change ars analysis 13035387022						Page 1 of 2
ARS DIGIT ANALYSIS TABLE						
Location: all						Percent Full: 1
Dialed String	Total Min	Total Max	Route Pattern	Call Type	Node Num	ANI Req'd
13035387024	11	11	68	hnpa		n

The *list ars route-chosen* command can be used on a target dialed number to check whether routing will behave as intended. An example is shown below.

list ars route-chosen 13035387024						
ARS ROUTE CHOSEN REPORT						
Location: 1			Partitioned Group Number: 1			
Dialed String	Total Min	Total Max	Route Pattern	Call Type	Node Number	Location
13035387024	11	11	68	hnpa		all
Actual Outpulsed Digits by Preference (leading 35 of maximum 42 digit)						
1: 13035387024						

### 5.13. Incoming Call Handling Treatment for Incoming Calls

In general, the “incoming call handling treatment” for a trunk group can be used to manipulate the digits received for an incoming call if necessary. Since Session Manager is present, Session Manager can also be used to perform digit conversion, and digit manipulation and Communication Manager incoming call handling table may not be necessary. If the DID number sent by Verizon is unchanged by Session Manager, then the DID number can be mapped to an extension using the incoming call handling treatment of the receiving trunk group. As an example, the following screen illustrates a conversion of DID number 7329450240 to extension 3010. Both Session Manager digit conversion and Communication Manager incoming call handling treatment methods were tested successfully.

change inc-call-handling-trmt trunk-group 68					Page 1 of 30

## 5.15. EC500 Configuration for Diversion Header Testing

When EC500 is enabled for a Communication Manager station, a call to that station will generate a new outbound call from Communication Manager to the configured EC500 destination, typically a mobile phone. The following screen shows an example EC500 configuration for the user with station extension 2010. Use the command ***change off-pbx-telephone station mapping x*** where *x* is Communication Manager station (e.g. 2010).

- **Station Extension** – This field will automatically populate
- **Application** – Enter “EC500”
- **Dial Prefix** – Enter a prefix (e.g., 1) if required by the routing configuration
- **Phone Number** – Enter the phone that will also be called (e.g., 3035387024)
- **Trunk Selection** – Enter “ars”. This means ARS will be used to determine how Communication Manager will route to the **Phone Number** destination.
- **Config Set** – Enter “1”
- Other parameters can retain default values

change off-pbx-telephone station-mapping 2010							Page	1 of	3

## 5.16. Saving Communication Manager Configuration Changes

The command *save translation all* can be used to save the configuration.

## 6. Configure Avaya Aura® Session Manager Release 6.2

This section illustrates relevant aspects of the Session Manager configuration used in the verification of these Application Notes.

**Note** – The following sections assume that Session Manager and System Manager have been installed and that network connectivity exists between System Manager and Session Manager.

Session Manager is managed via System Manager. Using a web browser, access “https://<ip-addr of System Manager>/SMGR”. In the **Log On** screen, enter appropriate **User ID** and **Password** and press the **Log On** button as shown in the example System Manager 6.2 **Log On** screen below.

Recommended access to System Manager is via FQDN.  
[Go to central login for Single Sign-On](#)

If IP address access is your only option, then note that authentication will fail in the following cases:

- First time login with "admin" account
- Expired/Reset passwords

Once logged in, a **Home Screen** is displayed. An abridged **Home Screen** is shown below.

Under the heading “Elements” in the center, select **Routing**. The screen shown below shows the various sub-headings available on the left hand side menu.

The right side of the screen, illustrated below, outlines a series of steps. The sub-sections that follow are in the same order as the steps outlined under **Introduction to Network Routing Policy** in the abridged screen shown below.

### Introduction to Network Routing Policy

Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.

The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:

Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).

Step 2: Create "Locations"

Step 3: Create "Adaptations"

Step 4: Create "SIP Entities"

- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)
- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"

Step 5: Create the "Entity Links"

- Between Session Managers
- Between Session Managers and "other SIP Entities"

Step 6: Create "Time Ranges"

- Align with the tariff information received from the Service Providers

Step 7: Create "Routing Policies"

- Assign the appropriate "Routing Destination" and "Time Of Day"
- (Time Of Day = assign the appropriate "Time Range" and define the "Ranking")

Step 8: Create "Dial Patterns"

- Assign the appropriate "Locations" and "Routing Policies" to the "Dial Patterns"

Step 9: Create "Regular Expressions"

- Assign the appropriate "Routing Policies" to the "Regular Expressions"

Scroll down to review additional information as shown below. In these Application Notes, all steps are illustrated with the exception of Step 9, since “Regular Expressions” were not used.

Each "Routing Policy" defines the "Routing Destination" (which is a "SIP Entity") as well as the "Time of Day" and its associated "Ranking".

**IMPORTANT:** the appropriate dial patterns are defined and assigned afterwards with the help of the routing application "Dial patterns". That's why this overall routing workflow can be interpreted as

#### "Dial Pattern driven approach to define Routing Policies"

That means (with regard to steps listed above):

Step 7: "Routing Policies" are defined

Step 8: "Dial Patterns" are defined and assigned to "Routing Policies" and "Locations" (one step)

Step 9: "Regular Expressions" are defined and assigned to "Routing Policies" (one step)

## 6.1. Domains

To view or change SIP domains, select **Routing → Domains**. Click on the checkbox next to the name of the SIP domain and **Edit** to edit an existing domain, or the **New** button to add a domain. Click the **Commit** button after changes are completed.

The following screen shows a list of configured SIP domains. The Session Manager used in the verification of these Application Notes was shared among other Avaya interoperability test efforts. The domain “avayalab.com” was used for communication with Avaya SIP Telephones and other Avaya systems and applications. The domain “avayalab.com” is not known to the Verizon production service.

Home / Elements / Routing / Domains

## 6.2. Locations

To view or change locations, select **Routing → Locations**. The following screen shows an abridged list of configured locations. Click on the checkbox corresponding to the name of a location and **Edit** to edit an existing location, or the **New** button to add a location. Click the **Commit** button after changes are completed. Assigning unique locations can allow Session Manager to perform location-based routing, bandwidth management, and call admission control.

### 6.3. Adaptations

To view or change adaptations, select **Routing** → **Adaptations**. Click on the checkbox corresponding to the name of an adaptation and **Edit** to edit an existing adaptation, or the **New** button to add an adaptation. Click the **Commit** button after changes are completed (not shown).

The following screen shows a portion of the list of adaptations that were available in the sample configuration, not all of which are applicable to these Application Notes.

[Home](#) / [Elements](#) / [Routing](#) / [Adaptations](#)

**Adaptations**

5 Items | [Refresh](#)

<input type="checkbox"/>	Name	Module name
<input type="checkbox"/>	<a href="#">CM-ES-VZ</a>	DigitConversionAdapter odst=avayalab.com
<input type="checkbox"/>	<a href="#">CM-ES-VZ-IPCC</a>	DigitConversionAdapter odst=avayalab.com fromto=true
<input type="checkbox"/>	<a href="#">History_Diversion_IPT</a>	VerizonAdapter osrcd=adevc.avaya.globalipcom.com odst=pcelban0001.avayalincroft.globalipcom.com fromto=true
<input type="checkbox"/>	<a href="#">SBC-VzB-IPCC</a>	DigitConversionAdapter osrcd=adevc.avaya.globalipccom.com
<input type="checkbox"/>	<a href="#">Verizon_Test</a>	VerizonAdapter osrcd=adevc.avaya.globalipcom.com odst=pcelban0001.avayalincroft.globalipcom.com

The following screen shows the adaptation details. The adapter named “History\_Diversion\_IPT” will later be assigned to the SIP Entity for the ASBCE, specifying that all communication from the Session Manager to the ASBCE will use this adapter. This adaptation uses the “VerizonAdapter” and specifies three parameters that are used to adapt the FQDN to the domains expected by the Verizon network in the sample configuration. Again, this may not be required in all networks, but is used here to adapt the avayalab.com domain that is used in the shared test environment among other Avaya interoperability test efforts.

The “**Module parameter:**” line contains the following line:

**osrcd=adevc.avaya.globalipcom.com odstd=pcelban0001.avayalincroft.globalipcom.com  
fromto=true**

- **overrideSourceDomain** : “**osrcd=adevc.avaya.globalipcom.com**”. This configuration enables the source domain to be overwritten with “adevc.avaya.globalipcom.com”. For example, for outbound PSTN calls from the Avaya CPE to Verizon, the PAI header will contain “adevc.avaya.globalipcom.com” as expected by Verizon.
- **overrideDestinationDomain** : “**odstd=pcelban0001.avayalincroft.globalipcom.com**”  
This configuration enables the destination domain to be overwritten with “pcelban0001.avayalincroft.globalipcom.com”. For example, for outbound PSTN calls from the Avaya CPE to Verizon, the Request-URI header will contain “pcelban0001.avayalincroft.globalipcom.com” as expected by Verizon.
- **Fromto**: The parameter “**fromto=true**” enables Session to modify From and To headers of the message. If omitted or set to any other value, From and To headers will not be modified.

The ”History\_Diversion\_IPT” Module Parameter statement above is overriding avayalab.com with the FQDNs know by Verizon towards the ASBCE. It is also necessary to override the FQDNs known to Verizon back to avayalab.com towards Communication Manager. This could be done on the next Adaptation “CM-ES-VZ” with the same parameters odstd and osrcd or here in the ”History\_Diversion\_IPT” adapter with the statements:

- **ingressOverrideDestinationDomain**: “**iodstd=avayalab.com**”
- **ingressOverrideDestinationDomain**: “**iosrcd=avayalab.com**”

However, in this configuration, that is being done in the ASBCE to show multiple locations to override the domain.

<input type="checkbox"/>	<a href="#">CM-Evolution-procr-5063</a>	10.80.140.146	CM	CM-ES procr IP, different port

Select : All, None

The following screen shows the upper portion of the **SIP Entity Details** corresponding to “ASM-62”. The **FQDN or IP Address** field for “ASM-62” is the Session Manager Security Module IP Address (10.80.140.160), which is used for SIP signaling with other networked SIP entities. The **Type** for this SIP entity is “Session Manager”. Select an appropriate location for the Session Manager from the **Location** drop-down menu. In the shared test environment, the Session Manager used location “Location\_140”. The default **SIP Link Monitoring** parameters may be used. Unless changed elsewhere, links from other SIP entities to this instance of Session Manager will use the default SIP Link Monitoring timers, configurable at the Session Manager level. If desired, these timers may be customized for each entity.

Credential name:	
Call Detail Recording:	none
<b>SIP Link Monitoring</b>	
SIP Link Monitoring:	Use Session Manager Configuration

The following screen shows the **SIP Entity Details** for an entity named “CM-Evolution-procr-5062”. This entity uses the same **FQDN or IP Address** (10.80.140.146) as the prior entity with name “CM6.2”; both correspond to Communication Manager Processor Ethernet IP Address. Later, a unique port, 5062, will be used for the Entity Link to “CM-Evolution-procr-5062”. Using a different port is one approach that will allow Communication Manager to distinguish traffic originally from Verizon IP Trunk from other SIP traffic arriving from the same IP Address of the Session Manager, such as SIP traffic associated with SIP Telephones or other SIP-integrated applications. If desired, a location can be assigned if location-based routing criteria will be used.

SIP Link Monitoring: Use Session Manager Configuration

## 6.5. Entity Links

To view or change Entity Links, select **Routing → Entity Links**. Click on the checkbox corresponding to the name of a link and **Edit** to edit an existing link, or the **New** button to add a link. Click the **Commit** button after changes are completed.

**Note** – In the Entity Link configurations below (and in Communication Manager SIP trunk configuration), TCP was selected as the transport protocol for the CPE in the sample configuration. TCP was used to facilitate trace analysis during network verification. TLS may be used between Communication Manager and Session Manager in customer deployments.

The following screen shows a list of configured links. In the screen below, the links named “Sipera-SBC-1”, “Sipera-SBC-2” and “CM-ES-VZ-5062” are most relevant to these Application Notes. Each link uses the entity named “ASM-62” as **SIP Entity 1**, and the appropriate entity, such as “Avaya-SBCE-1”, for **SIP Entity 2**. Note that there are multiple SIP Entity Links, using different TCP ports, linking the same “ASM-62” with the processor Ethernet of Communication Manager. For example, for one link, named “ASM\_to\_CM”, both entities use TCP and port 5060. For the entity link used by Verizon IP Trunk named “CM-ES-VZ-5062”, both entities use TCP and port 5062.

Home / Elements / Routing / Entity Links								
Entity Links								
<input type="button" value="Edit"/> <input type="button" value="New"/> <input type="button" value="Duplicate"/> <input type="button" value="Delete"/> <input type="button" value="More Actions"/>								
5 Items   <a href="#">Refresh</a> <span style="float: right;">Filter: E</span>								
<input type="checkbox"/>	Name	SIP Entity 1	Protocol	Port	SIP Entity 2	Port	Connection Policy	Notes
<input type="checkbox"/>	<a href="#">ASM_to_CM</a>	ASM-62	TCP	<a href="#">5060</a>	CM6.2	<a href="#">5060</a>	Trusted	
<input type="checkbox"/>	<a href="#">CM-ES-VZ-5062</a>	ASM-62	TCP	<a href="#">5062</a>	CM-Evolution-procr-5062	<a href="#">5062</a>	Trusted	<a href="#">VS IPT</a>
<input type="checkbox"/>	<a href="#">CM-ES-VZ-5063</a>	ASM-62	TCP	<a href="#">5063</a>	CM-Evolution-procr-5063	<a href="#">5063</a>	Trusted	<a href="#">VZ IPCC</a>
<input type="checkbox"/>	<a href="#">Sipera-SBC-1</a>	ASM-62	TCP	<a href="#">5060</a>	Avaya-SBCE-1	<a href="#">5060</a>	Trusted	<a href="#">SBC-Outside-2222</a>
<input type="checkbox"/>	<a href="#">Sipera-SBC-2</a>	ASM-62	TCP	<a href="#">5060</a>	Avaya-SBCE-2	<a href="#">5060</a>	Trusted	<a href="#">SBC-Outside-1112</a>

The link named “ASM\_to\_CM” links Session Manager “ASM-62” with Communication Manager processor Ethernet. This link existed in the configuration prior to adding the Verizon IP Trunk related configuration. This link, using port 5060, can carry traffic between Session Manager and Communication Manager that is not necessarily related to calls with Verizon, such as traffic related to SIP Telephones registered to Session Manager.

The link named “CM-ES-VZ-5062” also links Session Manager “ASM-62” with Communication Manager processor Ethernet. However, this link uses port 5062 for both entities in the link. This link was created to allow Communication Manager to distinguish calls from Verizon IP Trunk from other calls that arrive from the same Session Manager. Other methods of distinguishing traffic could be used, if desired.

## 6.6. Time Ranges

To view or change Time Ranges, select **Routing → Time Ranges**. The Routing Policies shown subsequently will use the “24/7” range since time-based routing was not the focus of these Application Notes. Click the **Commit** button (not shown) after changes are completed.

Select : All, None

The following screen shows the **Routing Policy Details** for the policy named “Avaya-SBCE-2-to-Verizon” associated with outgoing calls from Communication Manager to the PSTN via Verizon through the ASBCE. Observe the **SIP Entity as Destination** is the entity named “Avaya-SBCE-2”. In the **Time of Day** area, note that a **Ranking** can be configured. To allow the “Avaya-SBCE-2” to receive calls from Session Manager even when the “Avaya-SBCE-1” is operational, the default rank of 0 (also assigned to “Avaya-SBCE-1”) can be retained.

Select : All, None

If it is intended that “Avaya-SBCE-1” should always be tried by Session Manager before “Avaya-SBCE-2”, the rank of “Avaya-SBCE-2” can be changed to 1 as shown below. Both the “load sharing” approach where “Avaya-SBCE-1” and “Avaya-SBCE-2” use the same rank, and the strict rank order priority of “Avaya-SBCE-1” over “Avaya-SBCE-2” were successfully tested in the sample configuration.

## 6.8. Dial Patterns

To view or change dial patterns, select **Routing → Dial Patterns**. Click on the checkbox corresponding to the name of a pattern and **Edit** to edit an existing pattern, or **New** to add a pattern. Click the **Commit** button after changes are completed.

### 6.8.1 Inbound Call Dial Pattern

The following screen illustrates an example dial pattern used to verify inbound PSTN calls to the enterprise. When a user on the PSTN dials a number assigned to the Verizon IP Trunk service, such as 732-945-0240, Verizon delivers the number to the enterprise, and the ASBCE sends the call to Session Manager. The pattern below matches on 732-945-0240 specifically. Dial patterns can alternatively match on ranges of numbers (e.g., a DID block). Under **Originating Locations and Routing Policies**, the routing policy named “CM-ES-VZ\_IPT” is selected, which sends the call to Communication Manager using port 5062 as described previously. In the Avaya Interoperability Lab configuration, calls to this number from any of the two originating locations, including the one with **Originating Location Name** “Avaya-SBCE-1”, are routed to Communication Manager.

## 6.8.2 Outbound Call Dial Pattern

The following screen illustrates an example dial pattern used to verify outbound calls from the enterprise to the PSTN. When a Communication Manager user dials a PSTN number such as 9-1-303-XXX-XXX, Communication Manager sends the call to Session Manager, via the HP Common Server Processor Ethernet. Session Manager will match the dial pattern shown below and send the call to the “Avaya-SBCE-1” or the “Avaya-SBCE-2” via the **Routing Policy Name** “Avaya-SBCE-1-to-Verizon” and “Avaya-SBCE-2-to-Verizon”.

Select : All, None

In the alternative screen shown below, the routing policy associated with the “Avaya-SBCE-2” for the number 19088485704, has a rank of 1. With this configuration, all calls will use “Avaya-SBCE-1” first, and only try “Avaya-SBCE-2” if the call attempt through “Avaya-SBCE-1” is unsuccessful. Session Manager can be configured to distribute the calls among the ASBCEs (same rank) or prefer one ASBCE over another (different ranks).

## 7. Avaya Session Border Controller for Enterprise

In the sample configuration, an ASBCE is used as the edge device between the CPE and Verizon Business.

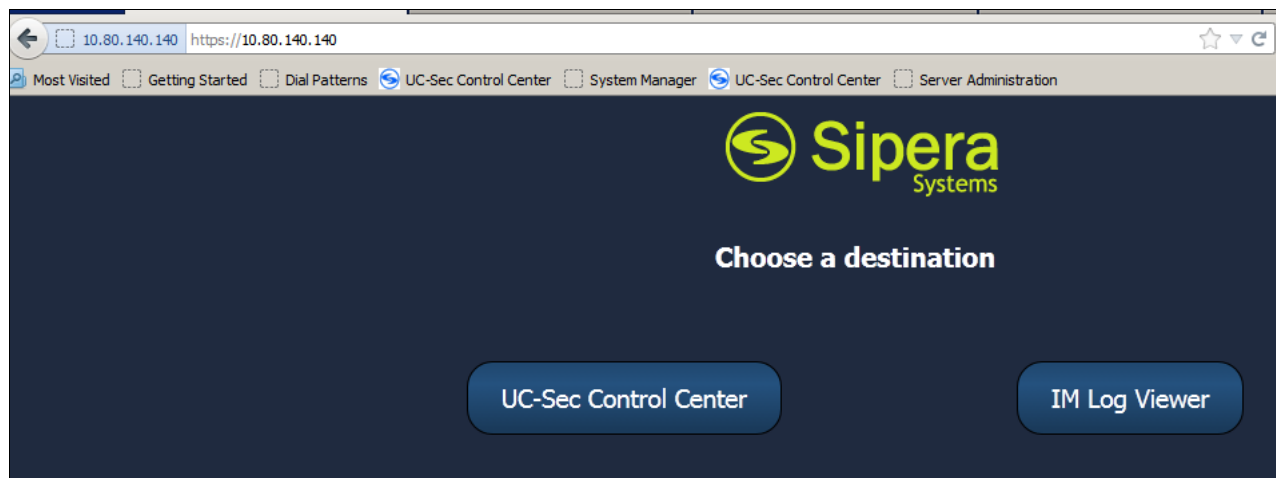

These Application Notes assume that the installation of the ASBCE and the assignment of a management IP Address have already been completed.

As described in **Section 1**, Verizon Business IP Trunking supports a redundant (2-CPE) architecture that provides for redundant SIP trunk access between the Verizon Business IP Trunk service offer and the SIP trunk architecture customer premises equipment (CPE). In the reference configuration two (ASBCEs) were used to provide the 2-CPE redundant access.

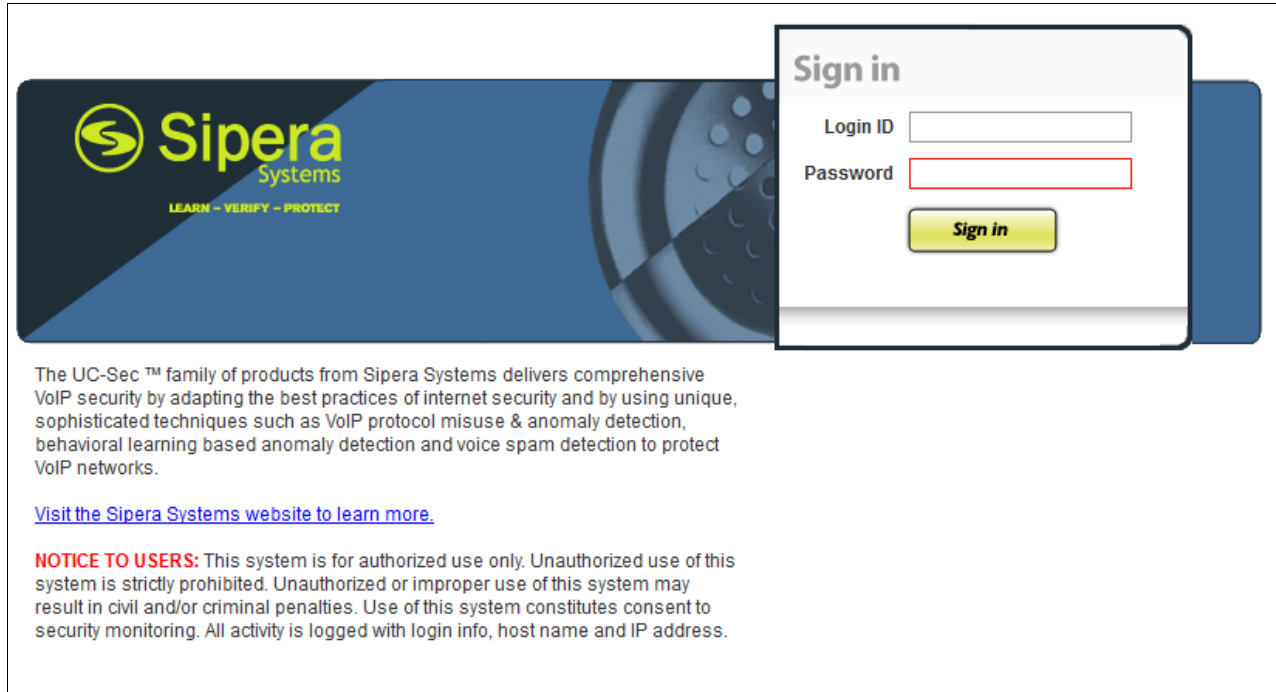

**Note** – The following Sections describe the provisioning of the Primary ASBCE. The configuration of the Secondary ASBCE is identical unless otherwise noted (e.g. IP addressing).

### 7.1. Access the Management Interface

In the sample configuration, the management IP is 10.80.140.140. Access the web management interface by entering <https://<ip-address>> where <ip-address> is the management IP address assigned during installation. Select **UC-Sec Control Center**.

A log in screen is presented. Enter an appropriate **Login ID** and **Password**.

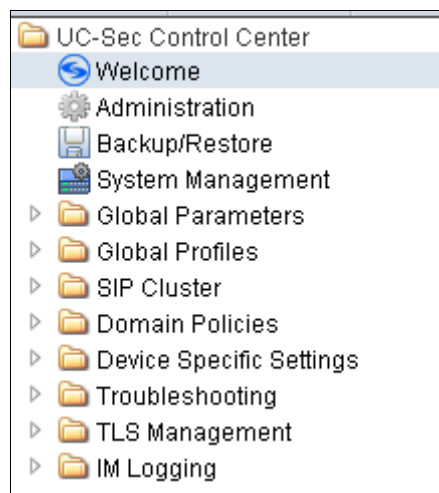

The login screen features the Sipera Systems logo on the left, which includes a green circular icon with a stylized 'S' and the text 'Sipera Systems' and 'LEARN - VERIFY - PROTECT'. On the right is a 'Sign in' form with fields for 'Login ID' and 'Password', and a yellow 'Sign in' button. Below the banner, there is a paragraph of text about the UC-Sec family of products, a link to the Sipera Systems website, and a 'NOTICE TO USERS' section.

The UC-Sec™ family of products from Sipera Systems delivers comprehensive VoIP security by adapting the best practices of internet security and by using unique, sophisticated techniques such as VoIP protocol misuse & anomaly detection, behavioral learning based anomaly detection and voice spam detection to protect VoIP networks.

[Visit the Sipera Systems website to learn more.](#)

**NOTICE TO USERS:** This system is for authorized use only. Unauthorized use of this system is strictly prohibited. Unauthorized or improper use of this system may result in civil and/or criminal penalties. Use of this system constitutes consent to security monitoring. All activity is logged with login info, host name and IP address.

Once logged in, a UC-Sec Control Center screen will be presented. The following image illustrates the menu items available on the left-side of the UC-Sec Control Center screen.

## 7.2. Commission the System

From the **UC-Sec Control Center** menu, select **System Management**.

If the system has not yet been “commissioned”, a screen such as the following will appear. The **Status** will show “Registered”. Run the installation wizard by clicking the  icon.

Device Name	Serial Number	Version	Status
SS_10_80_140_140	IPCS31020091	4.0.5Q02	Registered

An installation wizard will appear. In the **Appliance Name** field, enter an appropriate name. In the sample configuration, “VZ\_1” was entered. In the **Choose your box type** area, choose SIP. Click **Next**.

**Installation Wizard**

After clicking **Finish (shown above)**, a screen such as the following will be displayed. The administrator may click the links such as **Server Configuration** to continue system configuration, or close the window to return to the UC-Sec Control Center Welcome Screen menu shown below.

Welcome Screen:

Once the wizard has been completed, the **System Management** screen will show **Status** "Commissioned" as shown below.

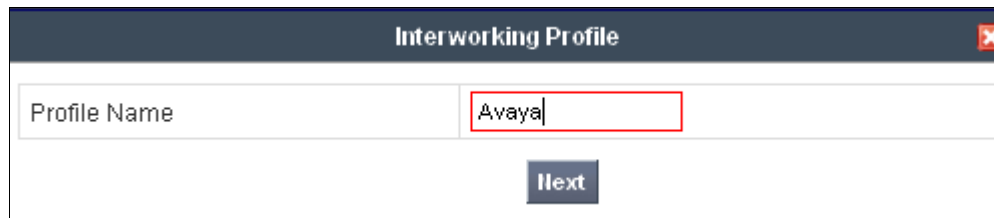

## 7.3. Global Profiles – Server Interworking

Select **Global Profiles** → **Server Interworking** from the left-side menu as shown below.

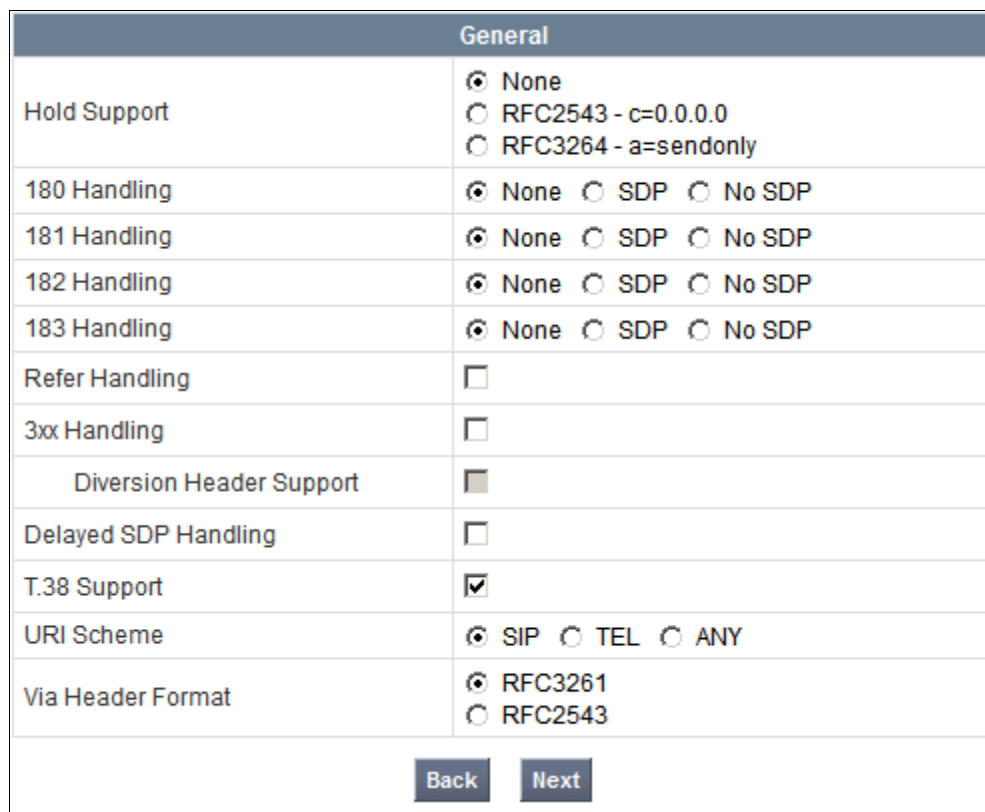

### 7.3.1 Server Interworking - Avaya

Click the **Add Profile** button (not shown) to add a new profile or select an existing interworking profile. If adding a profile, a screen such as the following is displayed. Enter an appropriate **Profile Name** such as “Avaya” shown below. Click **Next**.

Interworking Profile	
Profile Name	Avaya
<b>Next</b>	

The following screens illustrate the “General” parameters used in the sample configuration for the Interworking Profile named “Avaya”. Most parameters retain default values. In the sample configuration, **T.38 support** was checked (optional), and **Hold Support** was set for RFC3261.

General	
Hold Support	<input checked="" type="radio"/> None <input type="radio"/> RFC2543 - c=0.0.0.0 <input type="radio"/> RFC3264 - a=sendonly
180 Handling	<input checked="" type="radio"/> None <input type="radio"/> SDP <input type="radio"/> No SDP
181 Handling	<input checked="" type="radio"/> None <input type="radio"/> SDP <input type="radio"/> No SDP
182 Handling	<input checked="" type="radio"/> None <input type="radio"/> SDP <input type="radio"/> No SDP
183 Handling	<input checked="" type="radio"/> None <input type="radio"/> SDP <input type="radio"/> No SDP

## 7.4. Global Profiles – Routing

Select **Global Profiles** → **Routing** from the left-side menu as shown below.

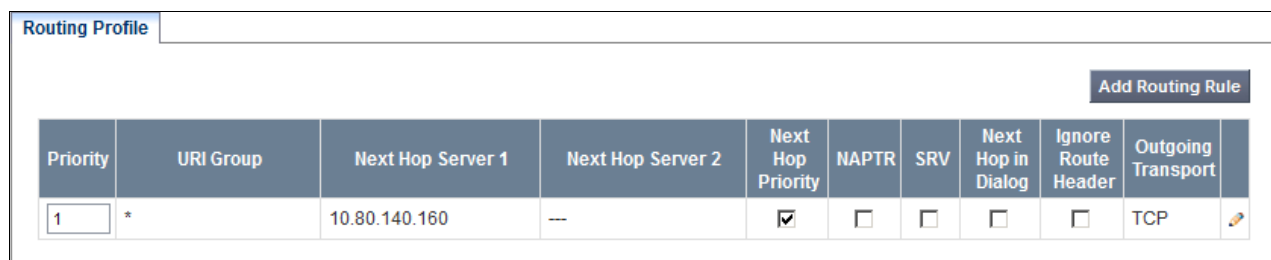

### 7.4.1 Routing Configuration for Session Manager

Click the **Add Profile** button (not shown) to add a new profile, or select an existing routing profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “To\_Avaya” shown below. Click **Next**.

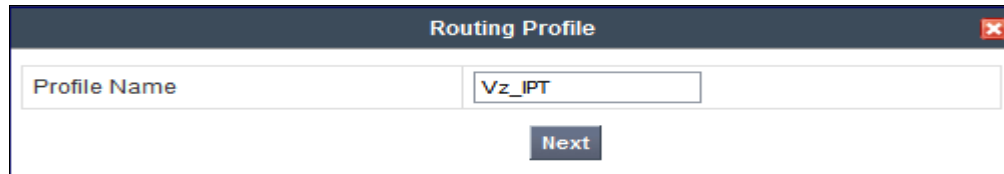

For the **Next Hop Routing**, enter the IP Address of the Session Manager SIP signaling interface as **Next Hop Server 1**, as shown below. Check **Next Hop Priority**. Choose **TCP** for **Outgoing Transport**. Then click **Finish**.

Priority	URI Group	Next Hop Server 1	Next Hop Server 2	Next Hop Priority	NAPTR	SRV	Next Hop in Dialog	Ignore Route Header	Outgoing Transport
1	*	10.80.140.160	---	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	TCP

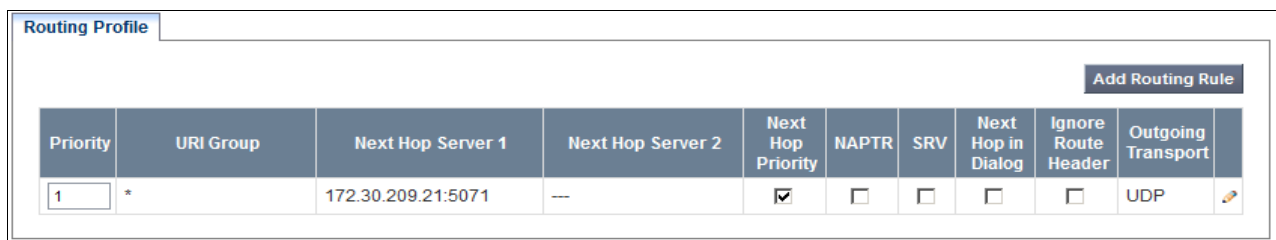

## 7.4.2 Routing Configuration for Verizon IP Trunk

Click the **Add Profile** button (not shown) to add a new profile, or select an existing routing profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “Vz\_IPT” shown below. Click **Next**.

The screenshot shows a window titled "Routing Profile" with a close button in the top right. Inside, there is a text field labeled "Profile Name" containing the text "Vz\_IPT". Below the text field is a button labeled "Next".

For the **Next Hop Routing**, enter the IP Address of the Verizon SIP signaling interface as **Next Hop Server 1**, as shown below. Check **Next Hop Priority**. Choose **UDP** for **Outgoing Transport**, then click **Finish** (not shown).

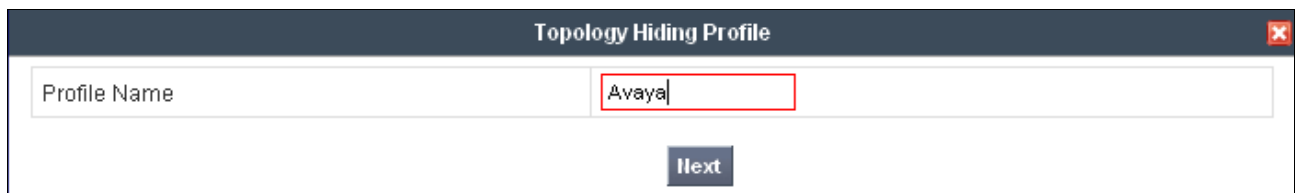

The screenshot shows a window titled "Routing Profile" with a close button in the top right. Below the title bar is a button labeled "Add Routing Rule". Below that is a table with the following columns: Priority, URI Group, Next Hop Server 1, Next Hop Server 2, Next Hop Priority, NAPTR, SRV, Next Hop in Dialog, Ignore Route Header, and Outgoing Transport. The table contains one row with the following values: Priority: 1, URI Group: \*, Next Hop Server 1: 172.30.209.21:5071, Next Hop Server 2: ---, Next Hop Priority: ☒, NAPTR: ☐, SRV: ☐, Next Hop in Dialog: ☐, Ignore Route Header: ☐, and Outgoing Transport: UDP. There is a small edit icon at the end of the Outgoing Transport cell.

Priority	URI Group	Next Hop Server 1	Next Hop Server 2	Next Hop Priority	NAPTR	SRV	Next Hop in Dialog	Ignore Route Header	Outgoing Transport
1	*	172.30.209.21:5071	---	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	UDP

## 7.4.3 Topology Hiding for Session Manager

The Topology Hiding profile manages how various source, destination and routing information in SIP and SDP message headers are substituted or changed to maintain the integrity of the network. It hides the topology of the enterprise network from external networks.

Click the **Add Profile** button (not shown) to add a new profile, or select an existing topology hiding profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “Avaya” shown below. Click **Next**.

The screenshot shows a window titled "Topology Hiding Profile" with a close button in the top right. Inside, there is a text field labeled "Profile Name" containing the text "Avaya". Below the text field is a button labeled "Next".

In the resultant screen, click the **Add Header** button in the upper right multiple times to reveal additional headers.

The screenshot shows a window titled "Topology Hiding Profile" with a close button in the top right. Below the title bar is a button labeled "Add Header". Below that is a table with the following columns: Header, Criteria, Replace Action, and Overwrite Value. The table contains one row with the following values: Header: Request-Line, Criteria: IP/Domain, Replace Action: Auto, and Overwrite Value: (empty). There is a small red 'X' icon at the end of the Overwrite Value cell.

Header	Criteria	Replace Action	Overwrite Value
Request-Line	IP/Domain	Auto	

In the Replace Action column an action of “Auto” will replace the header field with the IP address of the Sipera interface and the Overwrite will use the value in the “Overwrite Value”. In the example shown, this profile will later be applied in the direction of the Session Manager and “Overwrite” has been selected for the To/From and Request-Line headers and the shared interop lab domain of “avayalab.com” has been inserted. This action can also be done in the Session Manager in the Adaptations section. Click **Finish**.

Edit Topology Hiding Profile ✕

Header	Criteria	Replace Action	Overwrite Value	
To	IP/Domain	Overwrite	avayalab.com	✕
Via	IP/Domain	Auto		✕
From	IP/Domain	Overwrite	avayalab.com	✕
Request-Line	IP/Domain	Overwrite	avayalab.com	✕
SDP	IP/Domain	Auto		✕
Record-Route	IP/Domain	Auto		✕

Finish

After configuration is completed, the Topology Hiding for profile “Avaya” will appear as follows.

Topology Hiding			
Header	Criteria	Replace Action	Overwrite Value
To	IP/Domain	Overwrite	avayalab.com
Via	IP/Domain	Auto	---
From	IP/Domain	Overwrite	avayalab.com
Request-Line	IP/Domain	Overwrite	avayalab.com
SDP	IP/Domain	Auto	---
Record-Route	IP/Domain	Auto	---

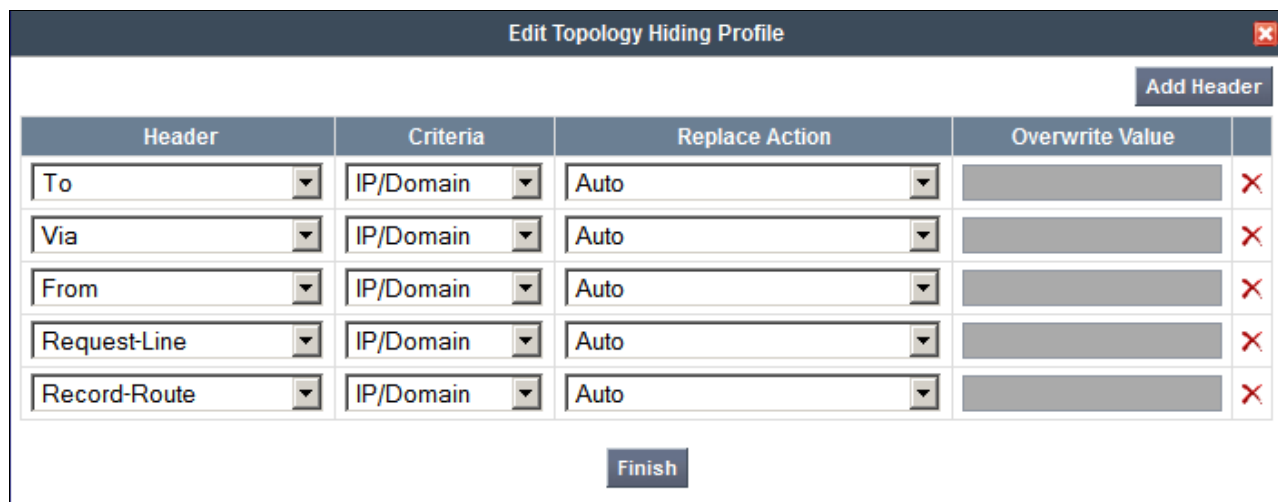

## 7.4.4 Topology Hiding for Verizon IP Trunk

Click the **Add Profile** button (not shown) to add a new profile, or select an existing topology hiding profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “Verizon\_IPT” shown below. Click **Next**.

The screenshot shows a window titled "Topology Hiding Profile". Inside, there is a text input field labeled "Profile Name" containing the text "Verizon\_IPT". Below the input field is a button labeled "Next".

Again, in the resultant screen, click the **Add Header** button in the upper right multiple times to reveal additional headers. The default “Auto” behaviors are sufficient. Click **Finish**.

The screenshot shows a window titled "Edit Topology Hiding Profile". In the top right corner is an "Add Header" button. Below it is a table with the following structure:

Header	Criteria	Replace Action	Overwrite Value	
To	IP/Domain	Auto		X
Via	IP/Domain	Auto		X
From	IP/Domain	Auto		X
Request-Line	IP/Domain	Auto		X
Record-Route	IP/Domain	Auto		X

At the bottom center of the window is a "Finish" button.

After configuration is completed, the **Topology Hiding** for profile “Verizon\_IPT” will appear as follows.

Topology Hiding			
Header	Criteria	Replace Action	Overwrite Value
To	IP/Domain	Auto	---
Via	IP/Domain	Auto	---
From	IP/Domain	Auto	---
Request-Line	IP/Domain	Auto	---
Record-Route	IP/Domain	Auto	---

## 7.4.5 Signaling Manipulation

This feature adds the ability to add, change and delete any of the headers and other information in a SIP message on each flow in a highly flexible manner using a proprietary scripting language.

Click the **Add Script** button (not shown) to add a new script, or select an existing script to edit. If adding a script, a screen such as the following is displayed. Enter a title in the upper left and then enter the text to manipulate headers and click **Save**.

Untitled - SigMa Editor - Mozilla Firefox

In Communication Manager and Session Manager 6.2, there are two proprietary headers (P-Location and Endpoint-View) and one standard header (Alert-Info) that contain internal information and that are not applicable to a service provider that need to be stripped. These headers were stripped with a Sigma script and applied in the server configuration section. The script “Example2” is shown here. This script will be applied in the next section, ‘Server Configuration’.

#### Signaling Manipulation

```
within session "ALL"
{
  act on message where $DIRECTION="OUTBOUND" and $ENTRY_POINT="POST_ROUTING"
  {
    // Topology Hiding of P-Location header for subsequent re-INVITES

    remove($HEADERS["P-Location"][1]);
    remove($HEADERS["Endpoint-View"][1]);
    remove($HEADERS["Alert-Info"][1]);
    remove($HEADERS["x-nt-e164-clid"][1]);
    remove($HEADERS["History-info"][1]);
    remove($HEADERS["User-Agent"][1]);
    remove($HEADERS["Server"][1]);

    $HEADERS["Supported"][1].regex_replace("x-nortel-sipvc, ","");

  }
}
```

[Edit](#)

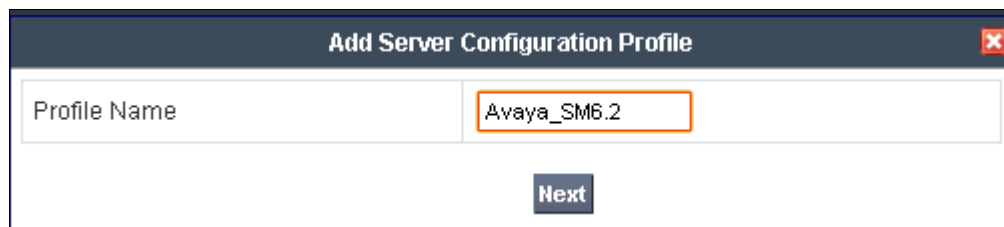

## 7.5. Global Profiles – Server Configuration

Select **Global Profiles** → **Server Configuration** from the left-side menu as shown below.

### 7.5.1 Server Configuration for Session Manager

Click the **Add Profile** button (not shown) to add a new profile, or select an existing profile to edit. If adding a profile, a screen such as the following is displayed. Enter an appropriate Profile Name such as “Avaya\_SM6.2” shown below. Click **Next**.

A screenshot of the 'Add Server Configuration Profile' dialog box. The dialog has a title bar with the text 'Add Server Configuration Profile' and a close button. Inside the dialog, there is a text input field labeled 'Profile Name' which contains the text 'Avaya\_SM6.2'. Below the input field is a button labeled 'Next'.

The following screens illustrate the Server Configuration for the Profile name “Avaya\_SM6.2”. On the “General” tab, select “Call Server” from the **Server Type** drop-down menu. In the **IP Addresses / Supported FQDNs** area, the IP Address of the Session Manager SIP signaling interface in the sample configuration is entered. This IP Address is 10.80.140.160. In the **Supported Transports** area, TCP is selected, and the **TCP Port** is set to 5060. This configuration corresponds with the Session Manager entity link configuration for the entity link to the ASBCE created in Section 6.4. If adding a new profile, click **Next** (not shown). If editing an existing profile, click **Finish** (not shown).

Server Type	Call Server 
IP Addresses / Supported FQDNs Comma seperated list	10.80.140.160
Supported Transports	<input checked="" type="checkbox"/> TCP <input type="checkbox"/> UDP <input type="checkbox"/> TLS
TCP Port	5060
UDP Port	5060
TLS Port	

Once configuration is completed, the **General** tab for “Avaya\_SM6.2” will appear as shown below.

		Rename Profile	Clone Profile	Delete Profile
<div> <div>General</div> <div>Authentication</div> <div>Heartbeat</div> <div>Advanced</div> </div>				
General				
Server Type	Call Server			
IP Addresses / FQDNs	10.80.140.160			
Supported Transports	TCP			
TCP Port	5060			
<div>Edit</div>				

If adding the profile, click **Next** to accept default parameters for the Authentication tab (not shown), and advance to the Heartbeat area. If editing an existing profile, select the **Heartbeat** tab and click **Edit** (not shown).

The ASBCE can be configured to source “heartbeats” in the form of SIP OPTIONS. In the sample configuration, with one Session Manager, this configuration is optional unless 2- CPE is used. If 2-CPE is used, the OPTIONS must be configured along with the **TCP Probe Frequency** at 10 seconds.

If ASBCE-sourced OPTIONS messages are desired, check the **Enable Heartbeat** box. Select “OPTIONS” from the **Method** drop-down menu. Select the desired frequency that the ASBCE will source OPTIONS to this server. The **From URI** and **To URI** may be filled in to configure easily identifiable URIs to appear in SIP OPTIONS sourced by the ASBCE towards Session Manager. If adding a new profile, click **Next** (not shown). If editing an existing profile, click **Finish** (not shown).

General		Authentication		Heartbeat		Advanced	
						Heartbeat	
Enable Heartbeat						<input checked="" type="checkbox"/>	
Method						OPTIONS	
Frequency						60 seconds	
From URI						ping@10.80.140.141	
To URI						ping@10.80.140.160	
TCP Probe						<input checked="" type="checkbox"/>	
TCP Probe Frequency						10 seconds	

If adding a profile, click **Next** to continue to the “Advanced” settings (not shown). If editing an existing profile, select the **Advanced** tab and **Edit** (not shown). In the resultant screen, select the **Interworking Profile** “Avaya” created previously. Click **Finish**.

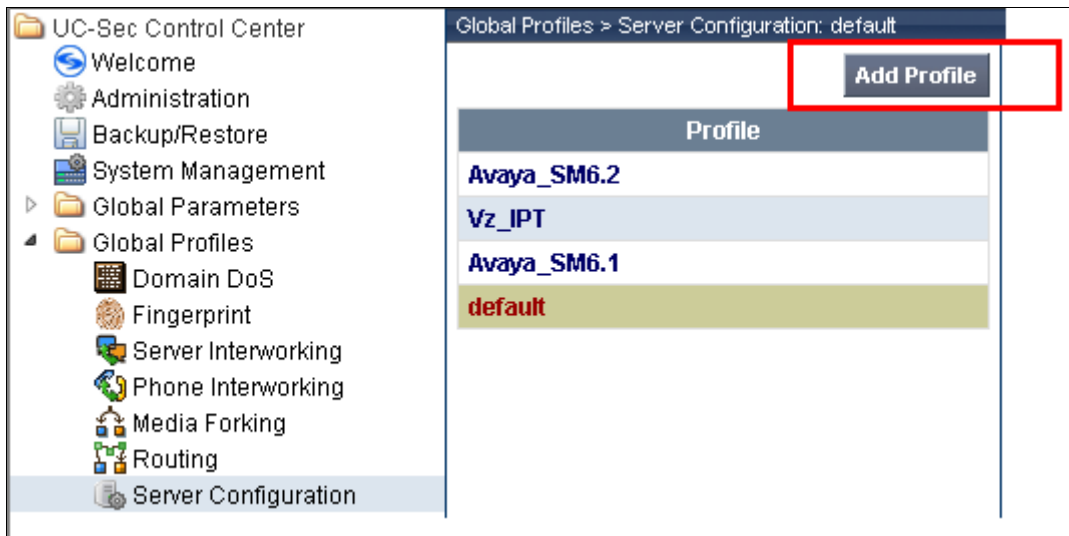

Edit Server Configuration Profile - Advanced	
Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	Avaya
Signaling Manipulation Script	None
TCP Connection Type	<input checked="" type="radio"/> SUBID <input type="radio"/> PORTID <input type="radio"/> MAPPING
<input type="button" value="Finish"/>	

Once configuration is completed, the **Advanced** tab for the profile “Avaya\_SM6.2” will appear as shown below.

Advanced	
Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	Avaya
Signaling Manipulation Script	None
TCP Connection Type	SUBID

## 7.5.2 Server Configuration for Verizon IP Trunk

Click the **Add Profile** button to add a new profile, or select an existing profile to edit.

If adding a profile, a screen such as the following is displayed. Enter an appropriate Profile Name such as “Vz\_IPT” shown below. Click **Next**.

The screenshot shows a dialog box titled 'Add Server Configuration Profile'. It has a 'Profile Name' label and a text input field containing 'Vz\_IPT'. The input field is highlighted with a red rectangle. Below the input field is a 'Next' button.

The following screens illustrate the Server Configuration with Profile name “Vz\_IPT”. In the “General” parameters, select “Trunk Server” from the **Server Type** drop-down menu. In the **IP Addresses / Supported FQDNs** area, the Verizon-provided IP Trunk IP Address is entered. This IP Address is 172.30.209.21. In the **Supported Transports** area, UDP is selected, and the **UDP Port** is set to 5071. Click **Next** to proceed to the **Authentication** Tab.

Add Server Configuration Profile - General	
Server Type	Trunk Server
IP Addresses / Supported FQDNs Comma seperated list	172.30.209.21
Supported Transports	<input type="checkbox"/> TCP <input checked="" type="checkbox"/> UDP <input type="checkbox"/> TLS
TCP Port	
UDP Port	5071
TLS Port	
<div>Back Next</div>	

If adding the profile, click **Next** to accept default parameters for the **Authentication** tab (below), and advance to the Heartbeat area. No authentication was used in the test configuration.

Add Server Configuration Profile - Authentication	
Enable Authentication	<input type="checkbox"/>
User Name	
Realm	
Password	
Confirm Password	
<div>Back Next</div>	

The ASBCE can be configured to source “heartbeats” in the form of SIP OPTIONS towards Verizon. This configuration is optional. Independent of whether the ASBCE is configured to source SIP OPTIONS towards Verizon, Verizon will receive OPTIONS from the enterprise site as a result of the SIP Entity Monitoring configured for Session Manager. When Session Manager

sends SIP OPTIONS to the inside private IP Address of the ASBCE, the ASBCE will send SIP OPTIONS to Verizon. When Verizon responds, the ASBCE will pass the response to Session Manager.

If ASBCE-sourced OPTIONS are desired, select “OPTIONS” from the **Method** drop-down menu. Select the desired frequency that the SBCE will source OPTIONS. The **From URI** and **To URI** may be filled in to configure easily identifiable URIs to appear in SIP OPTIONS sourced by the ASBCE. If adding a new profile, click **Next** to continuing to the “Advanced” settings. If editing an existing profile, click **Finish** (not shown).

Add Server Configuration Profile - Heartbeat	
Enable Heartbeat	<input checked="" type="checkbox"/>
Method	OPTIONS
Frequency	60 seconds
From URI	ping@2.2.2.2
To URI	ping@172.30.209.21
TCP Probe	<input type="checkbox"/>
TCP Probe Frequency	seconds
<div>Back</div> <div>Next</div>	

If the optional ASBCE sourced OPTIONS configuration is completed, the **Heartbeat** tab for “Vz\_IPT” will appear as shown below.

General	Authentication	Heartbeat	Advanced
Heartbeat			
Enable Heartbeat		<input checked="" type="checkbox"/>	
Method		OPTIONS	
Frequency		60 seconds	
From URI		ping@2.2.2.2	
To URI		ping@172.30.209.21	
TCP Probe		<input type="checkbox"/>	

If editing an existing profile, highlight the desired profile and select the **Advanced** tab and then click the **Edit button** (not shown). In the resultant screen, select the **Interworking Profile** “Verizon” created previously, and Signaling Manipulation Script will be the script shown in the previous section titled “Example2”. Other ASBCE features, such as DoS Protection and Grooming, can be configured according to customer preference. Click **Finish**.

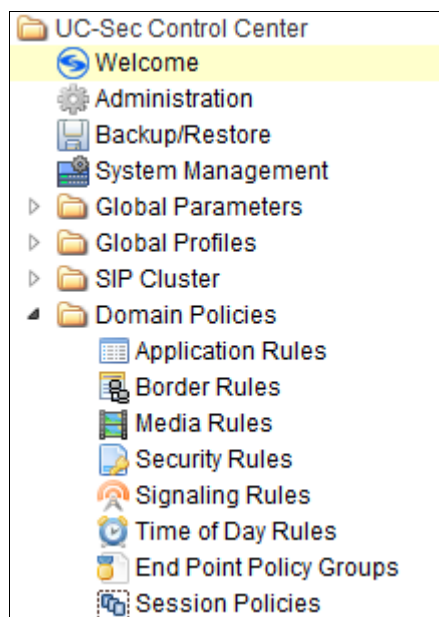

Edit Server Configuration Profile - Advanced	
Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	Verizon
Signaling Manipulation Script	Example2
UDP Connection Type	<input checked="" type="radio"/> SUBID <input type="radio"/> PORTID <input type="radio"/> MAPPING
<input type="button" value="Finish"/>	

Once configuration is completed, the **Advanced** tab for “Vz\_-IPT” will appear as shown below.

General	Authentication	Heartbeat	Advanced
Advanced			
Enable DoS Protection			<input type="checkbox"/>
Enable Grooming			<input type="checkbox"/>
Interworking Profile			Verizon
Signaling Manipulation Script			Example2
UDP Connection Type			SUBID

## 7.6. Domain Policies – Application Rule

Select **Domain Policies** → **Application Rules** from the left-side menu as shown below.

In the sample configuration, a single application rule was created by cloning the default rule called “default”. Select the default rule and click the **Clone Rule** button.

Enter a name in the **Clone Name** field, such as “Vz\_App\_Rule” as shown below. Click **Finish**.

Select the newly created rule and click the **Edit** button (not shown). In the resulting screen, change the default **Maximum Concurrent Sessions** to 2000, the **Maximum Session per Endpoint** to 2000. Click **Finish**.

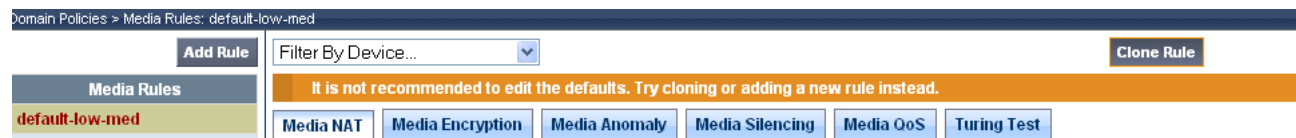

Application Type	In	Out	Maximum Concurrent Sessions	Maximum Sessions Per Endpoint
Voice	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	2000	2000
Video	<input type="checkbox"/>	<input type="checkbox"/>		
IM	<input type="checkbox"/>	<input type="checkbox"/>		

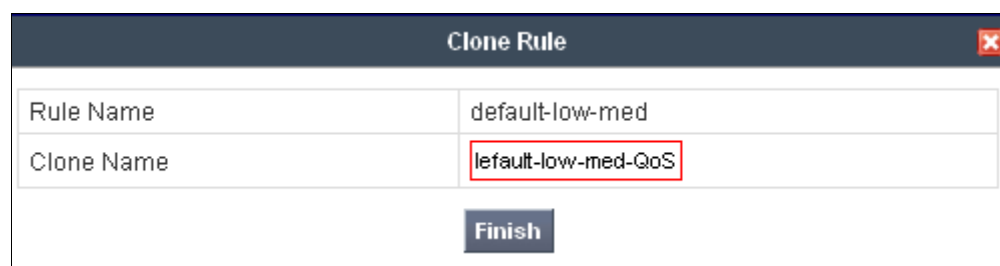

Miscellaneous			
CDR Support	None		
IM Logging	No		
RTCP Keep-Alive	No		

## 7.7. Domain Policy – Media Rules

In the sample configuration, a single media rule was created by cloning the default rule called “default-low-med”. Select the default-low-med rule and click the **Clone Rule** button.

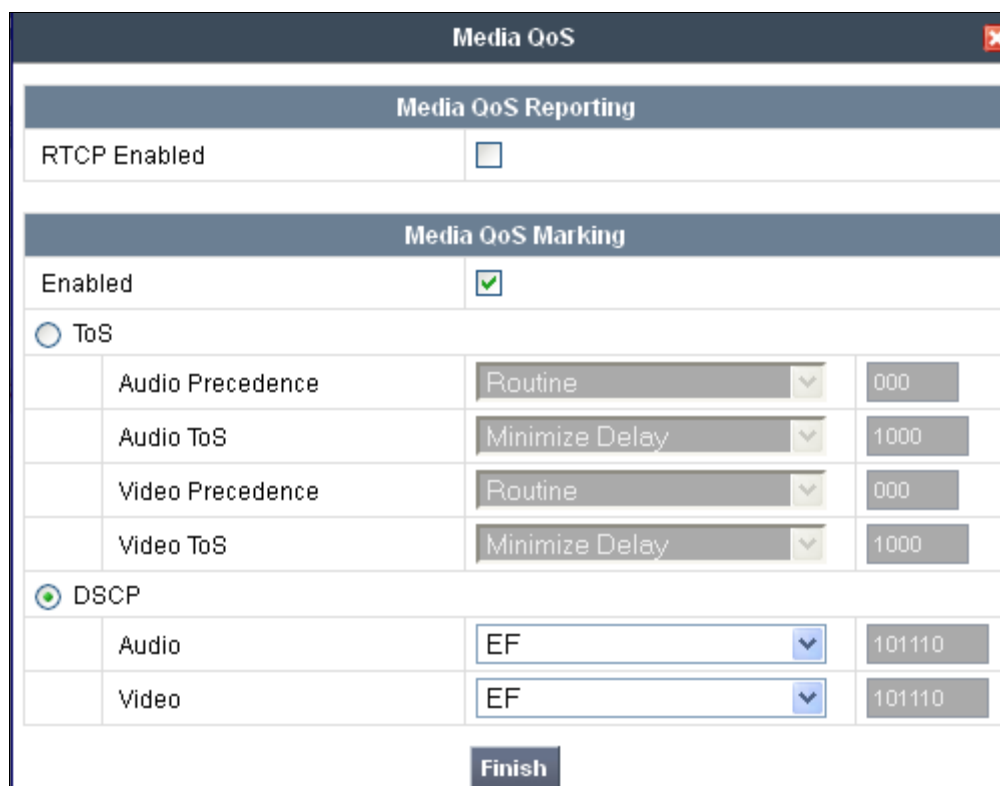

Enter a name in the **Clone Name** field, such as “default-low-med-QoS” as shown below. Click **Finish**.

Clone Rule	
Rule Name	default-low-med
Clone Name	default-low-med-QoS
<b>Finish</b>	

Select the newly created rule, select the **Media QoS** tab (shown in previous screen), and click the **Edit** button (not shown). In the resulting screen below, check the **Media QoS Marking Enabled** checkbox. Select **DSCP** and select “EF” for expedited forwarding as shown below. Click **Finish**.

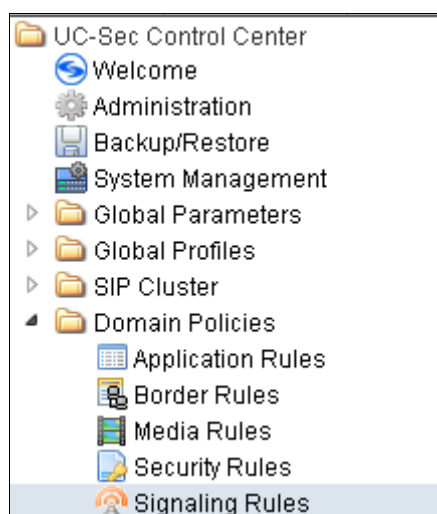

Media QoS			
<b>Media QoS Reporting</b>			
RTCP Enabled		<input type="checkbox"/>	
<b>Media QoS Marking</b>			
Enabled		<input checked="" type="checkbox"/>	
<input type="radio"/> ToS			
Audio Precedence	Routine		000
Audio ToS	Minimize Delay		1000
Video Precedence	Routine		000
Video ToS	Minimize Delay		1000
<input checked="" type="radio"/> DSCP			
Audio	EF		101110
Video	EF		101110
<b>Finish</b>			

When configuration is complete, the “default-low-med-QoS” media rule **Media QoS** tab appears as follows.

The screenshot shows the 'Media Rules' configuration page for the 'default-low-med-QoS' rule. The left sidebar lists several media rules, with 'default-low-med-QoS' highlighted. The main panel has tabs for 'Media NAT', 'Media Encryption', 'Media Anomaly', 'Media Silencing', 'Media QoS', and 'Turing Test'. The 'Media QoS' tab is active, showing sections for 'Media QoS Reporting' (with 'RTCP Enabled' unchecked), 'Media QoS Marking' (with 'Enabled' checked and 'QoS Type' set to 'DSCP'), 'Audio QoS' (with 'Audio DSCP' set to 'EF'), and 'Video QoS' (with 'Video DSCP' set to 'EF').

## 7.8. Domain Policies – Signaling Rules

Select **Domain Policies** → **Signaling Rules** from the left-side menu as shown below.

Click the **Add Rule** button (not shown) to add a new signaling rule. In the Rule Name field, enter an appropriate name, such as “Block\_Hdr\_Remark” and click **Next**.

The screenshot shows a 'Signaling Rule' configuration dialog box. It has a title bar with a close button. Inside, there is a 'Rule Name' label and a text input field containing 'Block\_Hdr\_Remark'. Below the input field is a 'Next' button.

In the subsequent screen (not shown), click **Next** to accept defaults. In the Signaling QoS screen below, select **DSCP** and select the desired **Value** for Signaling QoS from the drop-down box. In the sample configuration, “AF32” was selected for Assured Forwarding 32. Click **Finish** (not shown).

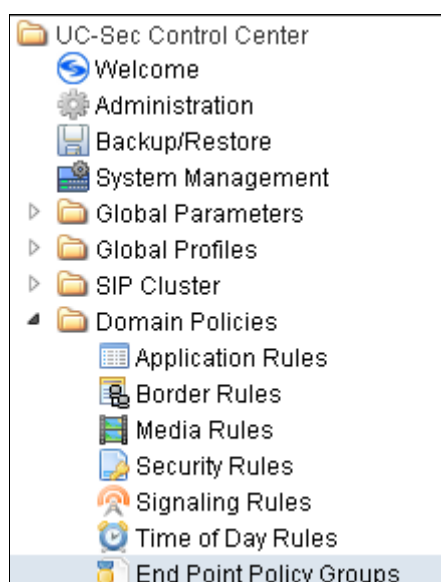

Signaling QoS			
Enabled		<input checked="" type="checkbox"/>	
<input type="radio"/> ToS			
	Precedence	Routine	000
	ToS	Minimize Delay	1000
<input checked="" type="radio"/> DSCP			
	Value	AF32	011100

After this configuration, the new “Block\_Hdr\_Remark” will appear as follows.

Domain Policies > Signaling Rules: Block_Hdr_Remark	
<b>Add Rule</b> Signaling Rules default No-Content-Type-Checks HideP-Loc signal-QoS <b>Block_Hdr_Remark</b>	Filter By Device... Click here to add a description. Rename Rule Clone Rule Delete Rule General Requests Responses Request Headers Response Headers Signaling QoS Signaling QoS <input checked="" type="checkbox"/> QoS Type DSCP DSCP AF32

## 7.9. Domain Policies – End Point Policy Groups

Select **Domain Policies** → **End Point Policy Groups** from the left-side menu as shown below.

Select the **Add Group** button.

Domain Policies > End Point Policy Groups: default-low

**Add Group** Filter By Device...

**Policy Groups** It is not recommended to edit the defaults. Try adding a new group instead.

Enter a name in the **Group Name** field, such as “default-low-remark” as shown below. Click **Next**.

**Policy Group**

Group Name default-low-remark

**Next**

In the sample configuration, defaults were selected for all fields, with the exception of the **Application Rule** which was set to “Vz\_App\_Rule”, **Media Rule** which was set to “default-low-med-QoS”, and the **Signaling Rule**, which was set to “Block\_Hdr\_Remark” as shown below. The selected non-default media rule and signaling rule chosen were created in previous sections. Click **Finish**.

**Edit Policy Set**

**Application Rule** Vz\_App\_Rule

**Border Rule** default

**Media Rule** def-low-media-QOS

**Security Rule** default-low

**Signaling Rule** Block\_Hdr\_Remark

**Time of Day Rule** default

**Finish**

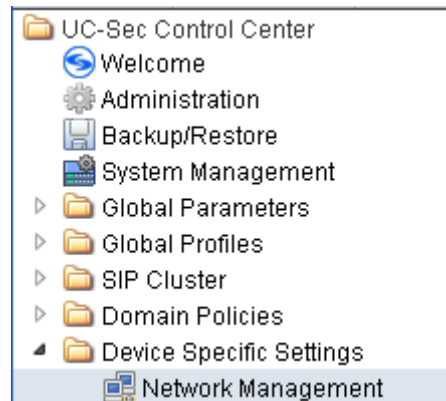

Once configuration is completed, the “default-low-remark” policy group will appear as follows.

Policy Group							
					<b>View Summary</b>	<b>Add Policy Set</b>	
Order	Application	Border	Media	Security	Signaling	Time of Day	
1	Vz_App_Rule	default	def-low-media-QOS	default-low	Block_Hdr_Remark	default	

## 7.10. Device Specific Settings - Network Management

Select **Device Specific Setting** → **Network Management** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “VZ\_1” in the sample configuration (not shown). The **Network Configuration** tab is shown below. Observe the **IP Address**, **Netmask (A1 and B1)**, **Gateway**, and **Interface** information previously assigned.

**Network Configuration** | **Interface Configuration**

Modifications or deletions of an IP address or its associated data require an application restart before taking effect. Application restarts can be issued from [System Management](#).

A1 Netmask: 255.255.255.0    A2 Netmask:    B1 Netmask: 255.255.255.0    B2 Netmask:   

**Add IP**    **Save Changes**    **Clear Changes**

IP Address	Public IP	Gateway	Interface	
10.80.140.141		10.80.140.1	A1	✗
2.2.2.2		2.2.2.1	B1	✗

Select the **Interface Configuration** tab. The Administrative Status can be toggled between “Enabled” and “Disabled” in this screen. The following screen was captured after the interfaces had already been enabled. To enable the interface if it is disabled, click the **Toggle State** button.

**Network Configuration** | **Interface Configuration**

Name	Administrative Status	
A1	Enabled	<b>Toggle State</b>
A2	Disabled	<b>Toggle State</b>
B1	Enabled	<b>Toggle State</b>
B2	Disabled	<b>Toggle State</b>

## 7.11. Device Specific Settings – Media Interface

Select **Device Specific Setting** → **Media Interface** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “VZ\_1” in the sample configuration (not shown). Click **Add Media Interface**.

**Media Interface**

Modifying or deleting an existing media interface will require an application restart before taking effect. Application restarts can be issued from [System Management](#).

Add Media Interface

Enter an appropriate **Name** for the media interface for the Avaya CPE and select the inside private IP Address from the **IP Address** drop-down menu. In the sample configuration, “Int\_Media\_to\_CPE” is chosen as the Name, and the “inside” IP Address of the ASBCE is “10.80.140.141”. For the **Port Range**, default values are shown. Click **Finish**.

**Add Media Interface**

Name	Int_Media_to_CPE
IP Address	10.80.140.141
Port Range	35000 - 40000

Finish

Once again, select **Add Media Interface**. Enter an appropriate **Name** for the media interface for the public “outside” of the ASBCE, and select the outside public IP Address from the **IP Address** drop-down menu. In the sample configuration, “Ext\_Media\_to\_VZ” is chosen as the name, and the “outside” public IP Address of the ASBCE is “2.2.2.2”. For the **Port Range**, default values are shown. Verizon IP Trunk does not require that the RTP ports be chosen within a specific range. Click **Finish**.

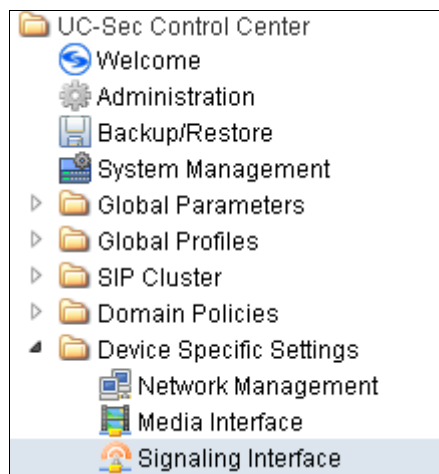

Edit Media Interface	
Name	Ext_Media_to_Vz
IP Address	2.2.2.2
Port Range	35000 - 40000
<input type="button" value="Finish"/>	

The resultant Media Interface configuration used in the sample configuration is shown below.

Media Interface			
Modifying or deleting an existing media interface will require an application restart before taking effect. Application restarts can be issued from <a href="#">System Management</a> .			
			<input type="button" value="Add Media Interface"/>
Name	Media IP	Port Range	
Int_Media_to_CPE	10.80.140.141	35000 - 40000	
Ext_Media_to_Vz	2.2.2.2	35000 - 40000	

## 7.12. Device Specific Settings – Signaling Interface

Select **Device Specific Setting** → **Signaling Interface** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “VZ\_1” in the sample configuration (not shown). Select **Add Signaling Interface**.

UC-Sec Devices	Signaling Interface
VZ_1	<div>Add Signaling Interface</div>

In the **Edit Signaling Interface** screen, enter an appropriate **Name** (e.g., “Sig\_Inside\_to\_CPE”) for the “inside” private interface, and choose the private inside IP Address (e.g., 10.80.140.141) from the **IP Address** drop-down menu. Choose **TCP Port** “5060” since TCP and port 5060 is used between Session Manager and the ASBCE in the sample configuration. Click **Finish**.

Edit Signaling Interface

Only Cluster TLS is available because no TLS Server Profiles exist. There is no restriction on non-TLS profiles.

Name	Sig_Inside_to_CPE
IP Address	10.80.140.141
TCP Port Leave blank to disable	5060
UDP Port Leave blank to disable	5060
TLS Port Leave blank to disable	
Cluster TLS Only for use with Cisco SIP Clusters	<input type="checkbox"/>
Enable Stun Requires a UDP Port	<input type="checkbox"/>

Finish

Once again, select **Add Signaling Interface**. In the Add Signaling Interface screen, enter an appropriate **Name** (e.g., “Sig\_Outside\_to\_VZ”) for the “outside” public interface, and choose the public IP Address (e.g., “2.2.2.2”) from the **IP Address** drop-down box. Choose **UDP Port** “5060”. In the sample configuration, Verizon will send SIP signaling using UDP to the CPE IP Address 2.2.2.2 and to UDP Port 5060. Click **Finish**.

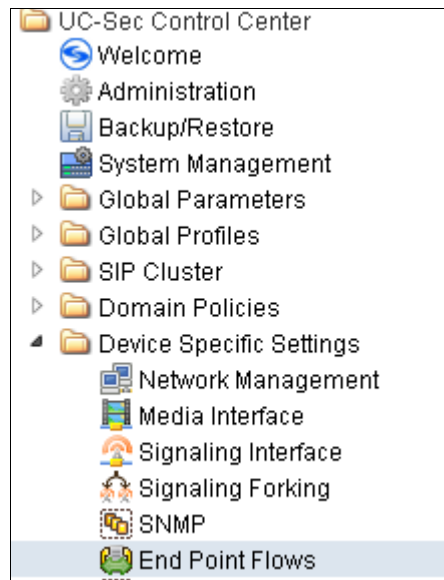

Edit Signaling Interface	
Only Cluster TLS is available because no TLS Server Profiles exist. There is no restriction on non-TLS profiles.	
Name	Sig_Outside_to_Vz
IP Address	2.2.2.2
TCP Port Leave blank to disable	
UDP Port Leave blank to disable	5060
TLS Port Leave blank to disable	
Cluster TLS Only for use with Cisco SIP Clusters	<input type="checkbox"/>
Enable Stun Requires a UDP Port	<input type="checkbox"/>
Finish	

The following screen shows the signaling interfaces defined for the sample configuration.

Signaling Interface						
						Add Signaling Interface
Name	Signaling IP	TCP Port	UDP Port	TLS Port	TLS Profile	
Sig_Inside_to_CPE	10.80.140.141	5060	5060	---	None	
Sig_Outside_to_Vz	2.2.2.2	---	5060	---	None	

## 7.13. Device Specific Settings – End Point Flows

Select **Device Specific Setting** → **End Point Flows** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “VZ\_1” in the sample configuration (not shown). Select the **Server Flows** tab. Select **Add Flow**.

The following screen shows the flow named “Avaya\_SM” being added to the sample configuration. This flow uses the interfaces, policies, and profiles defined in previous sections. Click **Finish**.

Criteria	
Flow Name	Avaya_SM
Server Configuration	Avaya_SM

## 8. Verizon Business IP Trunk Services Suite Configuration

Information regarding Verizon Business IP Trunk Services suite offer can be found at <http://www.verizonbusiness.com/Products/communications/ip-telephony/> or by contacting a Verizon Business sales representative.

The reference configuration described in these Application Notes is located in the Avaya Solutions and Interoperability Test Lab. Access to the Verizon Business IP Trunk Services suite was via a Verizon Private IP (PIP) T1 connection. Verizon Business provided all of the necessary service provisioning.

### 8.1. Service Access Information

The following service access information (FQDN, IP addressing, ports, IP toll free numbers) was provided by Verizon for the sample configuration.

CPE (Avaya)	Verizon Network
<i>adevc.avaya.globalipcom.com</i> <i>UDP port 5060</i>	<i>172.30.209.21</i> <i>UDP Port 5071</i>

IP DID Numbers
732-945-0240
732-945-0241
732-945-0242
732-945-0243
732-945-0244
732-945-0285
732-945-0286
732-945-0287
732-945-0288

## 9. Verification Steps

This section provides example verifications of the Avaya configuration with Verizon Business Private IP (PIP) Trunk service.

### 9.1. Illustration of OPTIONS Handling

This section illustrates SIP OPTIONS monitoring of the SIP trunk from Verizon to the CPE and from the CPE to Verizon through the ASBCE.

The following screens from a filtered Wireshark trace illustrate OPTIONS sent by Verizon to the CPE. Verizon IP Trunk service uses OPTIONS to determine whether the CPE is available to receive inbound calls. Therefore, proper OPTIONS response is necessary. In the trace shown below, taken from the outside public side of the ASBCE, frame 7 is highlighted and expanded to show OPTIONS sent from Verizon IPC Trunk (172.30.209.21) to the ASBCE (2.2.2.2). Observe the use of UDP for transport, from source port 5071 (Verizon) to destination port 5060 (Avaya). Verizon sends the Avaya domain “2.2.2.2” in the Request-Line. Note that Max-Forwards is 70.

Filter:	sip	Expression...	Clear	Apply
No.	Source	Destination	Protocol	Info
7	172.30.209.21	2.2.2.2	SIP	Request: OPTIONS sip:2.2.2.2:5060

⊞ Route: <sip:2.2.2.2:5060;lr>				

Before the ASBCE replies to Verizon, the ASBCE sends OPTIONS to Session Manager on the inside private interface. In the trace shown below, taken from the private side of the ASBCE, frame 34 is highlighted and expanded to show OPTIONS sent from the inside interface of the ASBCE (10.80.140.141) to Session Manager (10.80.140.160). Observe the use of TCP for transport, using port 5060. Observe that the ASBCE has changed the Request-URI, From and To headers per the previous configuration such that “avayalab.com” now appears. Note that Max-Forwards has been decremented by 1 and is now 69.

## 9.2. Avaya Aura® Communication Manager Verifications

This section illustrates verifications from Communication Manager.

### 9.2.1 Example Incoming Call from PSTN via Verizon SIP Trunk

Incoming PSTN calls arrive from Verizon at ASBCE, which sends the call to Session Manager. In the sample configuration, when the ASBCE is in-service, Verizon sends all inbound calls to ASBCE-1 (i.e., not load balanced). Session Manager sends the call to Communication Manager via the entity link corresponding to the Avaya HP Common Server using port 5062. On Communication Manager, the incoming call arrives via signaling group 68 and trunk group 68.

The following edited Communication Manager *list trace tac* trace output shows a call incoming on trunk group 68. The PSTN telephone dialed 732-945-0286. Session Manager can map the number received from Verizon to the extension of a Communication Manager telephone (x2011), or the incoming call handling table for trunk group 68 can do the same. In the trace below, Communication Manager had already mapped the Verizon DID to Communication Manager extension. Extension 2011 is an IP Telephone with IP address 10.80.140.133 in Region 1. Initially, the G450 Media Gateway (10.80.140.148) is used, but as can be seen in the final trace output, once the call is answered, the final RTP media path is “ip-direct” from the IP Telephone (10.80.140.133) to the “inside” of the ASBCE (10.80.140.141).

### 9.2.2 Example Outgoing Calls to PSTN via Verizon IP Trunk

Depending on Session Manager configuration of the “rank” for the routing policies, outbound calls can either use ASBCE-1 preferentially or distribute calls across ASBCE-1 and ASBCE-2. At the time of the following trace, Session Manager was configured such that both ASBCE-1 and ASBCE-2 had the same “rank” and for this particular call, ASBCE-1 was used. Outbound calls using ASBCE-2 look similar and will not be repeated here.

The following edited trace shows an outbound ARS call from IP Telephone x2011 to the PSTN number 9-1-303-538-7023. The call is routed to route pattern 68 and trunk group 68. The call initially uses the gateway (10.80.140.148), but after the call is answered, the call is “shuffled” to become an “ip-direct” connection between the IP Telephone (10.80.140.133) and the “inside” of the ASBCE-1 (10.80.140.141).

## 9.3. Avaya Aura® System Manager and Avaya Aura® Session Manager Verifications

This section contains verification steps that may be performed using System Manager for Session Manager.

### 9.3.1 Verify SIP Entity Link Status

Log in to System Manager. Expand **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring**, as shown below.

▼ <b>Session Manager</b>
<b>Dashboard</b>
<b>Session Manager</b>
<b>Administration</b>
<b>Communication Profile</b>
<b>Editor</b>
▶ <b>Network Configuration</b>
▶ <b>Device and Location</b>
<b>Configuration</b>
▶ <b>Application Configuration</b>
▼ <b>System Status</b>
<b>System State</b>
<b>Administration</b>
<b>SIP Entity Monitoring</b>

## SIP Entity Link Monitoring Status Summary

This page provides a summary of Session Manager SIP entity link monitoring status.

### Entity Link Status for All Session Manager Instances

Run Monitor

1 Item | Refresh

<input type="checkbox"/>	Session Manager Name	Entity Links Down/Total	Entity Links Partially Down	SIP Entities - Monitoring Not Started	SIP Entities - Not Monitored
<input type="checkbox"/>	<a href="#">ASM-62</a>	0/5	0	0	0

Select : All, None

### All Monitored SIP Entities

Run Monitor

5 Items | Refresh | Show ALL Filter: Enable

<input type="checkbox"/>	SIP Entity Name
<input type="checkbox"/>	<a href="#">Avaya-SBCE-1</a>
<input type="checkbox"/>	<a href="#">Avaya-SBCE-2</a>
<input type="checkbox"/>	<a href="#">CM-Evolution-procr-5062</a>
<input type="checkbox"/>	<a href="#">CM-Evolution-procr-5063</a>
<input type="checkbox"/>	<a href="#">CM6.2</a>

Select : All, None

From the list of monitored entities, select an entity of interest, such as “Avaya-SBCE-1”. Under normal operating conditions, the **Link Status** should be “Up” as shown in the example screen below.

## SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

### All Entity Links to SIP Entity: Avaya-SBCE-1

Summary View

1 Item | Refresh

Filter: Enable

► Show	<a href="#">ASM-62</a>	10.80.140.141	5060	TCP	Up	200 OK	Up

Return to the list of monitored entities, and select another entity of interest, such as “CM-Evolution-procr-5062”. Under normal operating conditions, the **Link Status** should be “Up” as shown in the example screen below. Note the use of port 5062.

## SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

### All Entity Links to SIP Entity: CM-Evolution-procr-5062

Summary View

1 Item | Refresh

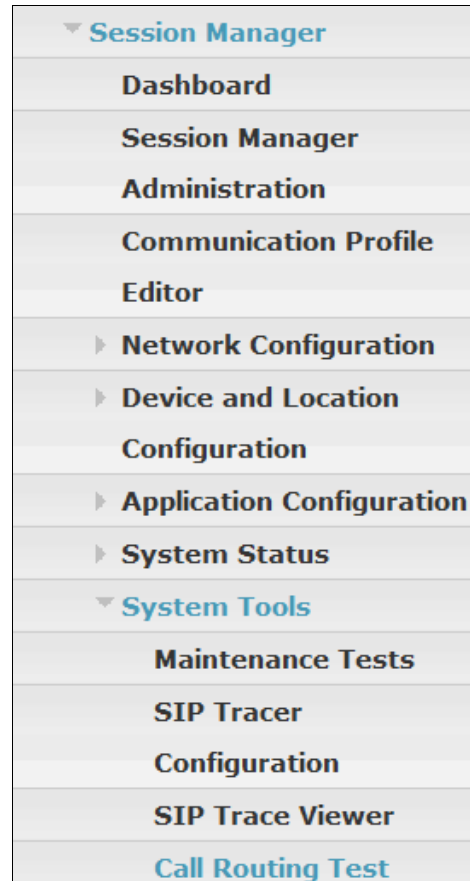

Filter: Enable

Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
► Show	<a href="#">ASM-62</a>	10.80.140.146	5062	TCP	Up	200 OK	Up

### 9.3.2 Call Routing Test

The **Call Routing Test** verifies the routing for a particular source and destination. To run the routing test, expand **Elements** → **Session Manager** → **System Tools** → **Call Routing Test**, as shown below.

A screen such as the following is displayed.

### Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

#### SIP INVITE Parameters

<b>Called Party URI</b> <input type="text"/>	<b>Calling Party Address</b> <input type="text"/>
<b>Calling Party URI</b> <input type="text"/>	<b>Session Manager Listen Port</b> <input type="text" value="5060"/>
<b>Day Of Week</b> <input type="text" value="Wednesday"/>	<b>Transport Protocol</b> <input type="text" value="TCP"/>
<b>Time (UTC)</b> <input type="text" value="16:24"/>	<b>Execute Test</b> <input type="button" value="Execute Test"/>
<b>Called Session Manager Instance</b> <input type="text" value="ASM-62"/>	

Populate the fields for the call parameters of interest. For example, the following screen shows an example call routing test for an outbound call to the PSTN via Verizon. Under **Routing Decisions**, observe that the call will route via an ASBCE on the path to Verizon. Scroll down to inspect the details of the **Routing Decision Process** if desired (not shown).

### Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

#### SIP INVITE Parameters

**Called Party URI**  
3035387022@avayalab.com

**Calling Party URI**  
anycaller@anydomain.com

**Day Of Week**  
Wednesday

**Called Session Manager Instance**

✓	UC-Sec Link Check: B1		eth1 is operating within normal parameters with a - duplex connection at 10Mb/s.	
✓	Ping: UC-Sec (10.80.140.141) to Gateway (10.80.140.1)		Average ping from 10.80.140.141 to 10.80.140.1 is 1.232ms.	
✗	Ping: UC-Sec (10.80.140.141) to Primary DNS (172.30.209.4)		Error: Unable to reach 172.30.209.4 from 10.80.140.141.	
✓	Ping: UC-Sec (2.2.2.2) to Gateway (2.2.2.1)		Average ping from 2.2.2.2 to 2.2.2.1 is 1.809ms.	
✗	Ping: UC-Sec (2.2.2.2) to Primary DNS (172.30.209.4)		Error: Unable to reach 172.30.209.4 from 2.2.2.2.	

### 9.4.5 Tracing

To take a call trace, Select **Troubleshooting** → **Tracing** from the left-side menu as shown below.

Select the Packet Capture tab and set the desired configuration for a call trace, hit **Start Capture**. Only one interface can be selected at once, so only an inside or only an outside trace is possible.

<b>Packet Trace</b>	<b>Call Trace</b>	<b>Packet Capture</b>	<b>Captures</b>
Packet Capture Configuration			
Currently capturing	No		
Interface	A1		
Local Address (ip:port)	All :		
Remote Address (*, *:port, ip, ip:port)	*		
Protocol	All		
Maximum Number of Packets to Capture	1000		
Capture Filename <small>Existing captures with the same name will be overwritten</small>	Test_trace.pcap		
		<b>Start Capture</b>	<b>Clear</b>

When tracing is has reached the desired number of packets the trace will stop automatically, or alternatively, hit the Stop Capture button at the bottom.

<b>Packet Trace</b>	<b>Call Trace</b>	<b>Packet Capture</b>	<b>Captures</b>
Packet Capture Configuration			
Currently capturing	No		
Interface	A1		
Local Address (ip:port)	All :		
Remote Address (*, *:port, ip, ip:port)	*		
Protocol	All		
Maximum Number of Packets to Capture	1000		
Capture Filename <small>Existing captures with the same name will be overwritten</small>	Test_trace.pcap		
		<b>Start Capture</b>	<b>Clear</b>

Select the Captures tab at the top and you capture will be listed, you can select the File Name and choose to open it with an application like Wireshark.

<b>Packet Trace</b>	<b>Call Trace</b>	<b>Packet Capture</b>	<b>Captures</b>

## 10. Conclusion

As illustrated in these Application Notes, Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise can be configured to interoperate successfully with Verizon Business IP Trunk service, inclusive of the “2-CPE” SIP trunk redundancy architecture. This solution allows Avaya Aura® Communication Manager and Avaya Aura® Session Manager users access to the PSTN using a Verizon Business IP Trunk public SIP trunk service connection.

## Appendix A: Unscreened ANI Testing and Configuration

Unscreened ANI is a Verizon offered service (available with VoIP IP Integrated Access and VoIP IP Trunking) and is a new feature being offered with Session Manager 6.2. This service was tested successfully in this test configuration and can be implemented by following the steps here.

This feature allows Customer to send an “unscreened” ANI to the Company’s network which is then displayed to the called party as Caller ID. An “unscreened” ANI can be any telephone number that Customer passes through the Company’s network for Caller ID display purposes only. There is no charge for this feature. If Customer selects this feature, Verizon will designate one of Customer’s assigned telephone numbers as a “Screened Telephone Number” for each Customer unique location. Verizon will use the Screened Telephone Number to determine call origination for billing, call routing and E911 support. The customer is responsible for configuring its IP-PBX, PBX or other devices to accommodate and properly process the Screened Telephone Number.

The Screened Telephone Number provided by Verizon for this test is 732-945-0821. Typically, customers would have one or more screened telephone number, one for every location and a central Session Manager could be used to pass multiple screened telephone numbers to Verizon based on a Matching Pattern (i.e. a user’s Calling Line Identification).

Login to Session Manager as shown in **Section 6** above, navigate to Routing→Adaptations, and select “New”.

Create a unique name for the Adaptation, here “Verizon\_Test”. Select the “VerizonAdapter” for the **Module Name**. In module parameter enter any domain adaptations that may be needed. Here the domains known to Verizon needed to overwrite the internal lab environment name of “avayalab.com” so a **Module Parameter** of “osrcd=adevc.avaya.globalipcom.com odstd=pcelban0001.avayalincroft.globalipcom.com fromto=true” was used.

Adaptation Details	
<b>General</b>	
* Adaptation name:	<input type="text" value="Verizon_Test"/>
Module name:	<input type="text" value="VerizonAdapter"/>
Module parameter:	<input type="text" value="osrcd=adevc.avaya.globalipcom.c"/>
Egress URI Parameters:	<input type="text"/>
Notes:	<input type="text"/>

Scroll down to the **Digit Conversion for Outgoing Calls from SM** section, enter a **Matching Pattern** (e.g. 732-945-0240), with the **Min** and **Max** number of digits to match on, in **Address to modify**, enter **origination**, and in the **Adaptation Data** enter the screened telephone number (e.g. 732-945-0821) provided by Verizon. Click **Commit**.

**Digit Conversion for Outgoing Calls from SM**

Add Remove

3 Items Refresh Filter: Enable

<input type="checkbox"/>	Matching Pattern	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes
<input type="checkbox"/>	* 7329450240	* 10	* 10		* 0		origination	7329450821	
<input type="checkbox"/>	* 7329450285	* 10	* 10		* 0		origination	7329450821	
<input type="checkbox"/>	* 7329450287	* 10	* 10		* 0		origination	7329450821	

Select : All, None

Once the Adaptation has been committed it needs to be applied to a SIP Entity. Back at the Routing screen, select SIP Entities as shown in the Session manager section above, and select the “Avaya-SBCE-1” entity. Under Adaptation, change to the newly created “Verizon\_Test” adaptation.

**SIP Entity Details**

**General**

\* Name: Avaya-SBCE-1

\* FQDN or IP Address: 10.80.140.141

Type: Other

Notes: Sipera-SBC-1 Outside 2.2.2.2

Adaptation: Verizon\_Test

Location: Avaya-SBCE-1

## Verification

In the following filter Wireshark trace, it is observed that the From line contains the DID number, 732-945-0240 and in the p-asserted identity section, a Diversion header has been added with the screened ANI (732-945-0821).
