

Avaya Solution & Interoperability Test Lab

Application Notes for Configuring PaeTec SIP Trunking with Avaya IP Office 7.0 - Issue 1.0

Abstract

These Application Notes describe the procedures for configuring Session Initiation Protocol (SIP) Trunking between service provider PaeTec and Avaya IP Office 7.0.

PaeTec SIP Trunking provides PSTN access via a SIP trunk between the enterprise and the PaeTec network as an alternative to legacy analog or digital trunks. This approach generally results in lower cost for the enterprise.

PaeTec is a member of the Avaya DevConnect Service Provider program. Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the procedures for configuring Session Initiation Protocol (SIP) Trunking between service provider PaeTec and an Avaya IP Office solution. In the sample configuration, the Avaya IP Office solution consists of an Avaya IP Office 500v2 Release 7.0, Avaya Voicemail Pro, Avaya IP Office Softphone, and Avaya SIP, H.323, digital, and analog endpoints.

The PaeTec SIP Trunking service referenced within these Application Notes is designed for business customers. The service enables local and long distance PSTN calling via standards-based SIP trunks as an alternative to legacy analog or digital trunks, without the need for additional TDM enterprise gateways and the associated maintenance costs.

The PaeTec SIP Trunking service requires the enterprise IP PBX to Register with the SIP network via SIP credentials. This authentication scheme, as specified in SIP RFC 3261, provides security and identity verification for SIP signaling between the service provider and the enterprise.

2. General Test Approach and Test Results

The general test approach was to configure a simulated enterprise site using Avaya IP Office to connect to PaeTec SIP Trunking service. This configuration (shown in **Figure 1**) was used to exercise the features and functionality tests listed in **Section 2.1**.

2.1. Interoperability Compliance Testing

A simulated enterprise site with Avaya IP Office was connected to PaeTec SIP Trunking service. To verify SIP trunking interoperability, the following features and functionality were exercised during the interoperability compliance test:

- Registration to the PaeTec SIP network.
- Response to SIP OPTIONS queries.
- Incoming PSTN calls to various phone types. Phone types included SIP, H.323, digital, and analog telephones at the enterprise. All inbound PSTN calls were routed to the enterprise across the SIP trunk from the service provider.
- Outgoing PSTN calls from various phone types. Phone types included SIP, H.323, digital, and analog telephones at the enterprise. All outbound PSTN calls were routed from the enterprise across the SIP trunk to the service provider.
- Inbound and outbound PSTN calls to/from the Avaya IP Office Softphone.
- Inbound and outbound long hold time call stability.
- Various call types including: local, long distance, international, outbound toll-free, operator service and directory assistance.
- Codec G.711MU and G.729A.
- Caller number/ID presentation.
- Privacy requests (i.e., caller anonymity) and Caller ID restriction for inbound and outbound calls.
- DTMF transmission using RFC 2833.

- Voicemail navigation for inbound and outbound calls.
- Telephony features such as hold and resume, transfer, and conference.
- Off-net call forwarding.
- Twinning to mobile phones on inbound calls.

2.2. Test Results

PaeTec SIP Trunking passed compliance testing.

Items not supported or not tested included the following:

- Inbound toll-free and outbound emergency calls (911) are supported but were not tested as part of the compliance test.
- Faxing between the enterprise site and PSTN was tested over G.711MU as part of the compliance test but was not tested using t.38 since PaeTec does not currently support T.38 FoIP (Fax over IP) on its SIP Trunking production system.
- Interoperability testing of PaeTec SIP Trunking was completed with successful results for all test cases.

2.3. Support

For technical support on the Avaya products described in these Application Notes visit <http://support.avaya.com>.

For technical support on PaeTec SIP Trunking, contact PaeTec at <http://www.paetec.com/>

3. Reference Configuration

Figure 1 below illustrates the test configuration. The test configuration shows an enterprise site connected to PaeTec SIP Trunking service through the public IP network.

Located at the enterprise site is an Avaya IP Office 500v2 with the COMBO6210/ATM4 expansion card which provides connections for 6 digital stations, 2 analog stations, 4 analog trunks to the PSTN as well as 10-channel VCM (Voice Compression Module) for supporting VoIP codecs. The LAN port of Avaya IP Office is connected to the enterprise LAN while the WAN port is connected to the public IP network. Endpoints include an Avaya 1600 Series IP Telephone (with H.323 firmware), an Avaya 1120e Series IP Telephone (with SIP firmware), an Avaya 1408 Digital Telephone, an Avaya Analog Telephone and an Avaya IP Office Softphone. The site also has a Windows 2003 Server running Avaya Voicemail Pro for providing voice messaging service to the Avaya IP Office users. A separate Windows XP PC runs Avaya IP Office Manager to configure and administer the Avaya IP Office.

Mobility Twinning is configured for some of the Avaya IP Office users so that calls to these user phones will also ring and can be answered at the configured mobile phones.

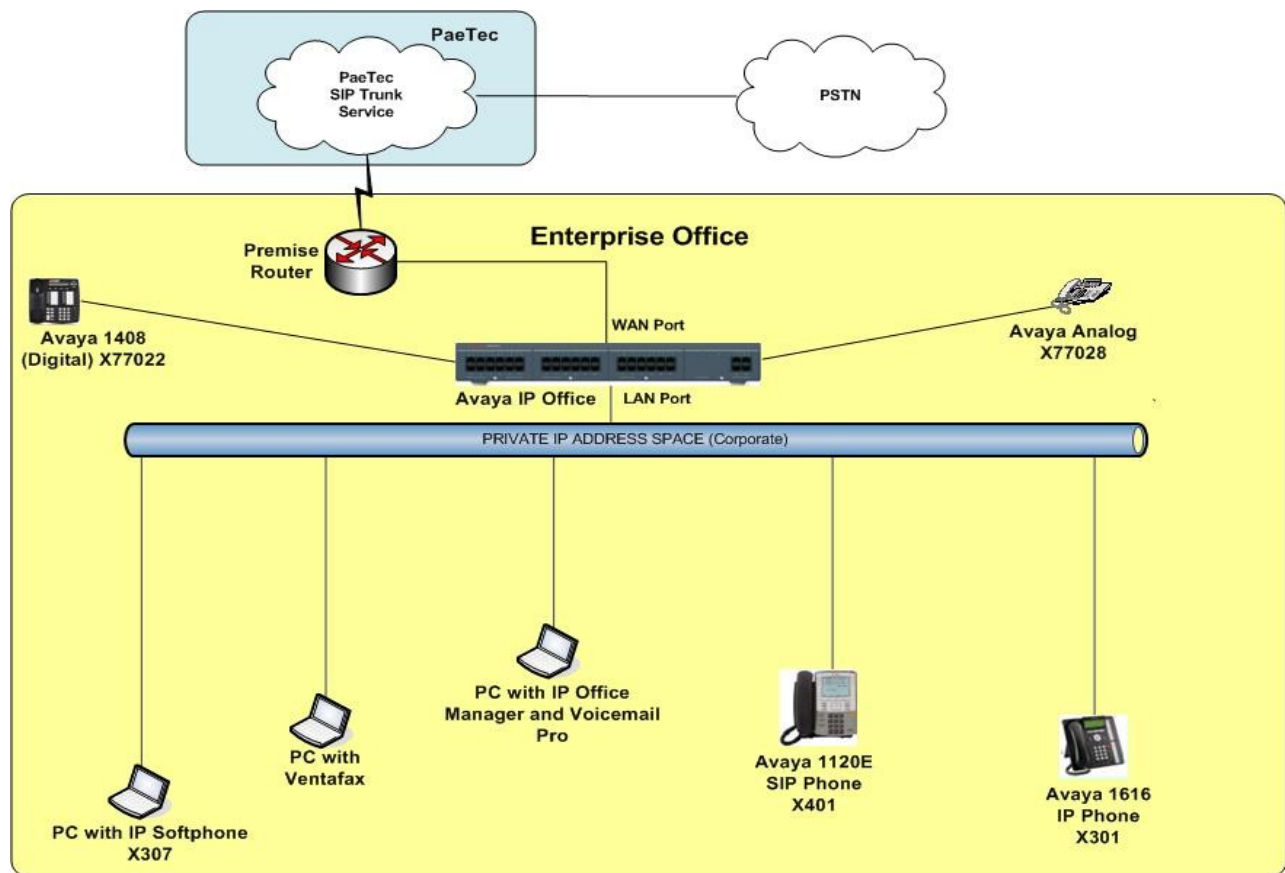

Figure 1: Test Configuration for Avaya IP Office with PaeTec SIP Trunking Service

For security purposes, the real public IP addresses and PSTN routable phone numbers used in the compliance test are masked in these Application Notes.

For the purposes of the compliance test, Avaya IP Office users dialed a short code of 9 + N digits to send digits across the SIP trunk to PaeTec. The short code of 9 was stripped off by Avaya IP Office but the remaining N digits were sent unaltered to PaeTec. For calls within the North American Numbering Plan (NANP), the user would dial 11 (1 + 10) digits. Thus for these NANP calls, Avaya IP Office would send 11 digits in the Request URI and the To headers of an outbound SIP INVITE message. IP Office was configured to send 10 digits in the From and PAI headers. For inbound calls, PaeTec SIP Trunking sent 10 digits in the Request URI, To, and From headers of inbound SIP INVITE messages.

In an actual customer configuration, the enterprise site may also include additional network components between the service provider and Avaya IP Office such as a session border controller or data firewall. A complete discussion of the configuration of these devices is beyond the scope of these Application Notes. However, it should be noted that SIP and RTP traffic between the service provider and Avaya IP Office must be allowed to pass through these devices.

4. Equipment and Software Validated

The following equipment and software/firmware were used for the sample configuration provided:

Avaya Telephony Components	
Equipment	Release
Avaya IP Office 500v2	7.0 (5)
Avaya IP Office COMBO6210/ATM4 Module	7.0 (5)
Avaya Voicemail Pro	7.0.17
Avaya IP Office Manager	9.0 (5)
Avaya 1616 IP Telephone (H.323)	Avaya one-X Deskphone Value Edition 1.2.2
Avaya 1120E IP Telephone (SIP)	SIP1120 version 04.01.13.00
Avaya 1408 Digital Telephone	N/A
Avaya Analog Telephone	N/A
Avaya IP Office Softphone	3.1.2.17 59616
PaeTec SIP Trunking	
Equipment	Release
Acme Packet Net-Net 4250 SBC	Firmware SC6.2.0 Patch 3 (Build 497)
BroadWorks Soft Switch	Rel14.sp9. 1.123
Media Gateways	
• Lucent LCS	3.14.4.7
• Genband G9	7.3 Bundle 403

5. Configure IP Office

This section describes the Avaya IP Office configuration to support connectivity to PaeTec SIP Trunking service. Avaya IP Office is configured through the Avaya IP Office Manager PC application. From a PC running the Avaya IP Office Manager application, select **Start → Programs → IP Office → Manager** to launch the application. Navigate to **File → Open Configuration**, select the proper Avaya IP Office system from the pop-up window, and log in with the appropriate credentials. A management window will appear similar to the one shown in the next section. The appearance of the IP Office Manager can be customized using the **View** menu. In the screens presented in this section, the View menu was configured to show the Navigation pane on the left side, the Group pane in the center, and the Details pane on the right side. These panes will be referenced throughout the Avaya IP Office configuration. Proper licensing as well as standard feature configurations that are not directly related to the interface with the service provider (such as LAN interface to the enterprise site and IP Office Softphone support) is assumed to be already in place.

5.1. LAN2 Settings

In the sample configuration, the MAC address **00E00705B33F** was used as the system name and the WAN port was used to connect the Avaya IP Office to the public network. The LAN2 settings correspond to the WAN port on the Avaya IP Office. To access the LAN2 settings, first navigate to **System (1) → 00E00705B33F** in the Navigation and Group panes and then navigate to the **LAN2→**

LAN Settings tab in the Details pane. Set the **IP Address** field to the IP address assigned to the Avaya IP Office WAN port. Set the **IP Mask** field to the mask used on the public network. All other parameters should be set according to customer requirements.

The screenshot displays the Avaya IP Office configuration interface. On the left, the 'IP Offices' pane shows a tree structure with 'System (1)' selected. The 'System' pane in the center shows the system name '00E00705B33F'. The right pane shows the 'LAN Settings' tab for the selected system. The 'LAN Settings' tab is active, and the 'IP Address' is set to '205 . 1 . 1 . 19' and the 'IP Mask' is set to '255 . 255 . 255 . 128'. Other settings include 'Primary Trans. IP Address' as '0 . 0 . 0 . 0', 'Firewall Profile' as '<None>', 'RIP Mode' as 'None', and 'Number Of DHCP IP Addresses' as '1'. The 'DHCP Mode' is set to 'Disabled' with radio buttons for 'Server', 'Client', 'Dialin', and 'Disabled'. An 'Advanced' button is also present. At the bottom, there are 'OK', 'Cancel', and 'Help' buttons.

Select the **VoIP** tab as shown in the following screen. The **SIP Trunks Enable** box must be checked to enable the configuration of SIP trunks to PaeTec. The **RTP Port Number Range** can be customized to a specific range of receive ports for the RTP media. Based on this setting, Avaya IP Office would request RTP media be sent to a UDP port in the configurable range for calls using LAN2. Avaya IP Office can also be configured to mark the Differentiated Services Code Point (DSCP) in the IP Header with specific values to support Quality of Services policies for both signaling and media. The **DSCP** field is the value used for media and the **SIG DSCP** is the value used for signaling. The specific values used for the compliance test are shown in the example below. All other parameters should be set according to customer requirements.

The screenshot displays the Avaya IP Office configuration window for system 00E00705B33F. The left pane shows a tree view of system components, with 'System (1)' selected. The main pane is divided into tabs: System, LAN1, LAN2, DNS, Voicemail, Telephony, Directory Services, System Events, SMTP, SMDR, and Twi. The 'LAN2' tab is active, showing the 'VoIP' configuration section. The 'SIP Trunks Enable' checkbox is checked. The 'RTP Port Number Range' is set to a minimum of 49152 and a maximum of 53246. The 'DiffServ Settings' section shows DSCP (Hex) as 88, DSCP Mask (Hex) as FC, and SIG DSCP (Hex) as 88. The 'DHCP Settings' section shows Primary Site Specific Option Number (SSON) as 176, Secondary Site Specific Option Number (SSON) as 242, and VLAN as Not Present. The 'RTP Keepalives' section shows Scope as Disabled and Periodic as 0.

System	LAN1	LAN2	DNS	Voicemail	Telephony	Directory Services	System Events	SMTP	SMDR	Twi
<p>VoIP</p> <p><input type="checkbox"/> H323 Gatekeeper Enable</p> <p><input checked="" type="checkbox"/> SIP Trunks Enable</p> <p><input type="checkbox"/> SIP Registrar Enable</p> <p><input checked="" type="checkbox"/> H323 Auto-create Extn</p> <p><input type="checkbox"/> H323 Auto-create User</p> <p><input checked="" type="checkbox"/> Enable RTPC Monitoring On Port 5005</p> <p>RTP Port Number Range</p> <p>Port Range (Minimum): 49152</p> <p>Port Range (Maximum): 53246</p> <p>DiffServ Settings</p> <p>88 DSCP (Hex) FC DSCP Mask (Hex) 88 SIG DSCP (Hex)</p> <p>46 DSCP 63 DSCP Mask 34 SIG DSCP</p> <p>DHCP Settings</p> <p>Primary Site Specific Option Number (SSON): 176</p> <p>Secondary Site Specific Option Number (SSON): 242</p> <p>VLAN: Not Present</p> <p>1100 Voice VLAN Site Specific Option Number (SSON): 232</p> <p>1100 Voice VLAN IDs:</p> <p>RTP Keepalives</p> <p>Scope: Disabled Periodic: 0</p>										

On the **Network Topology** tab in the Details pane, configure the following parameters:

- Select the **Firewall/NAT Type** from the pull-down menu that matches the network configuration. No firewall or network address translation (NAT) device was used in the compliance test as shown in **Figure 1**, so the parameter was set to **Open Internet**. With this configuration, STUN will not be used.
- Set **Binding Refresh Time (seconds)** to **60**. This value is used as one input to determine the frequency at which Avaya IP Office will send SIP OPTIONS messages to the service provider. See **Section 5.10** for complete details.
- Set **Public IP Address** to the IP address of the Avaya IP Office WAN port.
- All other parameters should be set according to customer requirements.

The screenshot displays the Avaya IP Office configuration window. The title bar shows the identifier '00E00705B33F*'. The 'Network Topology' tab is selected within the 'VoIP' section. The 'Network Topology Discovery' panel contains the following settings:

- STUN Server IP Address: 69 . 90 . 168 . 13
- STUN Port: 3478
- Firewall/NAT Type: Open Internet (selected from a dropdown menu)
- Binding Refresh Time (seconds): 60
- Public IP Address: 205 . 1 . 1 . 19
- Public Port: 5060

At the bottom of the panel are two buttons: 'Run STUN' and 'Cancel'. Below the panel is a checkbox labeled 'Run STUN on startup', which is currently unchecked. The main window has a bottom bar with 'OK', 'Cancel', and 'Help' buttons.

In the compliance test, the LAN1 interface was used to connect the Avaya IP Office to the enterprise site IP network. The LAN1 interface configuration is not directly relevant to the interface with PaeTec SIP Trunking service, and therefore is not described in these Application Notes.

5.2. System Telephony Settings

Navigate to the **Telephony** → **Telephony** tab in the Details pane. Set the **Automatic Codec Preference** for the default codec to be used for intra-enterprise traffic. Choose the **Companding Law** typical for the enterprise location. For North America, **ULAW** is used. Uncheck the **Inhibit Off-Switch Forward/Transfer** box to allow call forwarding and call transfer to the PSTN via the service provider across the SIP trunk.

The screenshot shows the 'Telephony' configuration window in Avaya System Manager. The window title is '00E00705B33F*'. The 'Telephony' tab is selected, and the 'Analogue Extensions' sub-tab is active. The configuration is divided into two main sections: 'Analogue Extensions' on the left and 'Companding Law' on the right.

Analogue Extensions:

- Default Outside Call Sequence: Normal (dropdown)
- Default Inside Call Sequence: Ring Type 1 (dropdown)
- Default Ring Back Sequence: Ring Type 2 (dropdown)
- Restrict Analogue Extension Ringer Voltage: ☐
- Dial Delay Time (secs): 4 (spinner)
- Dial Delay Count: 0 (spinner)
- Default No Answer Time (secs): 15 (spinner)
- Hold Timeout (secs): 120 (spinner)
- Park Timeout (secs): 300 (spinner)
- Ring Delay (secs): 5 (spinner)
- Call Priority Promotion Time (secs): Disabled (dropdown)
- Default Currency: USD (dropdown)
- Automatic Codec Preference: G.729(a) 8K CS-ACELP (dropdown)

Companding Law:

- Switch:** ☒ ULAW, ☐ ALAW
- Line:** ☒ UL, ☐ AL
- DSS Status: ☐
- Auto Hold: ☒
- Dial By Name: ☒
- Show Account Code: ☒
- Inhibit Off-Switch Forward/T: ☐
- Restrict Network Interconne: ☐
- Drop External Only Impromp: ☐
- Visually Differentiate Extern: ☐

At the bottom of the window are three buttons: OK, Cancel, and Help.

5.3. Twinning Calling Party Settings

When using twinning, the calling party number displayed on the twinned phone is controlled by two parameters. The first parameter is the **Send original calling party information for Mobile Twinning** box on the **System→Twinning** tab. The second parameter is the **Send Caller ID** parameter on the **SIP Line** form (shown in **Section 5.4**).

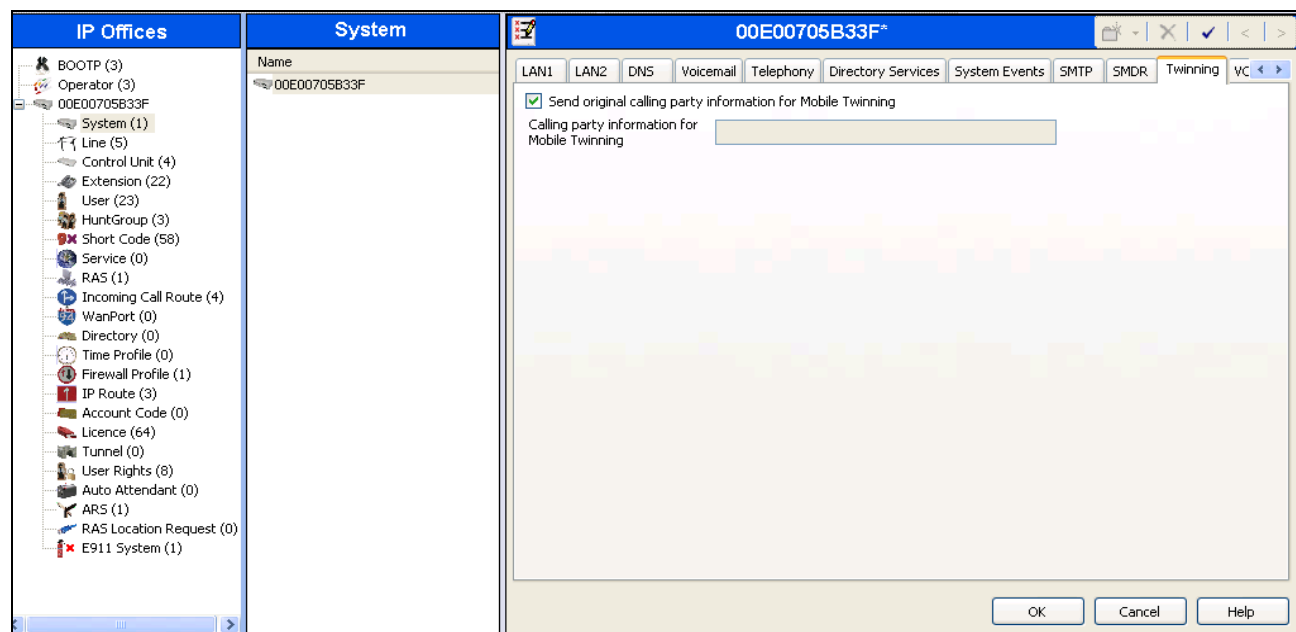

If **Send original calling party information for Mobile Twinning** on the **System→Twinning** tab is set, the setting of the second parameter is ignored and Avaya IP Office will send the following in the SIP From Header:

- On calls from an internal extension to a twinned phone, Avaya IP Office will send the calling party number of the originating extension.
- On calls from the PSTN to a twinned phone, Avaya IP Office will send the calling party number of the host phone associated with the twinned destination (instead of the number of the originating caller).

The above behavior in Avaya IP Office Release 7 is the same as in Avaya IP Office Release 6 and was tested and verified in the compliance test.

Avaya IP Office Release 7 also provides an alternative method of sending caller ID through SIP Diversion header (configured via unchecking **Send original calling party information for Mobile Twinning** here then selecting **Diversion Header** for the **Send Caller ID** parameter on the **SIP Line** form in **Section 5.4**). This alternative configuration could provide more accurate caller ID information if the service provider supports the SIP Diversion header (not tested in the compliance test).

For the compliance test, the **Send original calling party information for Mobile Twinning** box in the **System→Twinning** tab was checked which overrides any setting of the **Send Caller ID** parameter on the **SIP Line** form.

5.4. Administer SIP Line

A SIP line is needed to establish the SIP connection between Avaya IP Office and PaeTec SIP Trunking service. To create a SIP line, begin by navigating to **Line** in the left Navigation pane, then right-click in the Group pane and select **New → SIP Line**. On the **SIP Line** tab in the Details pane, configure the parameters as shown below:

- Set **ITSP Domain Name** to the enterprise domain, or the IP address of the IP Office WAN interface, so that IP Office uses this domain / IP address as the host portion of SIP URI in SIP headers such as the From header.
- Set **Send Caller ID** to **None**. For the compliance test, this parameter was ignored since **Send original calling party information for Mobile Twinning** is optioned in **Section 5.3**.
- Check the **In Service** box.
- Check the **Check OOS** box. With this option selected, IP Office will use the SIP OPTIONS method to periodically check the SIP line.
- Default values may be used for all other parameters.

The area of the screen entitled **REFER Support** is used to enable/disable SIP REFER for call transfers. The default values of “Auto” for **Incoming** and **Outgoing** effectively disable use of SIP REFER. To enable SIP REFER, select “Always” from the drop-down menu for **Incoming** and **Outgoing**.

The screenshot displays the Avaya IP Office configuration interface. On the left, the 'IP Offices' pane shows a tree structure with 'Line' selected. The 'Line' pane shows a list of lines, with 'Line 17' (SIP Line) selected. The main pane shows the 'SIP Line - Line 17' configuration window. The 'SIP Line' tab is active, showing the following configuration:

Parameter	Value	Option/Status
Line Number	17	
ITSP Domain Name	205.1.1.19	
Prefix		
National Prefix	0	
Country Code		
International Prefix	00	
Send Caller ID	None	
Association Method	By Source IP address	
REFER Support		
Incoming	Auto	
Outgoing	Auto	
In Service		<input checked="" type="checkbox"/>
Use Tel URI		<input type="checkbox"/>
Check OOS		<input checked="" type="checkbox"/>
Call Routing Method	Request URI	
Originator number for forwarded and twinning calls	7133433763	

At the bottom of the window are 'OK', 'Cancel', and 'Help' buttons.

Select the **Transport** tab. The **ITSP Proxy Address** is set to the PaeTec SIP Proxy IP Address provided by PaeTec, as shown in **Figure 1**. This IP Address is **64.1.1.220**. In the **Network Configuration** area, **UDP** is selected as the **Layer 4 Protocol**, and the **Send Port** is set to the port number provided by PaeTec. The **Use Network Topology Info** parameter is set to **LAN 2**. This associates the SIP line with the parameters in the **System → LAN2 → Network Topology** tab. Other parameters retain default values in the screen below.

The screenshot shows the 'SIP Line - Line 17*' configuration window with the 'Transport' tab selected. The window has a title bar with a standard icon and navigation buttons. Below the title bar are tabs for 'SIP Line', 'Transport', 'SIP URI', 'VoIP', 'T38 Fax', and 'SIP Credentials'. The 'Transport' tab is active, showing the following configuration fields:

- ITSP Proxy Address:** A text field containing '64.1.1.220'.
- Network Configuration:** A section containing:
 - Layer 4 Protocol:** A dropdown menu set to 'UDP'.
 - Send Port:** A spinner box set to '5060'.
 - Use Network Topology Info:** A dropdown menu set to 'LAN 2'.
 - Listen Port:** A spinner box set to '5060'.
- Explicit DNS Server(s):** Two groups of IP address input fields, both set to '0 . 0 . 0 . 0'.
- Calls Route via Registrar:** A checkbox that is checked.
- Separate Registrar:** An empty text field.

At the bottom of the window are three buttons: 'OK', 'Cancel', and 'Help'.

A SIP Credentials entry must be created for Digest Authentication used by PaeTec SIP trunking service to authenticate Registration of the IP PBX for calls from the enterprise to the PSTN. To create a SIP Credentials entry, first select the **SIP Credentials** tab. Click the **Add** button and the **New SIP Credentials** area will appear at the bottom of the pane. To edit an existing entry, click an entry in the list at the top, and click the **Edit...** button. In the bottom of the screen, the **Edit SIP Credentials** area will be opened. In the example screen below, a previously configured entry is edited. The entry was created with the parameters shown below:

- Set **User name** and **Authentication Name** to the value provided by the service provider.
- Set **Password** to the value provided by the service provider if required. (NOTE: PaeTec did not require a password for the compliance test).
- Check the **Registration required** option. PaeTec requires registration of the IP PBX for the SIP trunking service.

The screenshot shows a software window titled "SIP Line - Line 17*". It has several tabs: "SIP Line", "Transport", "SIP URI", "VoIP", "T38 Fax", and "SIP Credentials". The "SIP Credentials" tab is active. Inside this tab, there is a table with the following data:

Index	UserName	Authentication Name	Contact	Expiry	Register
1	7135553763	7135553763		60	True

To the right of the table are buttons: "Add...", "Remove", and "Edit...". Below the table is a section titled "Edit SIP Credentials" with the following fields:

- User name: 7135553763
- Authentication Name: 7135553763
- Contact: (empty field)
- Password: (empty field)
- Expiry: 60 (with a spinner control)
- Registration required: ☒

At the bottom right of the "Edit SIP Credentials" section are "OK" and "Cancel" buttons. At the very bottom of the window are "OK", "Cancel", and "Help" buttons.

A SIP URI entry must be created to match each incoming number that Avaya IP Office will accept on this line. Select the **SIP URI** tab, and then click the **Add** button, the **New Channel** area will appear at the bottom of the pane. To edit an existing entry, click an entry in the list at the top, and click the **Edit...** button. In the example screen below, a previously configured entry is edited. For the compliance test, a single SIP URI entry was created that matched any DID number assigned to an Avaya IP Office user. The entry was created with the parameters shown below:

- Set **Local URI**, **Contact** and **Display Name** to *Use Internal Data*. This setting allows calls on this line for SIP URIs that match the number set in the **SIP** tab of any **User** as shown in **Section 5.6**.
- Set **PAI** to *Use Internal Data*. With this setting IP Office will populate the SIP P-Asserted-Identity header on outgoing calls with the data set in the **SIP** tab of the **User** initiating the call as shown in **Section 5.6**.
- For **Registration**, select the account credentials previously configured on the line's **SIP Credentials** tab.
- Associate this line with an incoming line group in the **Incoming Group** field. This line group number will be used in defining incoming call routes for this line. Similarly, associate the line to an outgoing line group using the **Outgoing Group** field. For the compliance test, a new incoming and outgoing line group **17** was defined.
- Set **Max Calls per Channel** to the number of simultaneous SIP calls that are allowed using this SIP URI pattern.

SIP Line - Line 17

Tabs: SIP Line | Transport | **SIP URI** | VoIP | T38 Fax | SIP Credentials

Channel	Groups	Via	Local URI	Contact	Display Name	PAI	Credential	Max Calls
1	17 17	2...				1: 7135...		10

Buttons: Add... | Remove | Edit... | OK | Cancel

Edit Channel

Via: 205.1.1.19

Local URI: Use Internal Data

Contact: Use Internal Data

Display Name: Use Internal Data

PAI: Use Internal Data

Registration: 1: 7135553763

Incoming Group: 17

Outgoing Group: 17

Max Calls per Channel: 10

Buttons: OK | Cancel | Help

Select the **VoIP** tab to set the Voice over Internet Protocol parameters of the SIP line. Set the parameters as shown below:

- The **Compression Mode** was configured using the **Advanced** button, allowing an explicit ordered list of codecs to be specified. Check marks next to **G.729(a) 8K CS-ACELP** and **G.711 ULAW** codecs cause Avaya IP Office to include these codecs, supported by the PaeTec SIP Trunking service, in the Session Description Protocol (SDP) offer, in that order.
- Set the **DTMF Support** field to **RFC2833**. This directs Avaya IP Office to send DTMF tones using RTP event messages as defined in RFC2833.
- Uncheck the **VoIP Silence Suppression** box. By unchecking the **VoIP Silence Suppression** box, calls can be established with the G.729 codec but without silence suppression.
- Select **G.711** for **Fax Transport Support**. T.38 faxing is not currently supported by PaeTec. G.711 pass-through faxing is supported by PaeTec and was successfully tested. **G.711** should be selected here.
- Check the **Re-invite Supported** box.
- Default values may be used for all other parameters.

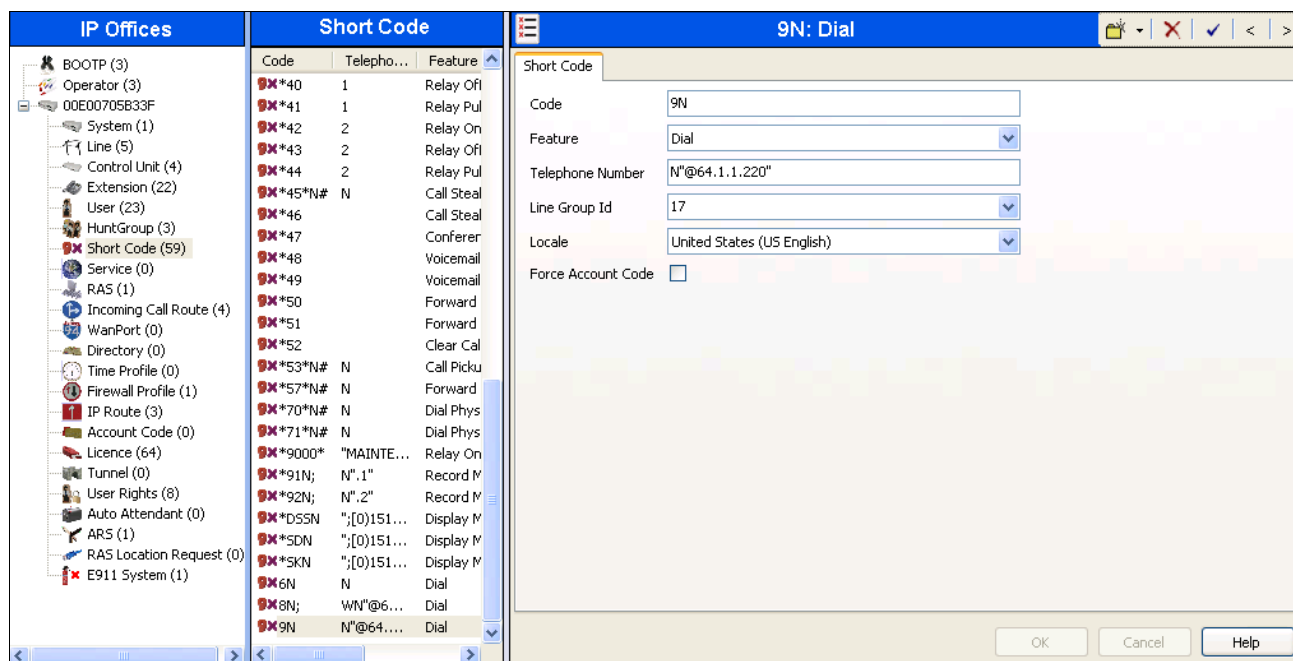

The screenshot shows the 'SIP Line - Line 17' configuration window with the 'VoIP' tab selected. The window has a title bar with standard icons and a toolbar with icons for help, save, delete, confirm, and navigation. Below the title bar are tabs for 'SIP Line', 'Transport', 'SIP URI', 'VoIP', 'T38 Fax', and 'SIP Credentials'. The 'VoIP' tab is active, showing various configuration options. On the left, there are labels for 'Compression Mode', 'Fax Transport Support', 'Call Initiation Timeout (s)', and 'DTMF Support'. The 'Compression Mode' section has an 'Advanced' button and a list of codecs: 'G.729(a) 8K CS-ACELP' (checked), 'G.711 ULAW 64K' (checked), 'G.711 ALAW 64K' (unchecked), and 'G.723.1 6K3 MP-MLQ' (unchecked). The 'Fax Transport Support' is set to 'G.711'. The 'Call Initiation Timeout (s)' is set to '6'. The 'DTMF Support' is set to 'RFC2833'. On the right, there are checkboxes for 'VoIP Silence Suppression' (unchecked), 'Re-invite Supported' (checked), 'Use Offerer's Preferred Codec' (checked), and 'Codec Lockdown' (unchecked). At the bottom, there are 'OK', 'Cancel', and 'Help' buttons.

Parameter	Value
Compression Mode	Advanced
Compression Mode List	<ul style="list-style-type: none"><input checked="" type="checkbox"/> G.729(a) 8K CS-ACELP<input checked="" type="checkbox"/> G.711 ULAW 64K<input type="checkbox"/> G.711 ALAW 64K<input type="checkbox"/> G.723.1 6K3 MP-MLQ
Fax Transport Support	G.711
Call Initiation Timeout (s)	6
DTMF Support	RFC2833
VoIP Silence Suppression	<input type="checkbox"/>
Re-invite Supported	<input checked="" type="checkbox"/>
Use Offerer's Preferred Codec	<input checked="" type="checkbox"/>
Codec Lockdown	<input type="checkbox"/>

5.5. Short Code

Define a short code to route outbound traffic to the SIP line. To create a short code, select **Short Code** in the left Navigation pane, then right-click in the Group pane and select **New**. On the **Short Code** tab in the Details pane, configure the parameters for the new short code to be created. The screen below shows the details of the previously administered “9N” short code used in the test configuration.

- In the **Code** field, enter the dial string which will trigger this short code, followed by a semi-colon. In this case, **9N**. This short code will be invoked when the user dials 9 followed by any number.
- Set **Feature** to **Dial**. This is the action that the short code will perform.
- Set **Telephone Number** to **N*64.1.1.220**. This field is used to construct the Request URI and To headers in the outgoing SIP INVITE message. The value **N** represents the number dialed by the user. The host part following the “@” is the domain or IP address of the service provider network.
- Set the **Line Group Id** to the outgoing line group number defined on the **SIP URI** tab on the **SIP Line** in **Section 5.4**. This short code will use this line group when placing the outbound call.

The simple “9N” short code illustrated above does not provide a means of alternate routing if the configured SIP line is out of service or temporarily not responding. When alternate routing options and/or more customized analysis of the digits following the short code are desired, the Automatic Route Selection (ARS) feature may be used. In the following example screen, the short code 6N is illustrated for access to ARS. When the Avaya IP Office user dials 6 plus any number N, rather than being directed to a specific **Line Group Id**, the call is directed to **Line Group ID “50: Main”**, configurable via ARS. See **Section 5.8** for example ARS route configuration for “50: Main” as well as a backup route.

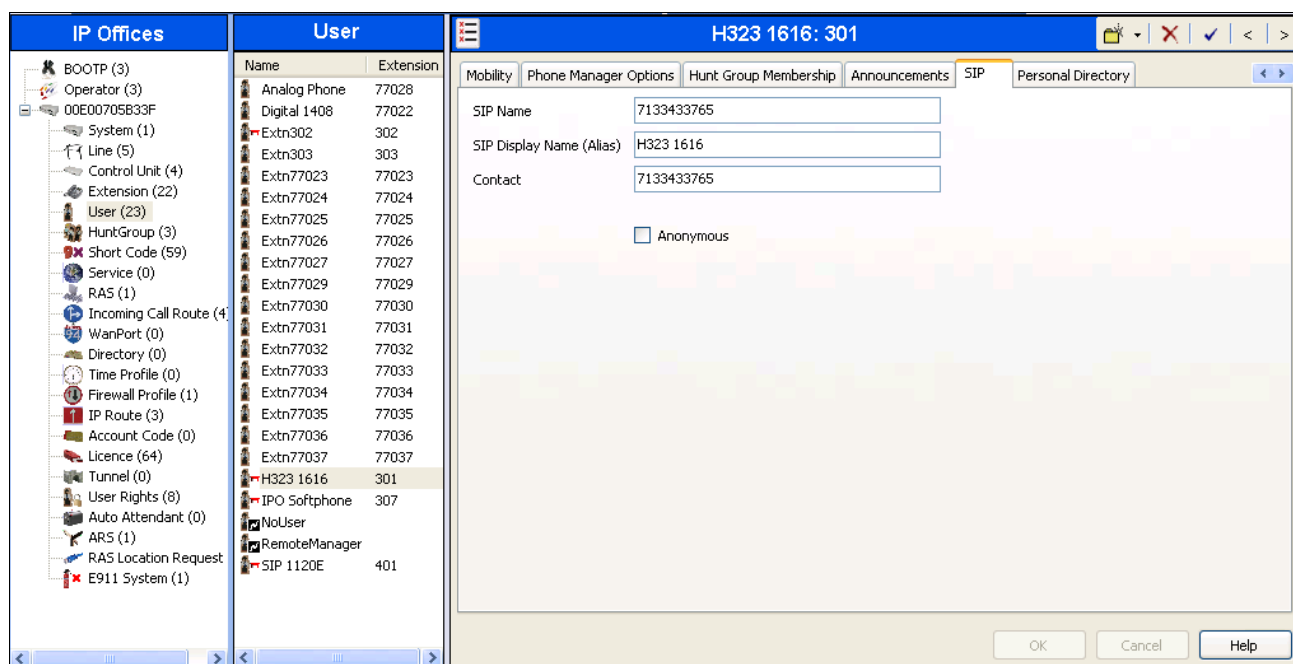

The screenshot shows a configuration window titled "6N: Dial". It contains the following fields and controls:

- Short Code** (tab):
- Code**: Text field containing "6N".
- Feature**: Dropdown menu showing "Dial".
- Telephone Number**: Text field containing "N".
- Line Group Id**: Dropdown menu showing "50: Main".
- Locale**: Dropdown menu.
- Force Account Code**: Check box, currently unchecked.
- Buttons**: "OK", "Cancel", and "Help" at the bottom right.

5.6. User

Configure the SIP parameters for each user that will be placing and receiving calls via the SIP line defined in **Section 5.4**. To configure these settings, first select **User** in the left Navigation pane, then select the name of the user to be modified in the center Group pane. In the example below, the name of the user is H323 1616. Select the **SIP** tab in the Details pane.

The values entered for the **SIP Name** and **Contact** fields are used as the user part of the SIP URI in the From header for outgoing SIP trunk calls. They also allow matching of the SIP URI for incoming calls without having to enter this number as an explicit SIP URI for the SIP line (**Section 5.4**). The example below shows the settings for user H323 1616. The **SIP Name** and **Contact** are set to one of the DID numbers assigned to the enterprise from PaeTec. The **SIP Display Name (Alias)** parameter can optionally be configured with a descriptive name. If all calls involving this user and a SIP line should be considered private, then the **Anonymous** box may be checked to withhold the user's information from the network.

One of the H.323 IP phones at the enterprise site uses the Mobile Twinning feature. The following screen shows the **Mobility** tab for User H323 1616. The **Mobility Features** and **Mobile Twinning** boxes are checked. The **Twinned Mobile Number** field is configured with the number to dial to reach the twinned mobile telephone. Other options can be set according to customer requirements.

The screenshot shows a configuration window titled "H323 1616: 301*" with a blue header bar. Below the header is a tabbed interface with the following tabs: "Mobility", "Phone Manager Options", "Hunt Group Membership", "Announcements", "SIP", and "Personal Directory". The "Mobility" tab is selected. The "Internal Twinning" section is collapsed, showing a "Twinned Handset" dropdown set to "<None>" and a "Maximum Number of Calls" dropdown set to "1". Below this are three unchecked checkboxes: "Twin Bridge Appearances", "Twin Coverage Appearances", and "Twin Line Appearances". The "Mobility Features" section is expanded, showing a checked checkbox for "Mobility Features" and a checked checkbox for "Mobile Twinning". Under "Mobile Twinning", the "Twinned Mobile Number (including dial access code)" is set to "917205558022", the "Twinning Time Profile" is set to "<None>", the "Mobile Dial Delay (secs)" is set to "2", and the "Mobile Answer Guard (secs)" is set to "0". Below these are four unchecked checkboxes: "Hunt group calls eligible for mobile twinning", "Forwarded calls eligible for mobile twinning", "Twin When Logged Out", and "one-X Mobile Client". At the bottom of the "Mobility Features" section are three unchecked checkboxes: "Mobile Call Control" and "Mobile Callback". The window has a standard Windows-style scrollbar and "OK", "Cancel", and "Help" buttons at the bottom right.

H323 1616: 301*

5.7. Incoming Call Route

An incoming call route maps an inbound DID number on a specific line to an internal extension. This procedure should be repeated for each DID number provided by the service provider. To create an incoming call route, select **Incoming Call Route** in the left Navigation pane, then right-click in the center Group pane and select **New**. On the **Standard** tab of the Details pane, enter the parameters as shown below:

- Set the **Bearer Capability** to *Any Voice*.
- Set the **Line Group Id** to the incoming line group of the SIP line defined in **Section 5.4**.
- Set the **Incoming Number** to the incoming number on which this route should match.
- Default values can be used for all other fields.

The screenshot shows the 'Incoming Call Route' configuration window with the 'Standard' tab selected. The left pane shows a tree view of system components, with 'Incoming Call Route (4)' selected. The main pane displays the configuration for a route with Line Group Id 17 and Incoming Number 7133433765. The fields are as follows:

Field	Value
Bearer Capability	Any Voice
Line Group Id	17
Incoming Number	7133433765
Incoming Sub Address	
Incoming CLI	
Locale	United States (US English)
Priority	1 - Low
Tag	
Hold Music Source	System Source

On the **Destinations** tab, select the destination extension from the pull-down menu of the **Destination** field. In this example, incoming calls to 713-343-3765 on line 17 are routed to extension 301.

The screenshot shows the 'Incoming Call Route' configuration window with the 'Destinations' tab selected. The left pane shows the same tree view. The main pane displays a table of destinations for the route with Line Group Id 17 and Incoming Number 7133433765.

TimeProfile	Destination	Fallback Extension
Default Value	301 H323 1616	301 H323 1616

5.8. ARS and Alternate Routing

While detailed coverage of Automatic Route Selection (ARS) is beyond the scope of these Application Notes, this section includes basic ARS screen illustrations and considerations. ARS is illustrated here mainly to illustrate alternate routing should the SIP line be out of service or temporarily not responding.

Optionally, ARS can be used rather than the simple “9N” short code approach documented in **Section 5.5**. With ARS, a secondary dial tone can be provided after the access code, time-based routing criteria can be introduced, and alternate routing can be specified so that a call can re-route automatically if the primary route or outgoing line group is not available. Although not shown in this section, ARS also facilitates more specific dialed telephone number matching, enabling immediate routing and alternate treatment for different types of numbers following the access code. For example, if all 1+10 digit calls following an access code should use the SIP line preferentially, but other local or service numbers following the access code should prefer a different outgoing line group, ARS can be used to distinguish between these call behaviors.

To add a new ARS route, right-click **ARS** in the Navigation pane and select **New**. To view or edit an existing ARS route, select **ARS** in the Navigation pane, and select the appropriate route name in the Group pane.

The following screen shows an example ARS configuration for the route named “Main”. The **In Service** parameter refers to the ARS form itself, not the Line Groups that may be referenced in the form. If the **In Service** box is un-checked, calls are routed to the ARS route name specified in the **Out of Service Route** parameter. IP Office short codes may also be defined to allow an ARS route to be disabled or enabled from a telephone. The configurable provisioning of an Out of Service Route, and the means to manually activate the Out of Service Route, can be helpful for scheduled maintenance or other known service-affecting events for the primary route.

The screenshot displays the IP Office configuration interface for the ARS (Automatic Route Selection) feature. The left pane shows the 'IP Offices' tree with 'ARS (1)' selected. The main pane shows the configuration for the 'Main' route.

ARS Configuration Fields:

- ARS Route Id: 50
- Route Name: Main
- Dial Delay Time: System Default (4)
- In Service: ☒ (checked)
- Time Profile: <None>
- Secondary Dial tone: ☒ (checked), SystemTone
- Check User Call Barring: ☒ (checked)
- Out of Service Route: <None>
- Out of Hours Route: <None>

Table: Code, Telephone Number, Feature, Line Group Id

Code	Telephone Number	Feature	Line Group Id
11	911	Dial Emergency	0
911	911	Dial Emergency	0
0N;	0N	Dial 3K1	17
1N;	1N"@64.199.64.220"	Dial 3K1	17
XN;	N	Dial 3K1	0
XXXXXXXXXXN	N	Dial 3K1	0
011N	011N"@64.199.64.220"	Dial 3K1	17

Alternate Route Configuration:

- Alternate Route Priority Level: 3
- Alternate Route Wait Time: 30
- Additional Route: <None>

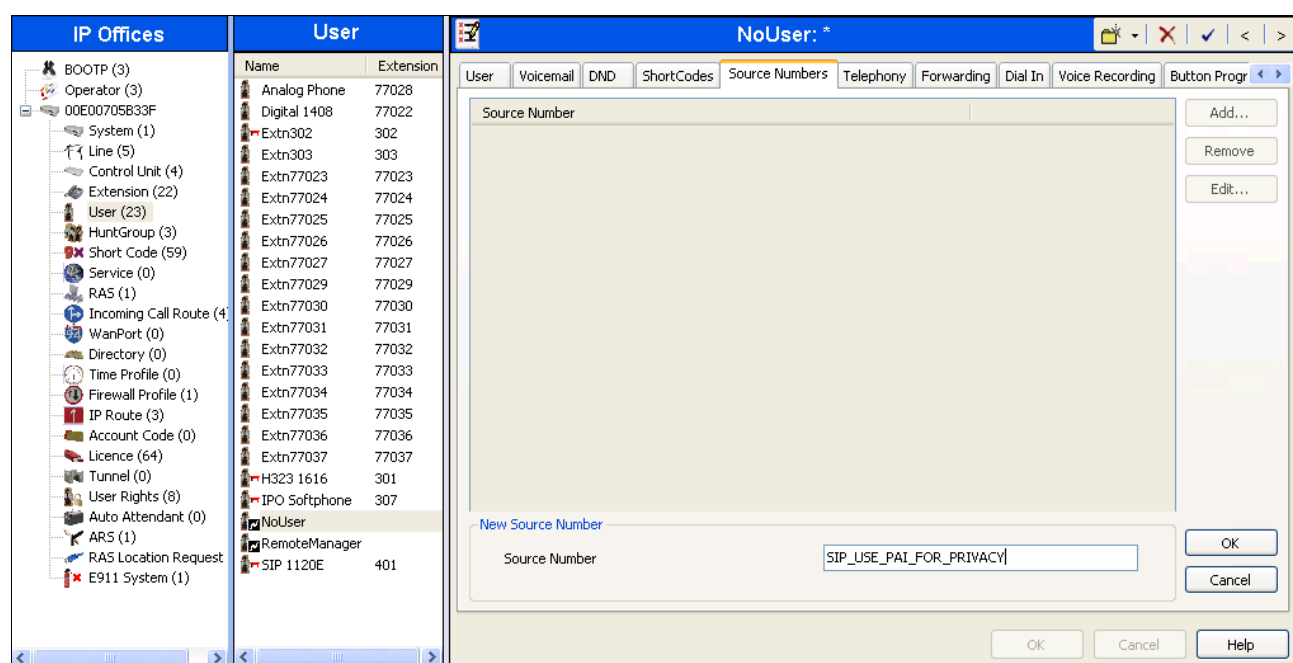

Buttons: OK, Cancel, Help

Assuming the primary route is in-service, the number passed from the short code used to access ARS (e.g., 6N in **Section 5.5**) can be further analyzed to direct the call to a specific Line Group ID. Per the example screen above, if the user dialed 6-1-713-555-1212, the call would be directed to Line Group 17, the SIP line configured and described in these Application Notes. If Line Group 17 cannot be used, the call can automatically route to the route name configured in the **Additional Route** parameter in the lower right of the screen (not configured for the compliance test). Since alternate routing can be considered a privilege not available to all callers, IP Office can control access to the alternate route by comparing the calling user's priority to the value in the **Alternate Route Priority Level** field.

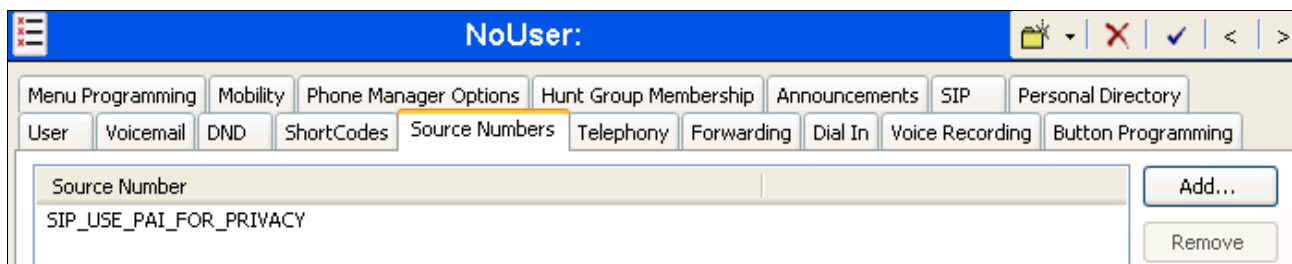

5.9. Privacy/Anonymous Calls

For outbound calls with privacy (anonymous) enabled, Avaya IP Office will replace the calling party number in the From and Contact headers of the SIP INVITE message with "restricted" and "anonymous" respectively. Avaya IP Office can be configured to use the P-Preferred-Identity (PPI) or P-Asserted-Identity (PAI) header to pass the actual calling party information for authentication and billing. For the compliance test, PAI was used for the purposes of privacy.

To configure Avaya IP Office to use PAI for privacy calls, navigate to **User → noUser** in the Navigation / Group panes. Select the **Source Numbers** tab in the Details pane. Click the **Add** button. At the bottom of the Details pane, the **Source Number** field will appear. Enter **SIP_USE_PA1_FOR_PRIVACY**. Click **OK**.

The **SIP_USE_PAID_FOR_PRIVACY** parameter will appear in the list of Source Numbers as shown below.

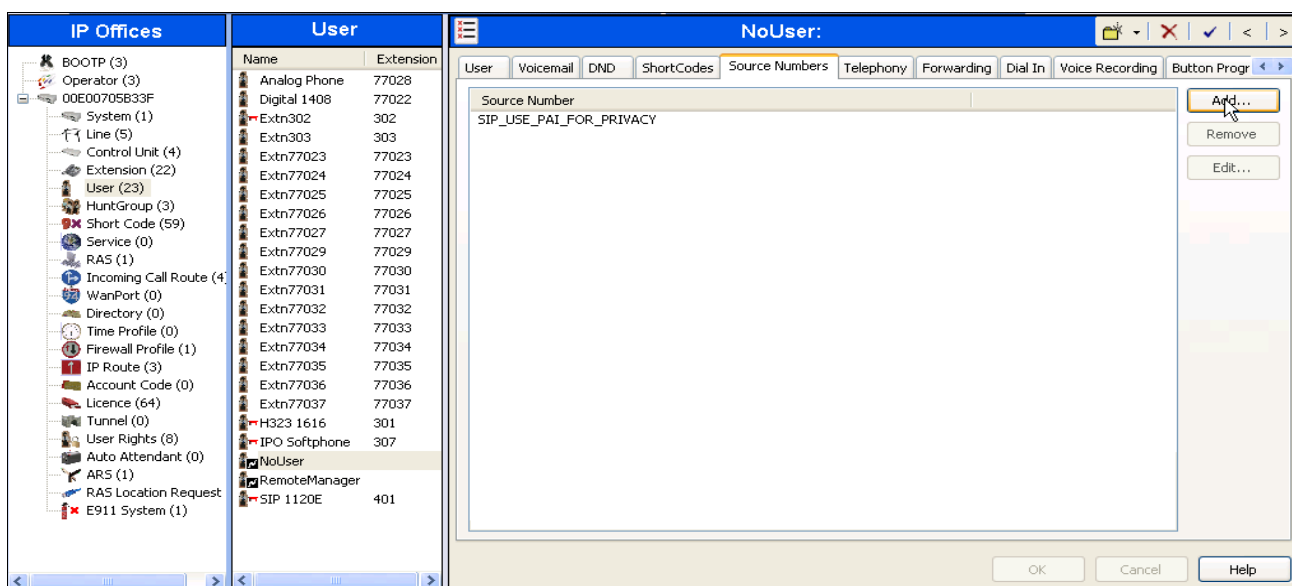

5.10. SIP Options

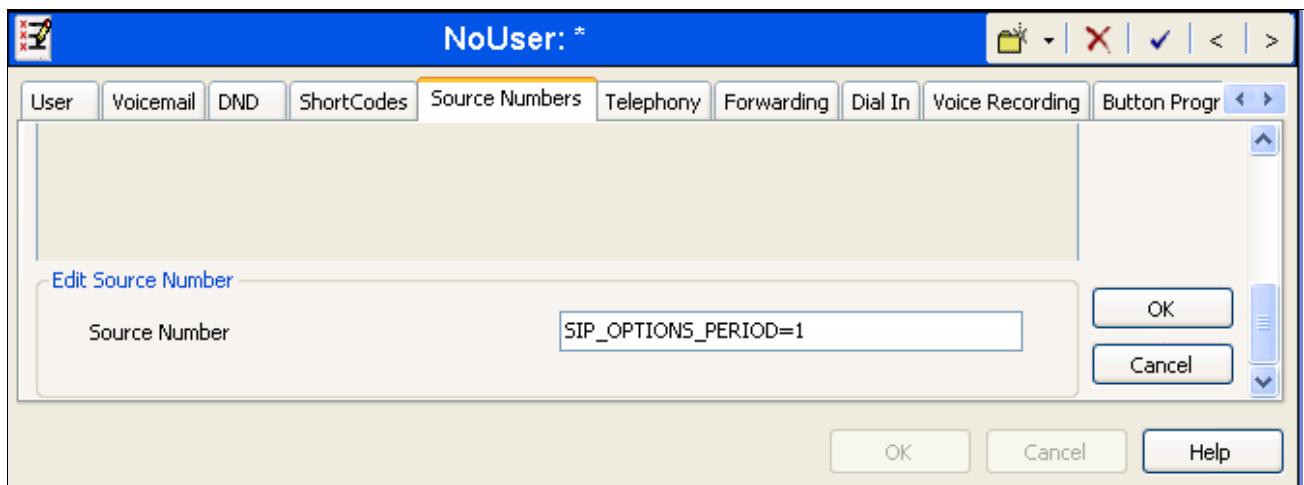

Avaya IP Office sends SIP OPTIONS messages periodically to determine if the SIP connection is active. The rate at which the messages are sent is determined by the combination of the **Binding Refresh Time** (in seconds) set on the **Network Topology** tab in **Section 5.1** and the **SIP_OPTIONS_PERIOD** parameter (in minutes) that can be set on the **Source Numbers** tab of the **NoUser** user. The OPTIONS period is determined in the following manner:

- If no **SIP_OPTIONS_PERIOD** parameter is defined and the **Binding Refresh Time** is 0, then the default value of 42seconds is used.
- To establish a period less than 42 seconds, do not define a **SIP_OPTIONS_PERIOD** parameter and set the **Binding Refresh Time** to a value less than 42 secs. The OPTIONS message period will be equal to the **Binding Refresh Time**.
- To establish a period greater than 42 seconds, a **SIP_OPTIONS_PERIOD** parameter must be defined. The **Binding Refresh Time** must be set to a value greater than 42 secs. The OPTIONS message period will be the smaller of the **Binding Refresh Time** and the **SIP_OPTIONS_PERIOD**.

To configure the **SIP_OPTIONS_PERIOD** parameter, navigate to **User → NoUser** in the Navigation / Group panes. Select the **Source Numbers** tab in the Details pane. Click the **Add** button.

At the bottom of the Details pane, the **Source Number** field will appear. Enter **SIP_OPTIONS_PERIOD=X**, where **X** is the desired value in minutes. Click **OK**.

The **SIP_OPTIONS_PERIOD** parameter will appear in the list of Source Numbers as shown below. For the compliance test, an OPTIONS period of 1 minute was desired. The **Binding Refresh Time** was set to **60** seconds (1 minute) in **Section 5.1**. The **SIP_OPTIONS_PERIOD** was set to **1** minutes. Avaya IP Office chose the OPTIONS period as the smaller of these two values (1 minute). Click the **OK** button (not shown).

5.11. Save Configuration

Navigate to **File → Save Configuration** in the menu bar at the top of the screen to save the configuration performed in the preceding sections.

6. PaeTec SIP Trunking Configuration

PaeTec is responsible for the configuration of PaeTec SIP Trunking service. The customer will need to provide the IP address used to reach the Avaya IP Office at the enterprise. PaeTec will provide the customer the necessary information to configure the Avaya IP Office SIP connection to PaeTec.

The provided information from PaeTec includes:

- IP address of the PaeTec SIP proxy.
- PaeTec SIP domain
- Supported codecs
- DID numbers
- IP addresses and port numbers used for signaling or media through any security devices.

7. Verification Steps

The following steps may be used to verify the configuration:

- Use the Avaya IP Office System Status application to verify the state of the SIP connection. Launch the application from **Start → Programs → IP Office → System Status** on the PC where Avaya IP Office Manager was installed. Select the SIP line of interest from the left pane. On the **Status** tab in the right pane, verify that the **Current State** is *Idle* for each channel (assuming no active calls at present time).

- Select the **Alarms** tab and verify that no alarms are active on the SIP line.

- Verify that a phone connected to PSTN can successfully place a call to the Avaya IP Office with two-way audio.
- Verify that a phone connected to Avaya IP Office can successfully place a call to the PSTN with two-way audio.
- Using a network sniffing tool (e.g., Wireshark), monitor the SIP signaling messages between PaeTec and Avaya IP Office on an outbound call from the enterprise to the PSTN.

8. Conclusion

The PaeTec SIP Trunking service passed compliance testing. These Application Notes describe the procedures required to configure the SIP connection between Avaya IP Office and the PaeTec SIP Trunking service as shown in **Figure 1**.
