

Avaya Solution & Interoperability Test Lab

Application Notes for Datapulse™ Precision 4.2 with Avaya Communication Server 1000E R7.5 - Issue 1.0

Abstract

These Application Notes describe the configuration of Datapulse™ Precision to interoperate with Avaya Communication Sever 1000E.

Information in these Application Notes has been obtained through DevConnect Compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe a compliance tested configuration of the interoperability of Datapulse™ Precision to interoperate with Avaya Communication Server 1000E. Datapulse™ Precision retrieves call detail records (CDR) from the Avaya Communication Server 1000E system.

2. General Test Approach and Test Results

The interoperability compliance test included feature testing. The feature testing evaluated the ability of Datapulse™ Precision to correctly collect and present the generated call data for various scenarios. The Avaya Communication Server 1000E with Datapulse Precision was tested in the Avaya Lab. Test cases were executed jointly by an Avaya and a Datapulse representative. All tests were manual tests and all results were discussed and agreed.

2.1. Interoperability Compliance Testing

Feature functionality testing focused on verifying that Precision could successfully collect, process and present all Communication Server 1000E call data. All tests were manual tests and covered the following areas:

- Precision's three methods of connection to the Communication Server 1000E
 - Direct Serial connection
 - NetBuffer
 - IPBuffer
- Ensured that Internal calls provide CDR data and Precision can process and report correctly for each connection method
- Ensured that Internal calls that include Operator Console 2250 provide CDR data and the data is interpreted correctly by Precision for each connection method
- Ensured that Incoming and Outgoing trunk calls are reported correctly by Precision for each connection method
- Ensured that data for each of the various Deskphone types, IP (UNISTim), SIP and digital sets was properly reported.

2.2. Test Results

All tests that were executed passed successfully except for the following observation.

- An issue with the CDR data that is produced by the Avaya Communication Server 1000E was encountered during testing. Datapulse prepared a patch that can be applied in order to workaround the issue until a fix is available from Avaya. An Avaya tech ticket has been opened to track this issue.
Avaya Support Ticket #10316: CDR output is incorrect due to additional carriage return in the 'Ring Time' CDR data.

2.3. Support

Technical support for the Avaya products can be obtained from Avaya. See the support link at <http://support.avaya.com> for contact information.

Technical support can be obtained for Datapulse Precision from Datapulse. Submit a Support Issue <http://www.datapulse.co.uk/uk/services/submitproblem.aspx> or email Datapulse at support@datapulse.com

3. Reference Configuration

The reference configuration described throughout these Application Notes is shown in **Figure 1**, **Figure 2** and **Figure 3**.

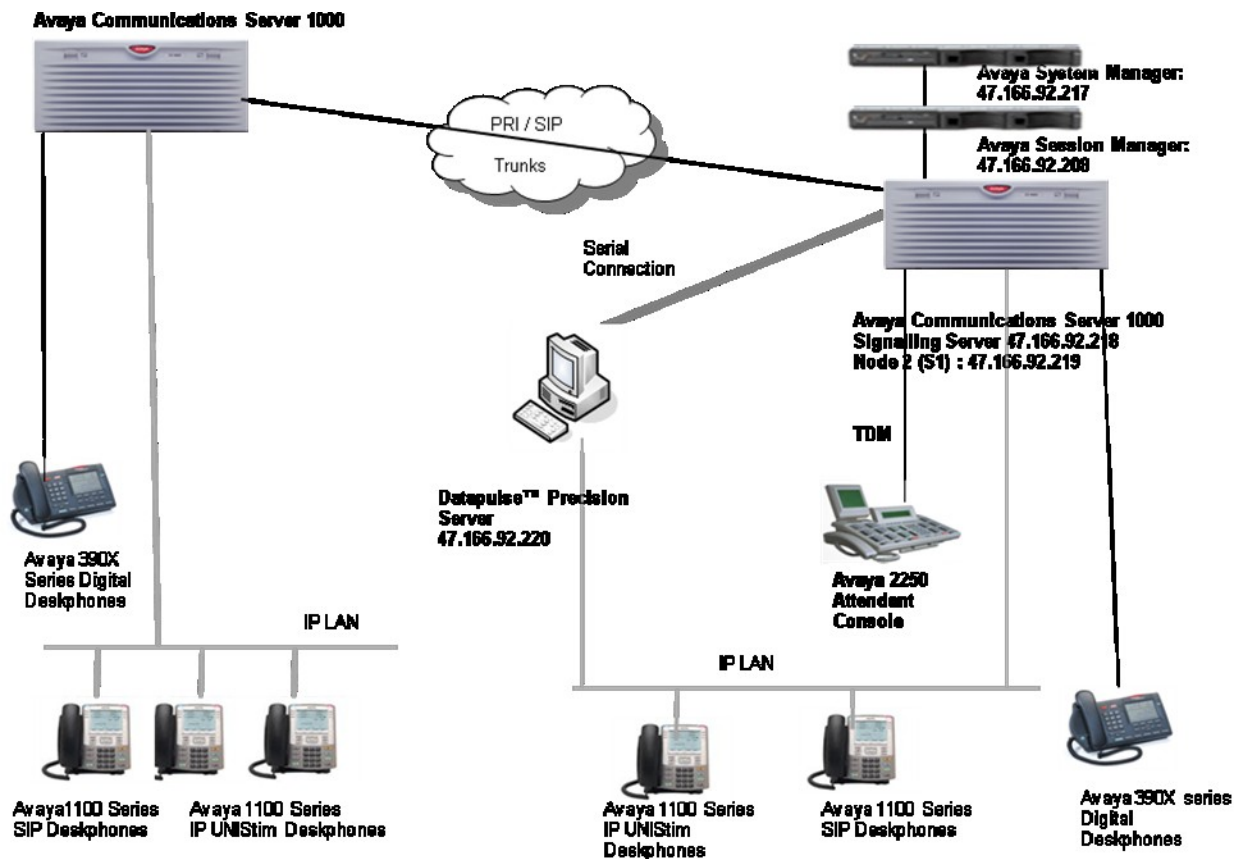

Figure 1: Avaya Communications Server 1000E / Datapulse Precision Direct Serial connection

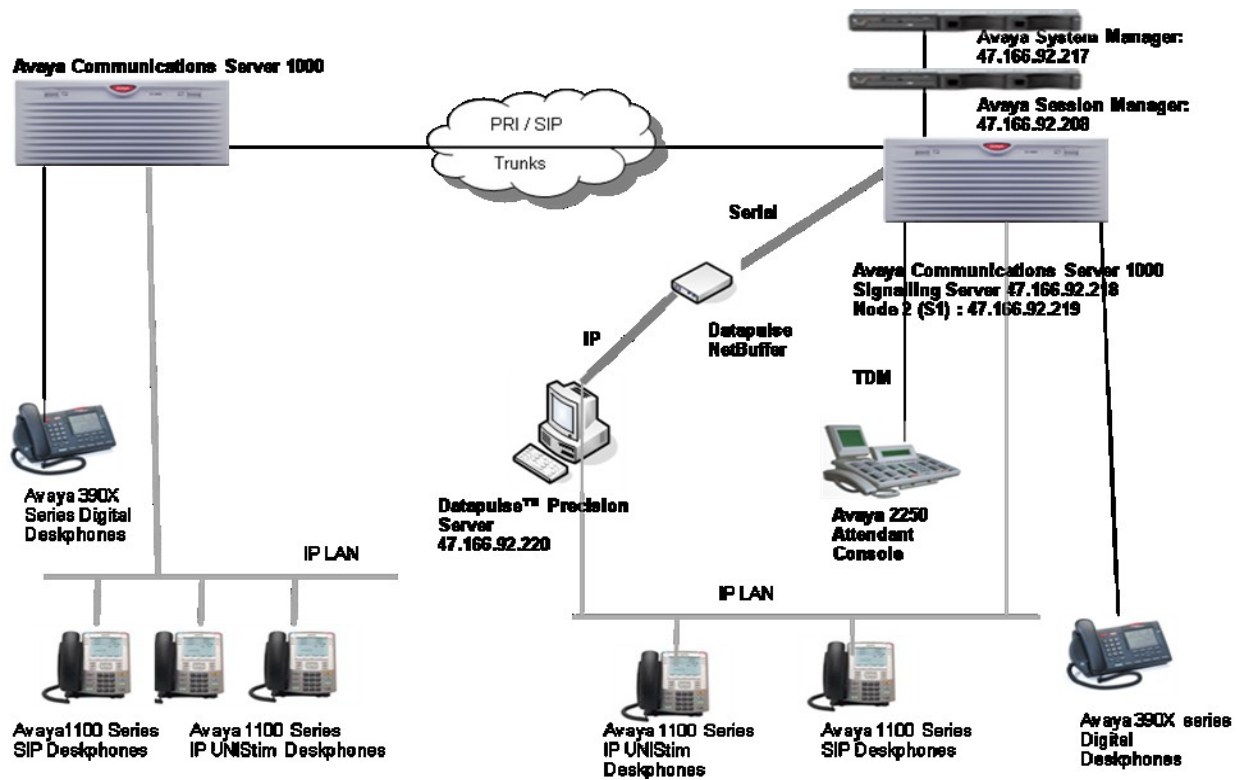

Figure 2: Avaya Communications Server 1000E / Datapulse Precision NetBuffer connection

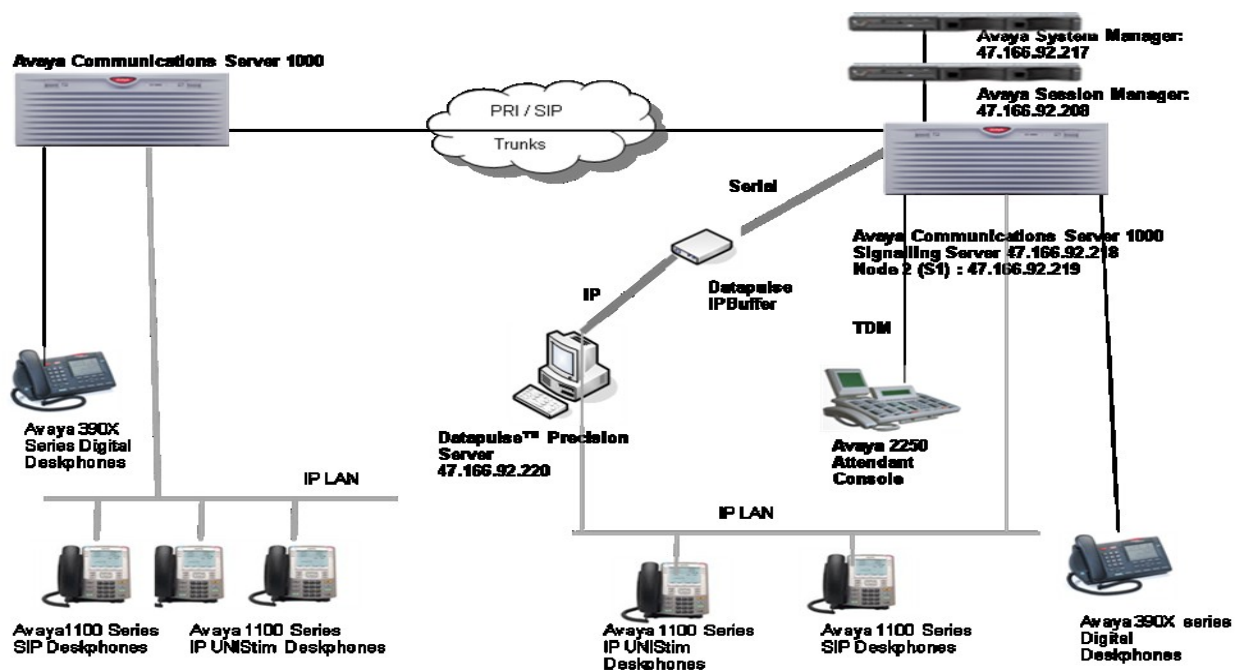

Figure 3: Avaya Communications Server 1000E / Datapulse Precision IPBuffer connection

3.1. Avaya Communication Server 1000E

The Communication Server 1000E runs on the Common Processor Pentium Mobile (CP-PM) server as a co-resident configuration. The patch level installed at the time of testing is listed in the **Appendix**. As the diagram shows, a number of Avaya Deskphones may be configured. Typically, the set-up will have external communication via a SIP or PRI trunks to the PSTN or another Communication Server 1000E as shown in **Figure 1**, **Figure 2** and **Figure 3**.

3.2. Datapulse™ Precision

Precision is a call management system, i.e. a call-billing and costing tool, that provides monitoring and reporting of network traffic on a switch, tracking of lost and abandoned calls and detection of telephone misuse and assists in reducing operating costs. It collects data from the CDR output and processes and costs it according to the selected tariff. Call data can be generated for various calls type and scenarios e.g., intra-switch calls, inbound trunk calls and outbound trunk calls. There are 3 supported configuration options.

- Serial connection – Direct connection to the Communication Server 1000E to collect CDR Data
- NetBuffer – Serial cable is connected to the Buffer, Web interface to Precision server
- IPBuffer - Serial cable is connected to the Buffer, Web interface to Precision server

Note: Scannex NetBuffer and IPBuffer products are supported by Datapulse.

4. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided.

Equipment	Software/Firmware
<i>Avaya PBX Products</i>	
Avaya Communication Server 1000E	Avaya Communication Server 1000E R7.5 Patches on the sysetms are listed in Appendix
Avaya S8800	Avaya Aura® Session Manager R6.1 6.1.00.610023-1
Avaya S8800	Avaya Aura® System Manager R6.1 6.1.0.0.7345-6.1.5.9

<i>Avaya Attendant Products</i>	
Avaya 2250 Attendant Console	ASIP 09 00 UIP0711
Avaya Console Interface Unit – NTAG58AA	Rel:04
<i>Avaya Internal Telephone Sets</i>	
Avaya 1100 series IP Telephones <ul style="list-style-type: none"> • 1140e • 1230e • 1165e Avaya M3900 series Telephones <ul style="list-style-type: none"> • M3904 Avaya 1100 series SIP Telephone <ul style="list-style-type: none"> • 1140 • 1230 	0625C8A (UNISTim 5.0) 062AC8A (UNISTim 5.0) 0626C8A (UNISTim 5.0) Version: AA93 SIP 1140- 4.00.04.00 SIP 12x0 -4.00.04.00
<i>Avaya External Telephone Sets</i>	
Avaya 1100 series IP Telephones <ul style="list-style-type: none"> • 1140e Avaya M3900 series Telephones <ul style="list-style-type: none"> • M3904 	0625C8A (UNISTim 4.2) Version: AA93

Datapulse Products	
Datapulse PC (Direct Connect)	Precision Server Software 4.2.1.6
Scannex NetBuffer (See Note below)	Version 2.63
Scannex IPBuffer (See Note below)	Version IPBCF2-10.71

Notes: Datapulse will support both Scannex NetBuffer and IPBuffer issues with their Precision product.

5. Configure Avaya Communication Server 1000E

This section provides the procedures for configuring CDR features in the Communication Server 1000E system. For all other provisioning information such as initial installation and configuration, please refer to the product documentation. The Communication Server 1000E system is configured to generate CDR to the serial port.

- Configure CDR in the Customer Data Block
- Configure CDR in the Route Data Block
- Configure CDR for Avaya proprietary phones

5.1. Configure CDR in the Configuration Data Block

A number of configuration changes are required on the Communication Server 1000E Configuration Data Block.

Note: Not all of the following prompts need an answer. Only answers in bold characters are mandatory for a basic configuration. Accept the default responses for each prompt by pressing the **Return** key except for those that are highlighted in **bold**.

Notes: The configuration and verification operations illustrated in these sub-sections were all performed using terminal access over a serial link into a TTY port using the program “Reflections”. The information provided in these sections describes the configuration for this solution.

5.1.1. Direct the Call Data to the Avaya Communication Server 1000E Serial Port

To direct the call data to the required serial port the following configuration changes are required:

LD 17	
REQ CHG	Change
TYPE ADAN	Action Device And Number
ADAN NEW TTY 12	New Teletype port number. (any number)
CTYP MGC	Media Gateway
IPMG 4 0	IP Media Gateway - The IPMG on which the TTY is being configured. 4 = Superloop, 0= Shelf
PORT 0	Port Number for TTY. (0-4)
DNUM	
DES CDR-PORT	Designator, can be any name
BPS	
BITL	
STOP	
PARY	
FLOW	
USER CTY	CDR TTY - The TTY port only outputs CDR records
TTYLOG	
BANR	

5.1.2. Configure CDR in the Configuration Record

To change the format of the Call Records make the following change on the Communication Server 1000E.

LD 17	
REQ CHG	
TYPE PARM	Change System Parameters
...	
FCDR NEW	Utilises 'NEW' CDR format. Information field locations are fixed. Requires package 234
PCDR	
TPO	
...	
SBA_ADM_INS	
SBA_USER	
CLID YES	Calling Line ID included in CDR records

5.1.3. Configure CDR in the Customer Data Block

There are a number of call types to be enabled in the Customer Data Block.

LD 15	
REQ: CHG	
TYPE: CDR	Change the Call Detail Records
TYPE CDR_DATA	
CUST 0	
CDR YES	Yes to change CDR
IMPH YES	CDR enabled for incoming calls
OMPH YES	CDR enabled for outgoing calls
AXID YES	Auxiliary Identification provide the TN when the call involves a multiple appearance DN
TRCR YES	Carriage Return sent after each CDR message
CDPR	
ECDR YES	Send End-to-End Signalling digits in CDR format
BDI	
OTCR	
PORT 12	Enter the port number that was configured in Section 5.1.1
CNI	
BCAP	
CHLN	
FCAF	

5.1.4. Enable Time to answer Customer Data Block

Enter overlay 15 (LD 15) to enable time to answer information and abandoned call records to be displayed in the CDR record.

LD 15	
REQ CHG	
TYPE: CDB	Change the Customer Data Block
OPT TTAA	Time to Answer information and Abandoned call records allowed

5.2. Configure CDR in the Route Data Block

Enable CDR records to be transferred from Inter-switch trunks.

```
LD 16
REQ  CHG
TYPE  RDB
CUST  0
ROUT  14
DES
TKTP
M911P
...
CNTL
DRNG
CDR  YES
      INC  YES      Yes to change CDR
      LAST YES      CDR enabled for all incoming calls
      QREC YES      The terminating ID field in the CDR record will contain
                    the last party.
      OAL  YES      Initial connection (Q) record will be output for incoming
      TTA  YES      calls.
      ABAN YES      Time to Answer output
      AIA  YES      Abandoned call records output
      OAN  YES
      OPD  YES
NDP
NATL
DNIS  YES
...
CCBA
ARDN
```

5.3. Configure CDR for Avaya Deskphones

CDR is enabled on individual phonesets in LD11 or LD20.

```
LD 20
REQ:  CHG
TYPE: 1140
TN    96 0 0 20
ECHG  YES
ITEM  CLS ABDA ICDA CDMA
      Class of Service to be applied to the phoneset
      ABDA - Abandoned call record and time to answer allowed
      ICDA - Internal Call Detail Recording Allowed
      CDMA - allows external station activity records to be
            generated for the set.
      Note: The phoneset will output D records whenever a trunk
            is accessed by, or terminates on, the phone. The D
            record is output regardless of the CDR settings in
            the Route Data Block (LD 16).
```

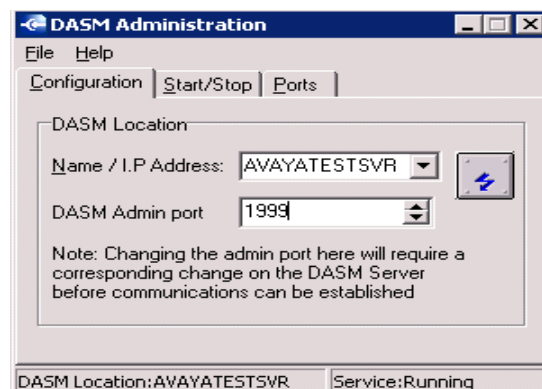

6. Configure Datapulse™ Precision

In order to configure Precision it is necessary to configure data collection ports. This can be done using the **Data Acquisition and Storage Module (DASM)**. Ports are the means of collecting data from the Communication Server 1000E. DASM listens for data on these ports and, when it arrives, moves the data into a stream file for processing.

- Configure TCP/IP data collection ports
- Configure COM Serial port as the data collection port
- Define Communication Server 1000E Switch Configuration for Precision
- Configure Scannex NetBuffer
- Configure Scannex IP Buffer

6.1. Configure Data Ports using Data Acquisition and Storage Module

DASM Administration is run on the Precision Server from **Start → Datapulse → DASM → DASM Administration**. The **DASM Administration** window appears.

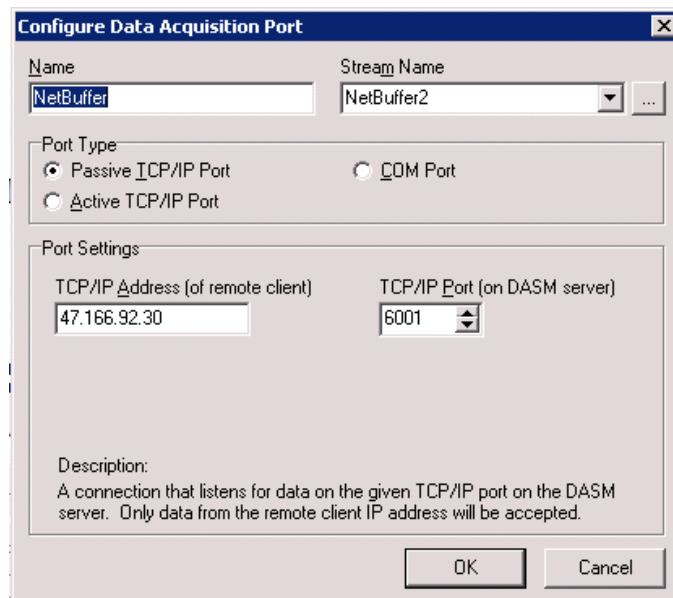

Enter the the **Name** or **IP Address** of Precision Server in the **Data Acquisition and Storage Module**. Enter 1999 in the **DASM Admin port** field as shown. Click on **Ports** tab to reveal the ports configuration window.

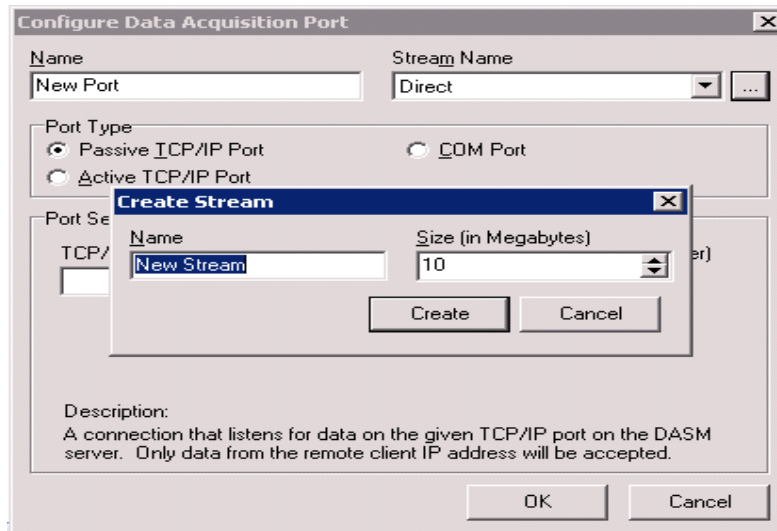

Ports can be configured as **COM** or **TCP/IP**. A COM port is a direct serial connection into the PC which the DASM service monitors for data, whereas a TCP/IP port is a TCP port that the DASM service listens on for data. If using a **NetBuffer** or **IPBuffer**, a **TCP/IP** port is used. TCP/IP ports can be passive or active. For Communication Server 1000E in combination with NetBuffers and IPBuffers, the passive option is used.

6.1.1. Configure Data Port as a TCP/IP Port

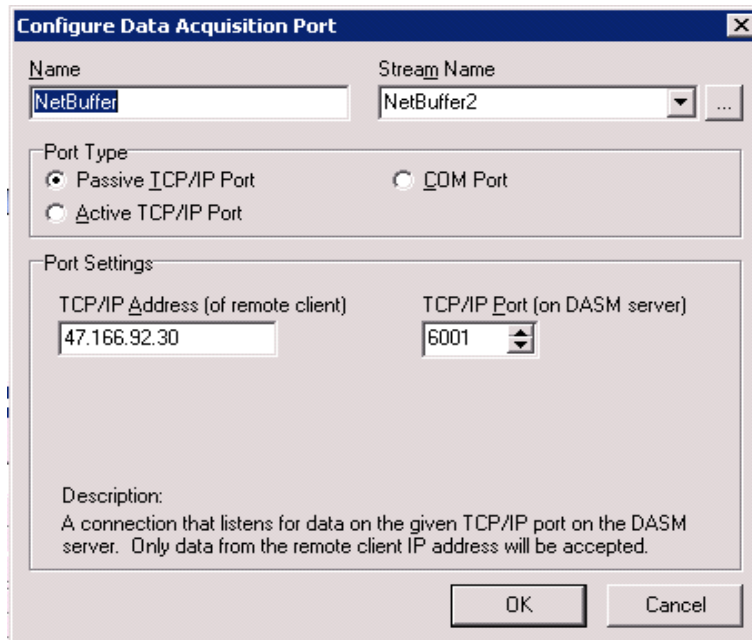

Click **Add...** to add a new port. The **Configure Data Acquisition Port** window appears.

In the **Name** field enter any name to identify the port. In this case 2 TCP/IP ports were configured one for use of NetBuffer and one for use of IPBuffer so **NetBuffer** and **IpBuffer** were used for the port names. Click ... ellipsis button to the right of the **Stream Name** field. A new window called **Create Stream** appears.

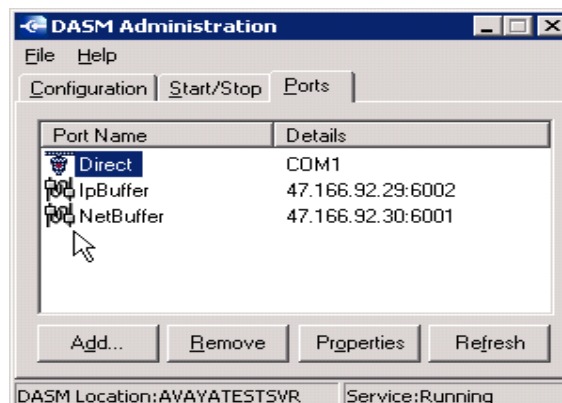

Enter any name in the **Name** field, the **Size (in Megabytes)** field can be left as default **10**. A stream is a circular file into which DASM feeds the data received on its ports. It uses one stream per port. The data is inserted into the stream by DASM as and when it receives it. Once the stream is full, it deletes the oldest data and inserts the newest, hence it being called a circular file. Click on the **Create** button. The previous window **Configure Data Acquisition Port** appears again for continuation of the port configuration. Select **Passive TCP/IP Port**.

The dialog box titled "Configure Data Acquisition Port" contains the following fields and options:

- Name:** NetBuffer
- Stream Name:** NetBuffer2
- Port Type:**
 - ☒ Passive TCP/IP Port
 - ☐ COM Port
 - ☐ Active TCP/IP Port
- Port Settings:**
 - TCP/IP Address (of remote client):** 47.166.92.30
 - TCP/IP Port (on DASM server):** 6001
- Description:** A connection that listens for data on the given TCP/IP port on the DASM server. Only data from the remote client IP address will be accepted.
- Buttons:** OK, Cancel

In **TCP/IP Address (of remote client)** enter the stream **IP address** of the remote device which will be pushing the data to the Precision server (i.e. NetBuffer or IPBuffer). In this case 47.166.92.29 and 47.166.92.30 were used for the two buffers. Use the default port **6000** in the **TCP/IP Port (on DASM Server)** for the first port setting and port **6001** for the second. Click Ok to return to the DASM Administration window.

The DASM Administration window shows the following configuration:

Port Name	Details
Direct	COM1
IpBuffer	47.166.92.29:6002
NetBuffer	47.166.92.30:6001

Buttons: Add..., Remove, Properties, Refresh

Status: DASM Location: AVAYATESTSVR Service: Running

The serial cable from the Communication Server 1000E should be plugged into one of the serial ports in the IPBuffer or in the case of the NetBuffer there is only one serial port to connect to.

6.1.2. Configure Com1 as a Serial Data Collection Port

When configuring a com port to receive data on, this requires a port number. This corresponds to the physical com port on the Precision server. PCs rarely have more than 1 or 2 com ports on them and these are usually labelled as com1 and com2 and recognised in the OS as the same. So, if input data is required on com1 then configure DASM to use Port Number 1. The serial cable from the Communication Server 1000E should be plugged into this com port on the Precision server.

Configure Data Acquisition Port

Name:

Stream Name: ...

Port Type:

- ☐ Passive TCP/IP Port
- ☒ COM Port
- ☐ Active TCP/IP Port

Port Settings:

Port Number:

Flow Control:

Port Settings: ...

☐ DTR Enabled

Description:
A connection that listens for data on a serial port on the DASM server.

OK Cancel

In the **Name** field enter any suitable name to identify the port e.g., **Direct**. Click ... ellipsis button to the right of the **Stream Name** field. A new window called **Create Stream** appears.

Configure Data Acquisition Port

Name:

Stream Name: ...

Port Type:

- ☒ Passive TCP/IP Port
- ☐ COM Port
- ☐ Active TCP/IP Port

Port Settings:

TCP/

Create Stream

Name:

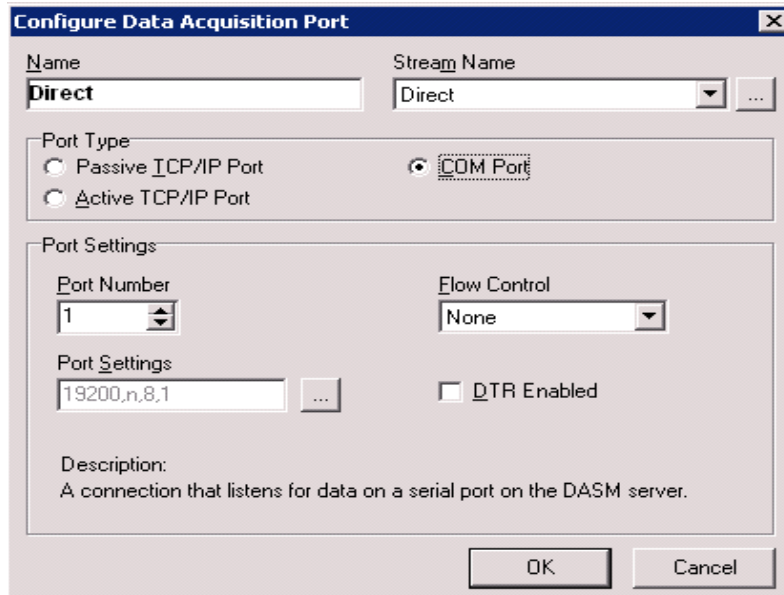

Size (in Megabytes):

Create Cancel

Description:
A connection that listens for data on the given TCP/IP port on the DASM server. Only data from the remote client IP address will be accepted.

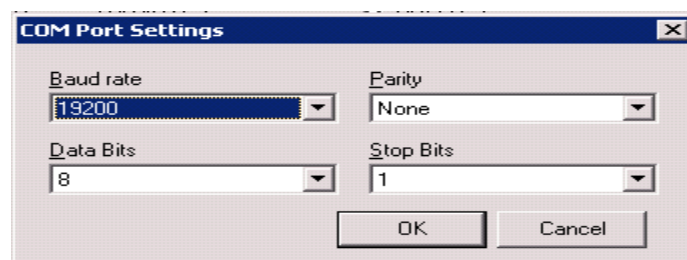

OK Cancel

Enter any name in the **Name** field identify the stream e.g., **Direct**, the **Size (inMegabytes)** field can be left as default **10**. Click on the **Create** button. The previous window **Configure Data Acquisition Port** is presented.

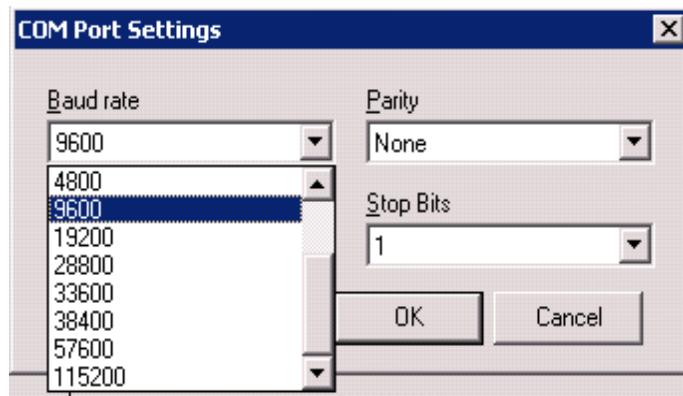

The 'Configure Data Acquisition Port' dialog box has a title bar with a close button. It contains two text fields: 'Name' with the value 'Direct' and 'Stream Name' with a dropdown menu showing 'Direct' and an ellipsis button. Below these is a 'Port Type' section with two radio buttons: 'Passive TCP/IP Port' (unselected) and 'COM Port' (selected). The 'Port Settings' section includes a 'Port Number' spinner set to '1', a 'Flow Control' dropdown set to 'None', a 'Port Settings' text field containing '19200,n,8,1' with an ellipsis button, and a checkbox for 'DTR Enabled' which is unchecked. A 'Description' label is followed by the text 'A connection that listens for data on a serial port on the DASM server.' At the bottom are 'OK' and 'Cancel' buttons.

The previous window **Configure Data Acquisition Port** appears again for continuation of the port configuration. Select **COM Port** as shown. The COM port settings should be set to match those that were configured on the CDR port on the Communication Server 1000E. See **Section 4.1.1** So if the port settings on the Communication Server 1000E are 9600, None, 8 and 1, then make the DASM port match. Click the ... ellipsis. The **COM Port Settings** window is presented.

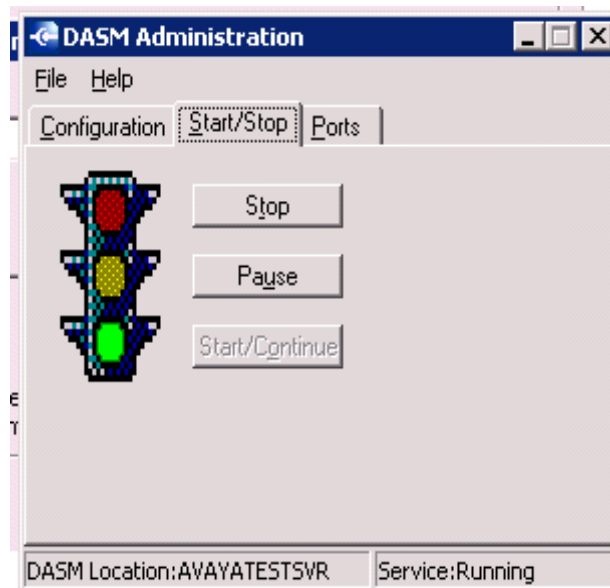

The 'COM Port Settings' dialog box has a title bar with a close button. It contains four dropdown menus: 'Baud rate' set to '19200', 'Parity' set to 'None', 'Data Bits' set to '8', and 'Stop Bits' set to '1'. At the bottom are 'OK' and 'Cancel' buttons.

Enter the settings to match the Communication Server 1000E settings and click **OK**.

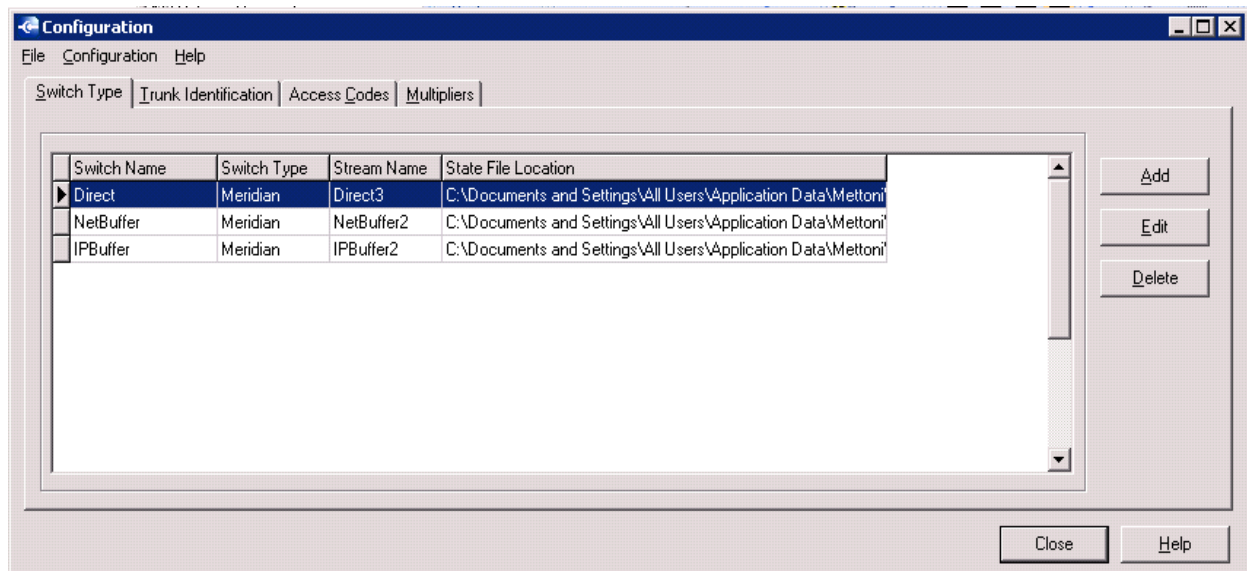

The DASM service must be restarted once the ports and streams are created. The easiest way to do this is via the **Stop** and **Start** buttons on the **Start/Stop** tab on **DASM Administration** window.

6.1.3. Define Avaya Communication Server 1000E Switch Configuration for Precision

Once the DASM ports and streams are created, Precision needs to be defined to the Communication Server 1000E to be defined. The switch is effectively a one-to-one mapping from the Communication Server 1000E to the Precision database via the DASM port and stream. The switch is configured in the Precision Configuration tool. Go to **Start → Datapulse → Precision CPE → Configuration**. The following window appears. On the **Switch Type** tab click the **Add** button on the right hand side.

The **Edit Switch** window appears.

- **Switch name** – any suitable name. For convenience the port names that were configured in **Section 5.1.1** or **Section 5.1.2** should be used.
- **Stream Name** -i.e. the stream that is being used to contain data from the CS1000E. This needs to have been already set up via DASM. See **Section 5.1.1** or **Section 5.1.2** depending on whether TCP/IP port or Serial Port is being used.
- **Switch type** - this is always 'Meridian' for Communication Server 1000E (Meridian being the precursor for Communication Server 1000).

Switch name: Direct

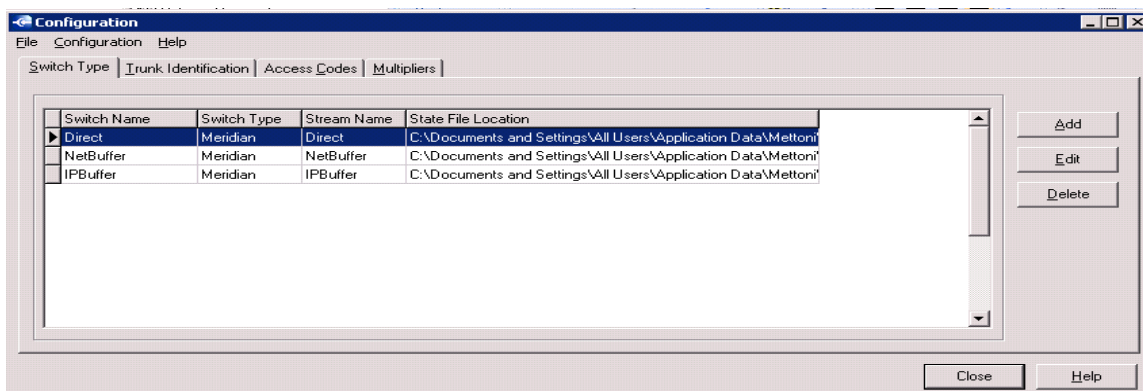

Switch type: Meridian

Stream name: Direct

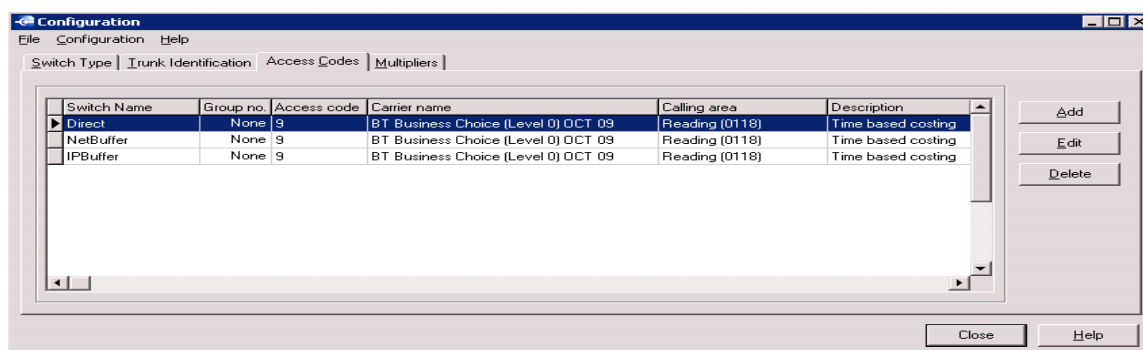

OK Cancel Help

Click the **OK** button to exit this window.

The **Configuration** window reappears.

Any access codes that will be used on the Communication Server 1000E need to be added on the **Access Codes** Tab. This is so that Precision can strip off the access code to obtain the actual number dialled in order to cost the call and report on locations dialled, etc. Click **Add** or **Edit** buttons on the **Access Codes** tab as required.

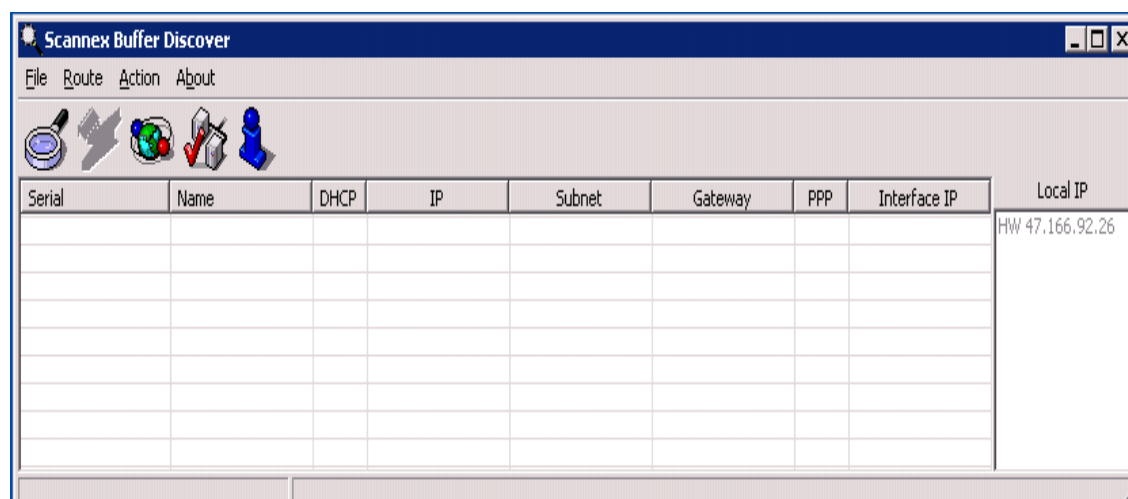

The access code also stores information on the tariff used and the location from which the calls are being made in order to calculate the cost of calls. The tariffs are installed via the Tariff Manager utility. This configuration is not in the scope of these Application Notes.

6.2. Configure Scannex NetBuffer

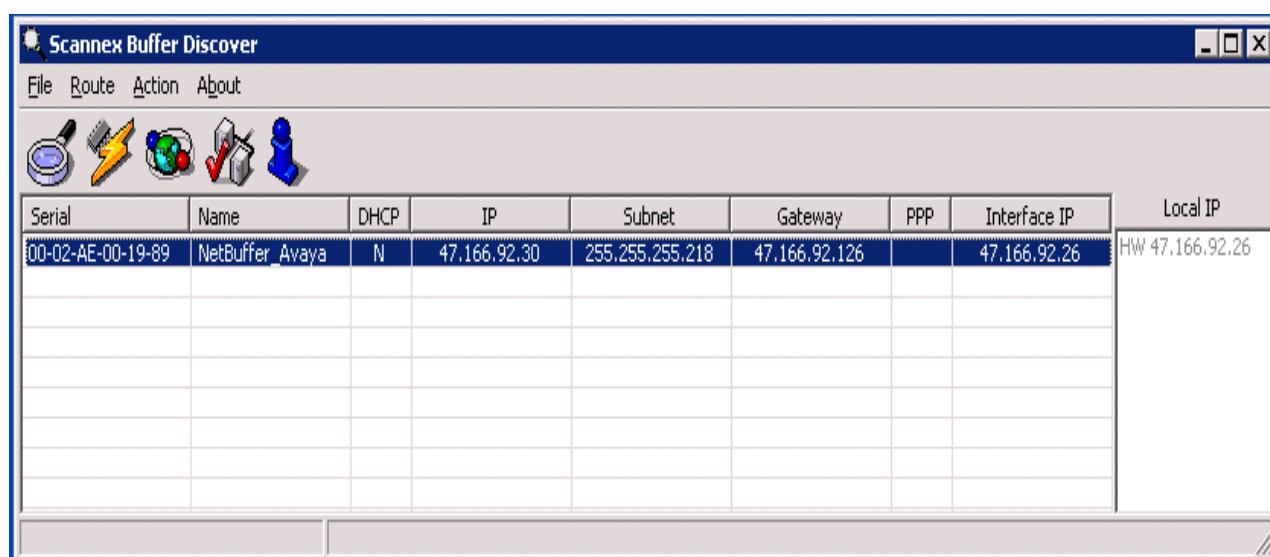

Run SEDiscover. Go to **Start → All Programs → Scannex → SEDiscover → SEDiscover**.

The **Scannex Buffer Discover** window appears.

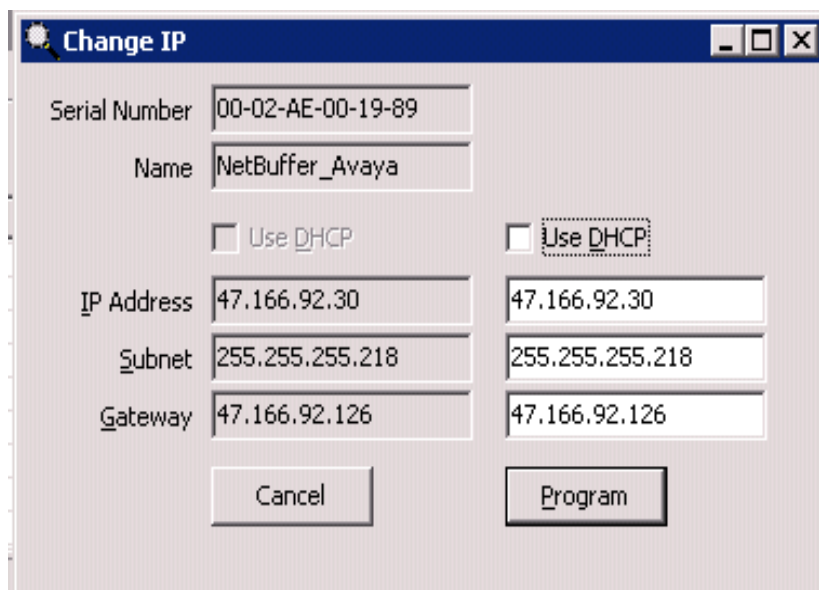

To find a NetBuffer on the network, click the **magnifying glass** icon.

When the NetBuffer is identified select it and click **lightning** icon to configure IP settings.

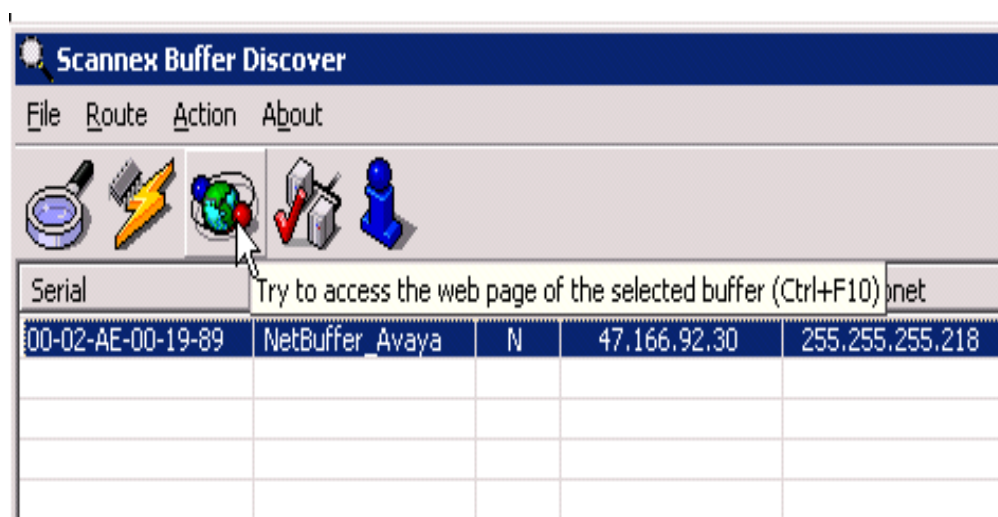

The **Change IP** window appears. Enter the IP configuration to be assigned to the NetBuffer. Click **Program** when complete to save the settings and to return to the previous window.

The 'Change IP' dialog box contains the following fields and controls:

- Serial Number:** 00-02-AE-00-19-89
- Name:** NetBuffer_Avaya
- Use DHCP:** Two checkboxes, both are unchecked.
- IP Address:** 47.166.92.30
- Subnet:** 255.255.255.218
- Gateway:** 47.166.92.126
- Buttons:** Cancel and Program

To access admin utility click on the acces button as shown.

The following window should appear in your web browser. Click on **Setup Menu**.

[\[Status/Index\]](#) [\[Lock\]](#) [\[Engineer Menu\]](#) [\[Setup Menu\]](#)

Version 2006-Nov-22 2.63, built 2004-11-27 22:37

scannex III

The **Operating Mode** page appears. Select **Serial → TCP2** from the drop down list next to **Data Transfer** to correspond to the physical port that is used to connect to the Communication Server 1000E. In the **TCP2 IP+port** field enter the **IP Address** of the Precision server and the **port** number that was configured for the NetBuffer in **Section 5.1.1**. All other setting remains at their default values. Click **Save**.

The screenshot shows a web browser window titled "NetBuffer_Avaya" 00-19-89 - Windows Internet Explorer. The address bar shows "http://47.166.92.30/mode". The browser has a menu bar with File, Edit, View, Favorites, Tools, and Help. Below the menu bar is a Favorites bar with a star icon and the text "NetBuffer_Avaya" 00-19-89. The main content area has a header with links: [Status/Index] [Lock] [Engineer Menu] [Setup Menu]. Below this is a section titled "Operating Mode".

Data Transfer is set to "Serial -> TCP2". A green note says "Left side has the buffer".

Data pause is set to "0". A green note says "x 50ms. 0=off".

Source has two radio buttons: "Input & Output" (selected) and "Input only".

Data has two radio buttons: "ASCII" (selected) and "Binary". A green note says "ASCII strips D7".

ASCII has two radio buttons: "Text only" (selected) and "All". A green note says "(when ASCII)".

Memory has two radio buttons: "Linear" (selected) and "Circular". A green note says "Default=Circular".

IP settings

TCP1 IP+port is set to " :0". A green note says "Active=name/ ipaddress. Listen=blank/ #name/ #ipaddress".

TCP2 IP+port is set to "47.166.92.26 :6001". A green note says "Port=0 disables".

Live UDP output is set to " :0". A green note says "Port=0 for no live output".

Serial port settings

RX/TX is set to "Auto". A green note says "Default=Auto".

Baud rate is set to "9600". A green note says "bits per second".

Protocol is set to "8 None". A green note says "data length and parity".

Autobaud has two radio buttons: "Enabled" (selected) and "Disabled". A green note says "Default=Enabled".

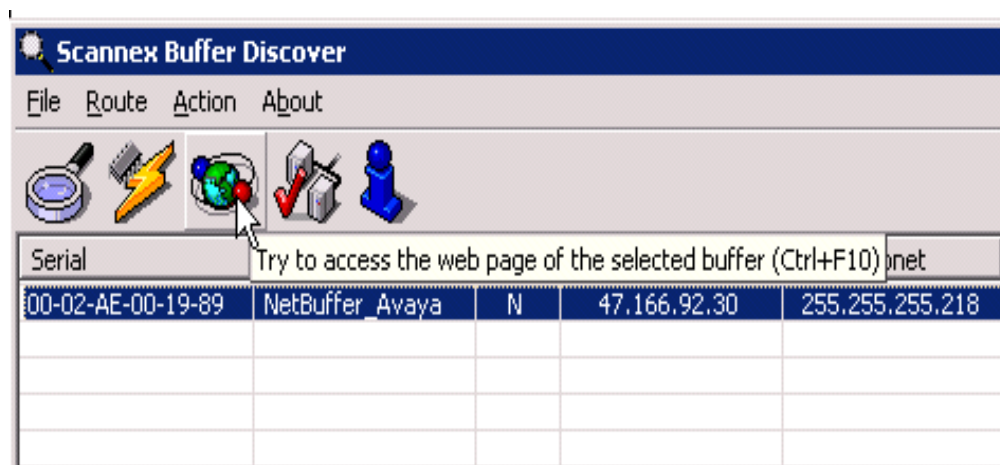

There are "Save" and "Cancel" buttons at the bottom.

Version 2006-Nov-22 2.63, built 2004-11-27 22:37

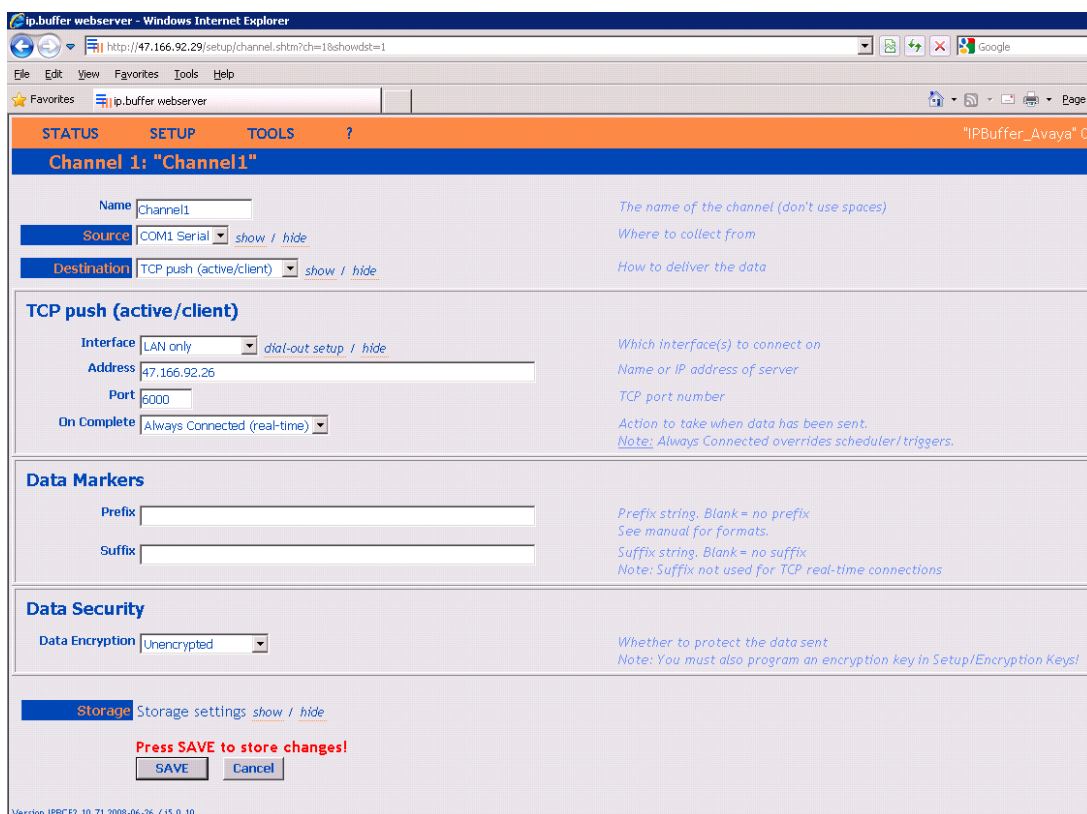

scannex III

6.3. Configure Scannex IPBuffer

Use SEDiscover to detect and connect to the IPBuffer in the way as was done for the NetBuffer in the previous section. To access admin utility click on the acces button as shown.

The Source page in IPBuffer admin utility is presented. Enter **Name** and **COM1** serial in the **Source** field and **TCP push (active/client)** in the **Destination**. Enter the **IP address** of the Precision server in the **Address** field. Click **SAVE** to store the changes as shown.

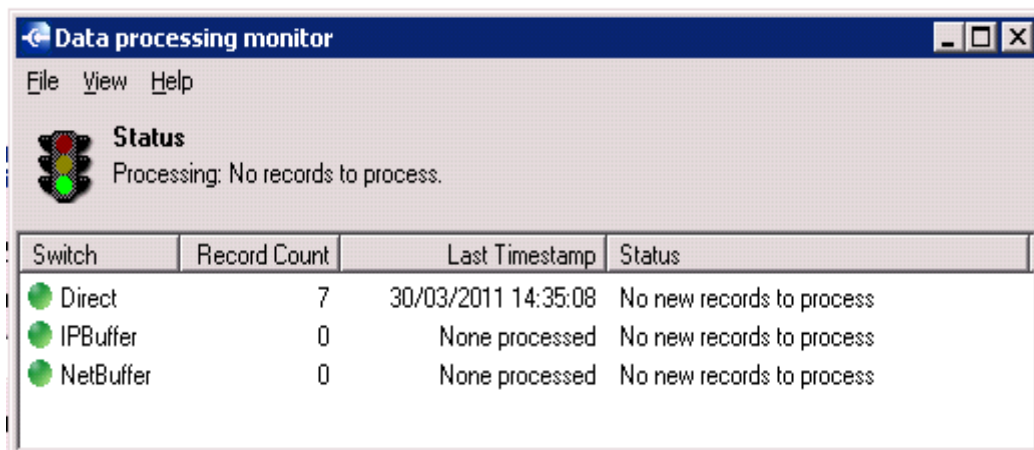

7. Verification Steps

The following check can be carried out to ensure correct configuration and status of Precision.

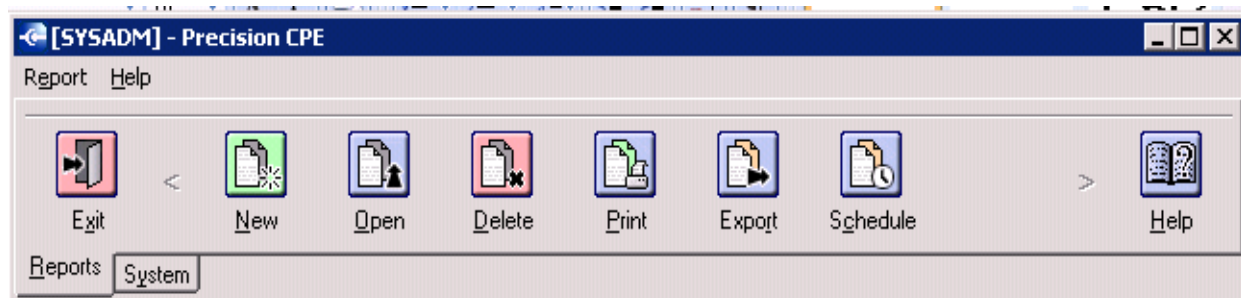

7.1. Verify Precision Status

Go to **Start → Datapulse → Precision CPE → Data Processing Monitor**. The following window appears showing the status of the system, i.e., whether the data processing service is running OK, that the DASM ports and streams are ready and whether or not they are or have received any data.

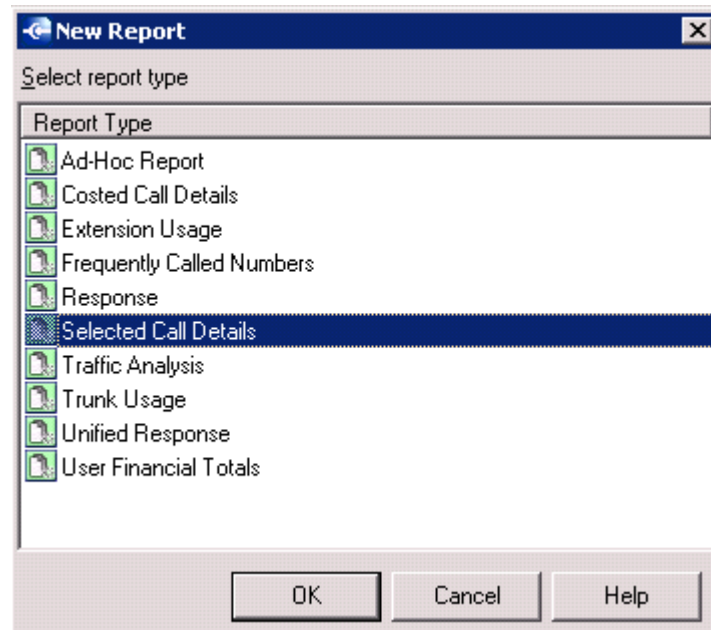

7.2. Verify Data Collection

Go to **Start → Datapulse → Precision CPE → Reporting**. The [SYSADM] – Precision CPE window is displayed. This allows the user to create several different types of reports, to view them or print, export or email them.

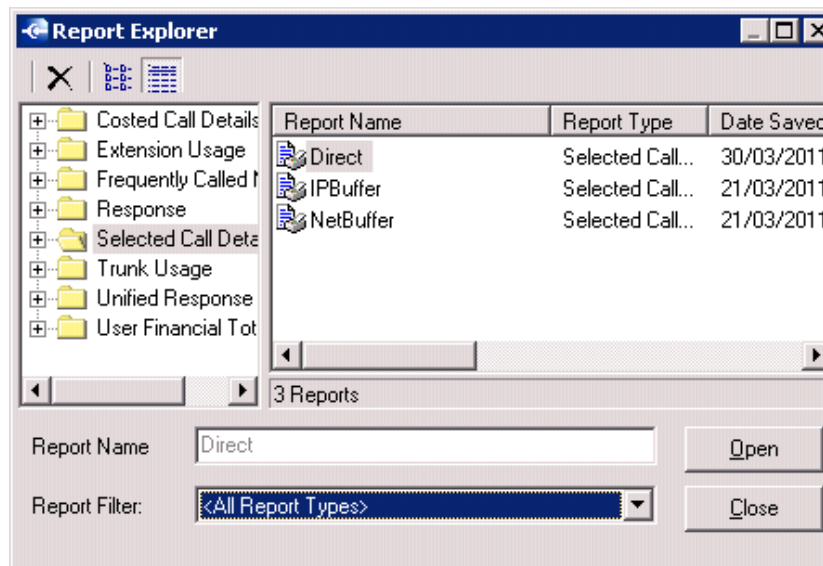

The most basic report for viewing call data is the Selected Call Details report. This allows the user to look at the basic data without it having been manipulated in any way.

Click on the **New** button to create a new report. The **New Report** window appears and requires selection of a report type.

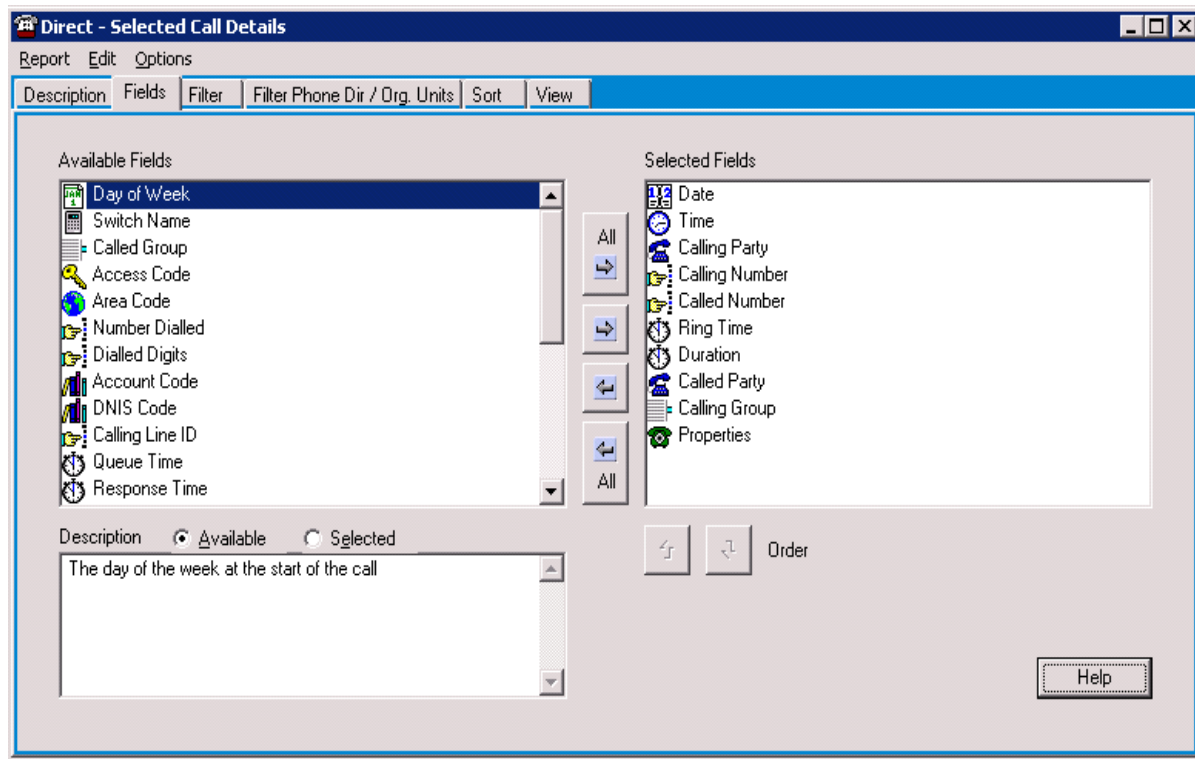

Highlight **Selected Call Details** from the **Report Type** listing and click **OK**.

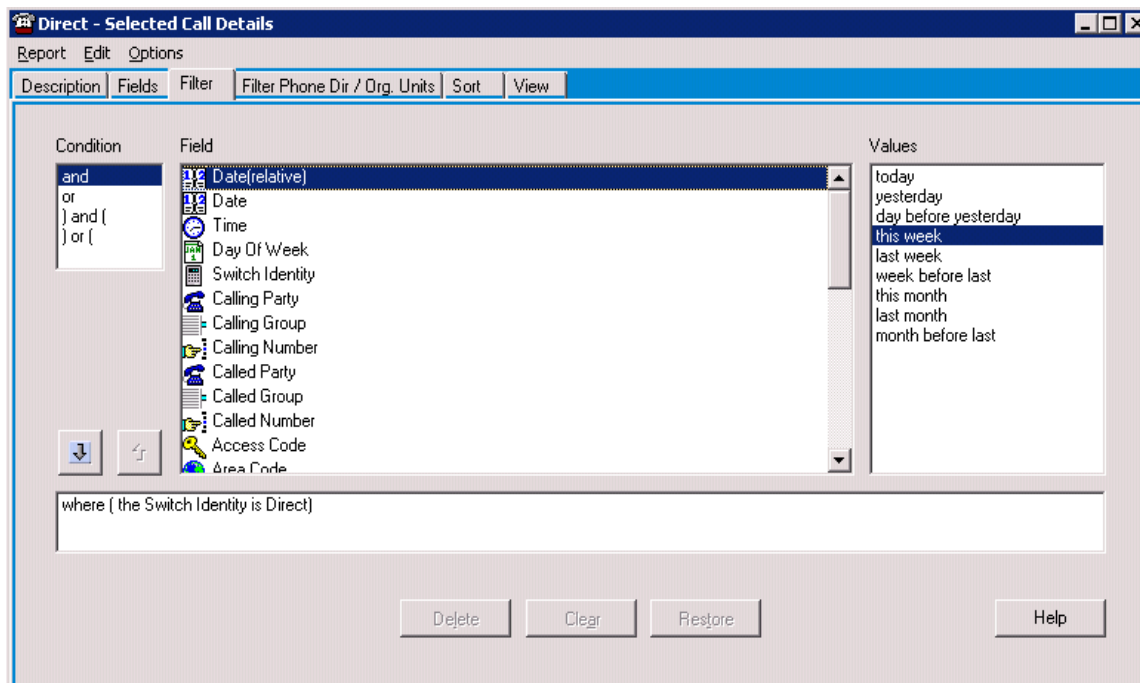

Enter a **Report Name** or select an existing report. Click **Open**.

Taking the **Selected Call Details** report as an example, the fields to be shown in a report can be selected from **Available Fields** and moved to **Selected Fields**.

The data can be filtered and / or sorted electing the appropriate tabs.

The data is then displayed according to the selected fields, filters and sort.

8. Conclusion

These Application Notes describe the configuration steps required to successfully integrate the Datapulse™ Precision 4.2 application software with Avaya Communication Server 1000E R7.5. All feature tests that were carried out indicate successful interoperability between the two products.
