

Avaya Solution & Interoperability Test Lab

Application Notes for the CTI Data Solutions Proteus Office 5.0 with Avaya Communication Manager - Issue 1.0

Abstract

These Application Notes describe the configuration steps required for the CTI Data Solutions Proteus Office 5.0 to successfully interoperate with Avaya Communication Manager. Features and functionality were validated and performance testing was conducted in order to verify operation under load.

The Proteus Office is a telephone call management and reporting application. The Proteus Office provides information about call detail records through a range of reports that can be printed, or saved to a number of popular file formats for further analysis.

Information in these Application Notes has been obtained through interoperability compliance testing and additional technical discussions. Testing was conducted via the *DeveloperConnection* Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe a compliance-tested configuration utilizing Avaya Communication Manager 3.0 and CTI Data Solutions Proteus Office 5.0.

Proteus Office is a telephone call management and reporting application. Proteus Office comprises three principal parts:

- The Switch Interface is used to collect Avaya Communication Manager specific call information and translate the information into the standard Proteus call record format.
- The Costing Engine receives data from the Switch Interface and writes the data to the calls database.
- The Proteus Office Main User Interface displays a user-selectable real-time call summary. The Main User Interface is also used to set up information about the telephone system, company organisation and reports.

The Proteus switch interface program connects to Avaya Communication Manager over the local or wide area network using TCP/IP and runs in a passive server mode. Avaya Communication Manager is set up to output Call Detail Records (CDRs) to the Proteus server on a specified port.

The Costing Engine processes the call records received in the 'call queue' database and writes the records to the Proteus calls database. Call processing involves applying the correct tariff rates and costing the calls (where appropriate, for example outgoing calls).

Proteus Office provides information about telephone usage through a range of reports that can be printed, or saved to a number of popular file formats for further analysis.

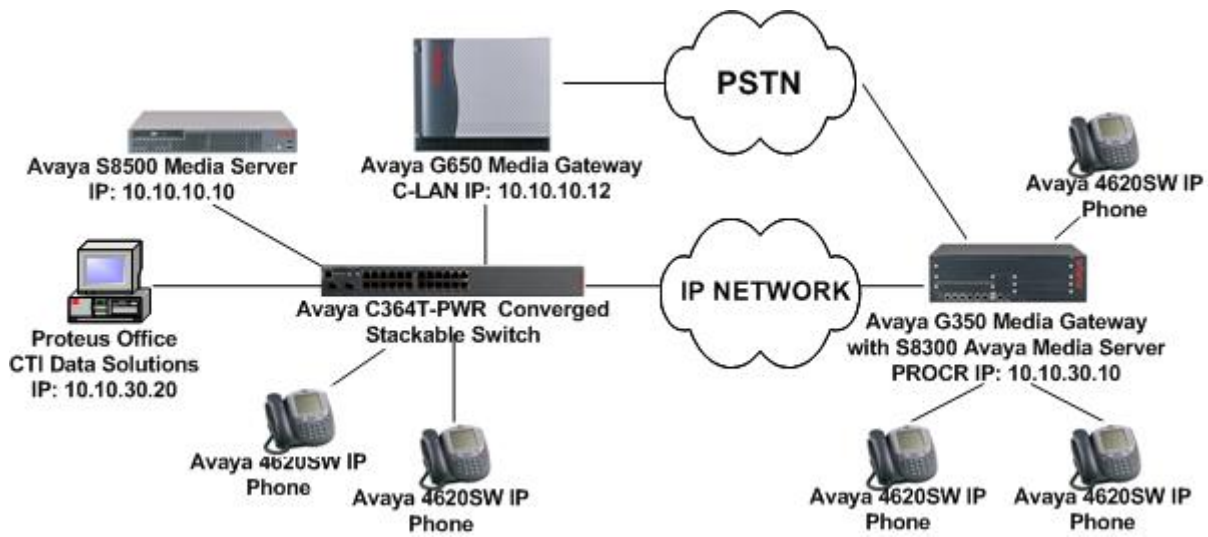

Figure 1: Avaya Communication Manager and CTI Data Solutions Proteus Office Compliance Test Configuration

2. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

Equipment	Software
Avaya Communication Manager	340.3
Avaya 4620 IP Telephones	1.9.1
Avaya C364T-PWR Converged Stackable Switch	4.3.12
CTI Data Solutions Proteus Office	5.0

3. Configure the Avaya Communication Manager

This section describes the steps for configuring CDR links, CDR system parameters, and intra-switch CDR extensions on Avaya Communication Manager. The steps are performed through the System Access Terminal (SAT) interface. The steps are applicable to both Avaya Media Servers in the sample configuration of **Figure 1**; some minor differences are noted where helpful.

Step	Description																																																																									
1.	<p>Enter the change node-names ip command.</p> <p>For the S8500, specify node names and IP addresses for the C-LAN board and Proteus Office (CDR Server).</p> <pre>change node-names ip</pre> <p style="text-align: right;">Page 1 of 1</p> <table border="1"> <thead> <tr> <th colspan="4">IP NODE NAMES</th> </tr> <tr> <th>Name</th> <th colspan="2">IP Address</th> <th>Name</th> <th>IP Address</th> </tr> </thead> <tbody> <tr> <td>CDR_Server</td> <td>10</td> <td>.10</td> <td>.30</td> <td>.20</td> </tr> <tr> <td>G350</td> <td>10</td> <td>.10</td> <td>.30</td> <td>.10</td> </tr> <tr> <td>VAL</td> <td>10</td> <td>.10</td> <td>.10</td> <td>.14</td> </tr> <tr> <td>clan</td> <td>10</td> <td>.10</td> <td>.10</td> <td>.12</td> </tr> <tr> <td>default</td> <td>0</td> <td>.0</td> <td>.0</td> <td>.0</td> </tr> <tr> <td>medpro</td> <td>10</td> <td>.10</td> <td>.10</td> <td>.13</td> </tr> <tr> <td>procr</td> <td>10</td> <td>.10</td> <td>.10</td> <td>.10</td> </tr> </tbody> </table> <p>(8 of 8 administered node-names were displayed) Use 'list node-names' command to see all the administered node-names Use 'change node-names ip xxx' to change a node-name 'xxx' or add a node-name</p> <p>For the S8300, specify a node name and IP address for the Proteus Office. The node name and IP address for procr (the S8300 Media Server Processor Ethernet) are automatically set when the S8300 is configured with an IP address.</p> <pre>change node-names ip</pre> <p style="text-align: right;">Page 1 of 1</p> <table border="1"> <thead> <tr> <th colspan="4">IP NODE NAMES</th> </tr> <tr> <th>Name</th> <th colspan="2">IP Address</th> <th>Name</th> <th>IP Address</th> </tr> </thead> <tbody> <tr> <td>CDR_Server</td> <td>10</td> <td>.10</td> <td>.30</td> <td>.20</td> </tr> <tr> <td>clan</td> <td>10</td> <td>.10</td> <td>.10</td> <td>.12</td> </tr> <tr> <td>default</td> <td>0</td> <td>.0</td> <td>.0</td> <td>.0</td> </tr> <tr> <td>procr</td> <td>10</td> <td>.10</td> <td>.30</td> <td>.10</td> </tr> </tbody> </table> <p>(5 of 5 administered node-names were displayed) Use 'list node-names' command to see all the administered node-names Use 'change node-names ip xxx' to change a node-name 'xxx' or add a node-name</p> <p>The node names configured above will be used in the ip-services form to specify the local and remote nodes of the CDR links.</p>	IP NODE NAMES				Name	IP Address		Name	IP Address	CDR_Server	10	.10	.30	.20	G350	10	.10	.30	.10	VAL	10	.10	.10	.14	clan	10	.10	.10	.12	default	0	.0	.0	.0	medpro	10	.10	.10	.13	procr	10	.10	.10	.10	IP NODE NAMES				Name	IP Address		Name	IP Address	CDR_Server	10	.10	.30	.20	clan	10	.10	.10	.12	default	0	.0	.0	.0	procr	10	.10	.30	.10

Step	Description
5.	<p data-bbox="277 235 1503 302">If Intra-switch CDR is enabled (Step 3), enter the command change intra-switch-cdr and enter the extensions for which intra-switch calls will generate CDR data.</p> <pre data-bbox="277 331 1520 995"> change intra-switch-cdr Page 1 of 2 INTRA-SWITCH CDR Assigned Members: 3 of 5000 administered 1: 3000 19: 37: 55: 73: 91: 2: 3001 20: 38: 56: 74: 92: 3: 3003 21: 39: 57: 75: 93: 4: 22: 40: 58: 76: 94: 5: 23: 41: 59: 77: 95: 6: 24: 42: 60: 78: 96: 7: 25: 43: 61: 79: 97: 8: 26: 44: 62: 80: 98: 9: 27: 45: 63: 81: 99: 10: 28: 46: 64: 82: 100: 11: 29: 47: 65: 83: 101: 12: 30: 48: 66: 84: 102: 13: 31: 49: 67: 85: 103: 14: 32: 50: 68: 86: 104: 15: 33: 51: 69: 87: 105: 16: 34: 52: 70: 88: 106: 17: 35: 53: 71: 89: 107: 18: 36: 54: 72: 90: 108: </pre> <p data-bbox="277 1037 1503 1251">Note: For ease of implementation, special application (SA8202) Intra-Switch CDR by COS is an optional feature that allows customers to enable intra-switch CDR for extensions that are assigned a COS with intra-switch CDR activated. The customer does not have to manually add individual extensions in the intra-switch-cdr form. The SA8202 feature also removes the 1000 and 5000 extension limit for the S8300 and S8500, respectively, allowing CDR records to be generated for as many extensions as are administered on the switch.</p>

Step	Description
6.	<p>For each trunk group for which CDR records are desired, enter the command change trunk-group n, where n is the trunk group number, and set CDR Reports to “y”. The example below depicts the trunk group containing trunks connected to the PSTN in the sample configuration.</p> <pre> Change trunk-group 3 Page 1 of 20 TRUNK GROUP Group Number: 3 Group Type: co CDR Reports: y Group Name: PSTN COR: 1 TN: 1 TAC: 103 Direction: two-way Outgoing Display? n Dial Access? y Busy Threshold: 255 Night Service: Queue Length: 0 Country: 1 Incoming Destination: 50001 Comm Type: voice Auth Code? n Digit Absorption List: Prefix-1? y Trunk Flash? n Toll Restricted? n TRUNK PARAMETERS Trunk Type: loop-start Outgoing Dial Type: automatic Trunk Termination: 600ohm Disconnect Timing(msec): 500 Auto Guard? n Call Still Held? n Sig Bit Inversion: none Analog Loss Group: 6 Digital Loss Group: 11 Trunk Gain: high Disconnect Supervision - In? y Out? n Cyclical Hunt? n Answer Supervision Timeout: 10 Receive Answer Supervision? n </pre>

4. Configure the Avaya C364T Converged Stackable Switch

No special configuration of this device is necessary in this configuration.

5. Configure the Proteus Office Application

The following describes the configuration of the Proteus Office switch interface program. This configuration is performed during the second phase of the Proteus application installation.

Please refer to the Proteus Office Installation documentation for details of Phase 1 of the Proteus Office application. The documentation can be found on <http://www.proteusoffice.com>

On reboot of the PC, the following screens appear in the order shown:

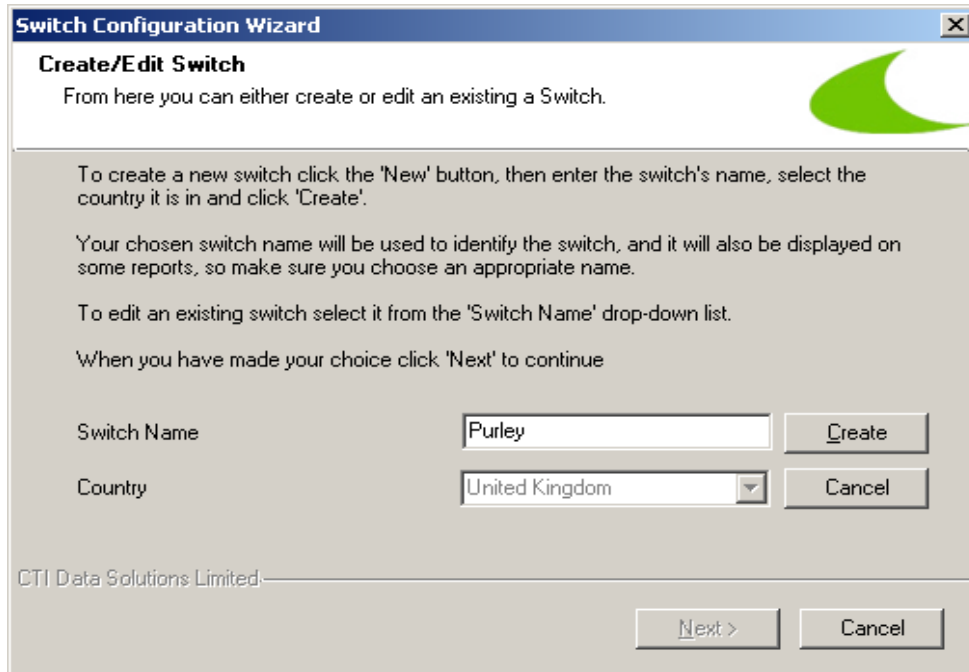

5.1. Switch Configuration Wizard

Click **Start** to begin.

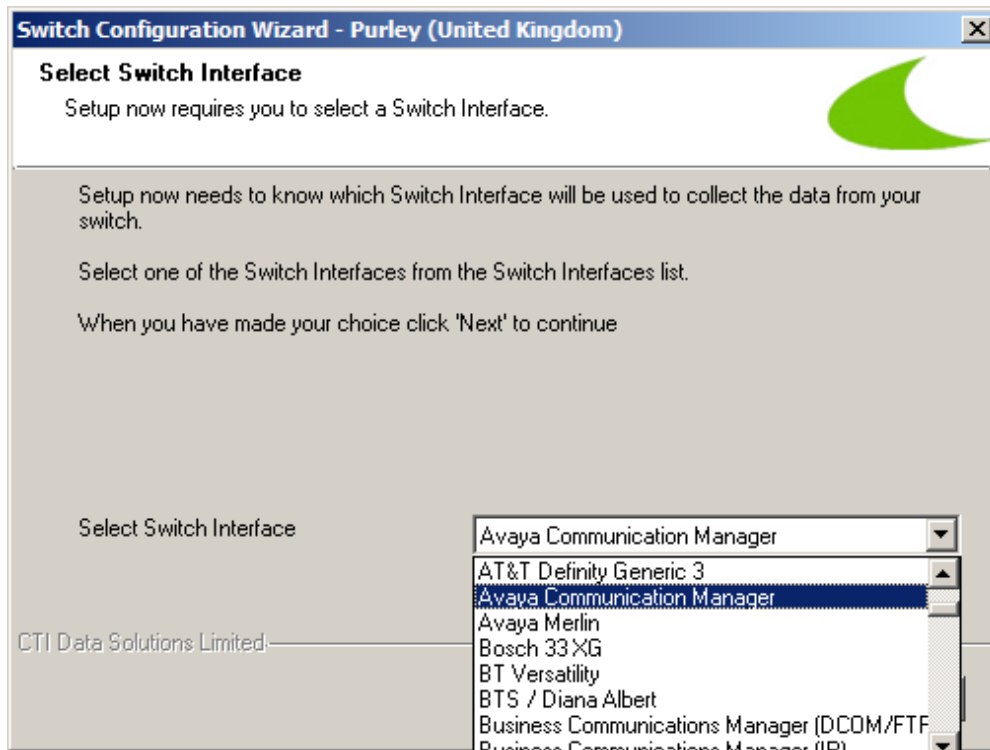

5.2. Create/Edit Switch

Enter a site or switch name for Avaya Communication Manager, then click the **Create** button then the **Next** button.

5.3. Select Switch Interface

Select 'Avaya Communication Manager' from the list of switch interfaces, and then click the **Next** button.

5.4. Create New Area

Enter an area dialing code, for example 020 for London and then click the **Search** button to search the database. If found, the Location will be displayed and the **Next** button will be enabled. Click the **Next** button.

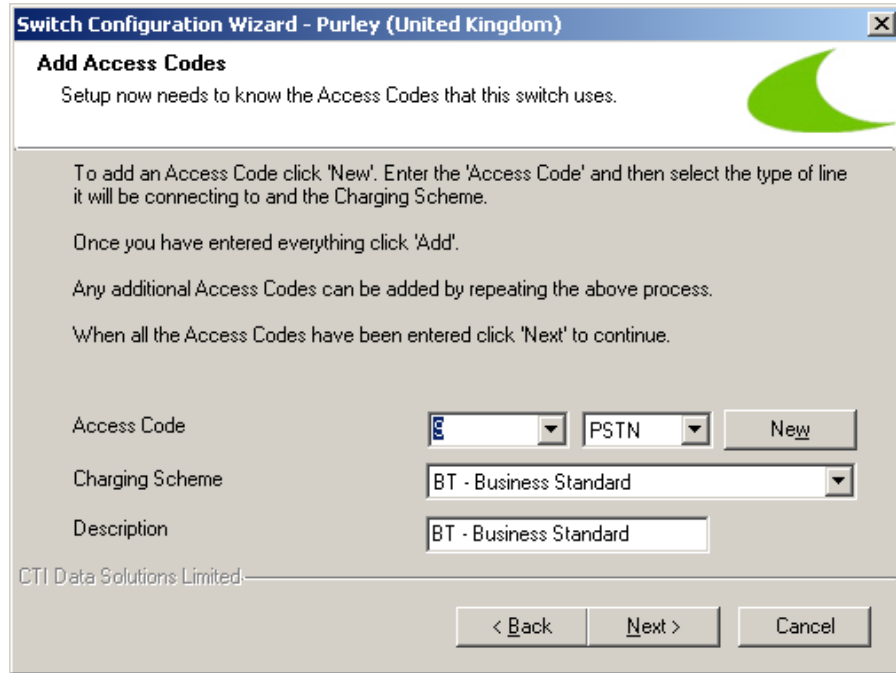

The screenshot shows a dialog box titled "Switch Configuration Wizard - Purley (United Kingdom)". The main heading is "Create New Area". Below the heading, it says "Setup now requires you to create a new area." There is a green logo on the right. The instructions state: "Enter the local area code that will be used to 'localise' the locations for the current Switch and then click Search. If a match is found for the local area code, the name of the local area will be displayed. If a match is not found an error will be displayed and you will be prompted to re-enter the code." The form has two input fields: "Exchange Code" with the value "020" and a "Search" button to its right; and "Location" with the value "London". At the bottom, there are three buttons: "< Back", "Next >", and "Cancel". The footer text is "CTI Data Solutions Limited."

5.5. Add Access Codes

Create an access code that will be used to link the selected charging scheme for costing. Note that an access code needs to be created even if the switch does not output an access code. This feature allows multiple charging schemes to be installed for systems using multiple carriers for outgoing calls.

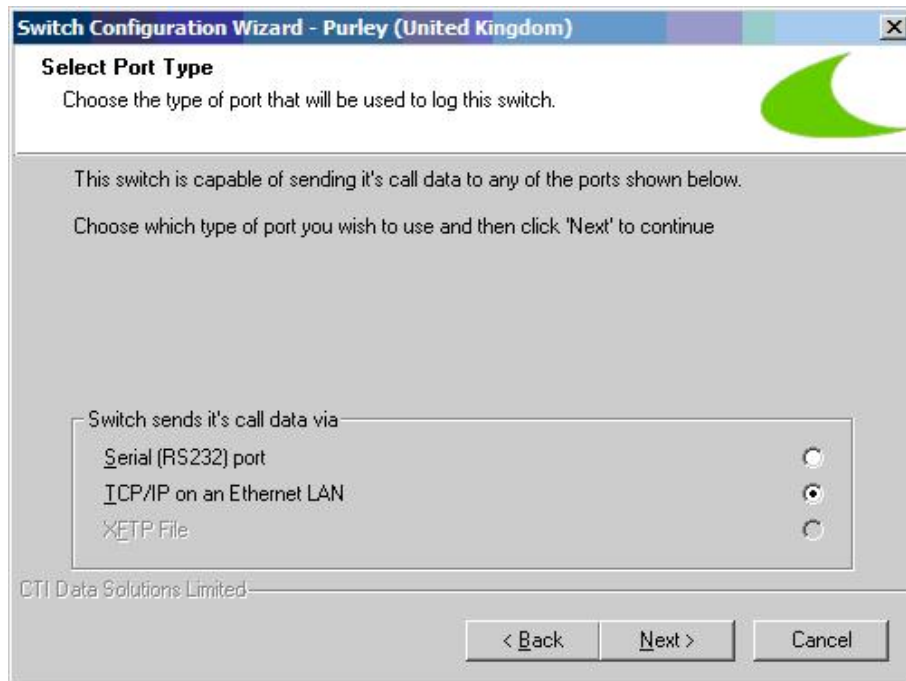

The screenshot shows a dialog box titled "Switch Configuration Wizard - Purley (United Kingdom)". The main heading is "Add Access Codes". Below the heading, it says "Setup now needs to know the Access Codes that this switch uses." There is a green logo on the right. The instructions state: "To add an Access Code click 'New'. Enter the 'Access Code' and then select the type of line it will be connecting to and the Charging Scheme. Once you have entered everything click 'Add'. Any additional Access Codes can be added by repeating the above process. When all the Access Codes have been entered click 'Next' to continue." The form has three input fields: "Access Code" with the value "9", a dropdown menu for "PSTN", and an "Add" button; "Charging Scheme" with a dropdown menu showing "BT - Business Standard"; and "Description" with a list box showing "BT - Business Standard", "Cable & Wireless - UKLink PriceWatch 50", and "Free". At the bottom, there are three buttons: "< Back", "Next >", and "Cancel". The footer text is "CTI Data Solutions Limited."

Click the **Add** button to enable the **Next** button.

Click **Next** to continue configuring the TCP/IP settings.

5.6. Select Type of Port to Log Data

Select the type of port to which Avaya Communication Manager sends its call data. For this configuration, TCP/IP on an Ethernet LAN was selected.

5.7. Configure TCP/IP

Enter the IP address of the C-LAN (S8500) or Processor Ethernet (S8300) and the port that data will be output on.

Switch Configuration Wizard - Purley (United Kingdom)

Configure TCP/IP
TCP/IP settings that will be used to collect call data from this switch.

Enter the TCP/IP address of the switch/buffer where the calls are to be collected from in the TCP/IP address fields.

A default TCP/IP port is displayed in the Port Number field, if nothing else is using this port you should use it. If the port is already in use then you will have to enter an alternative port

When you have made your choice click 'Next' to continue.

Port Description:

TCP/IP Address:

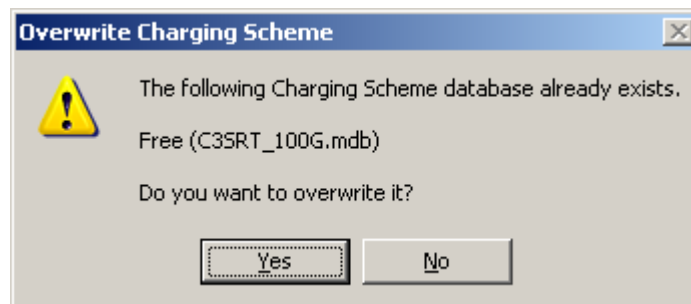

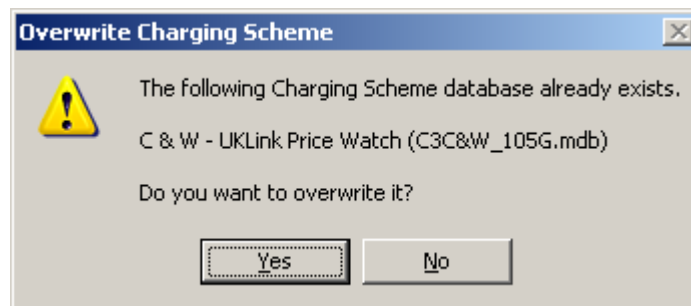

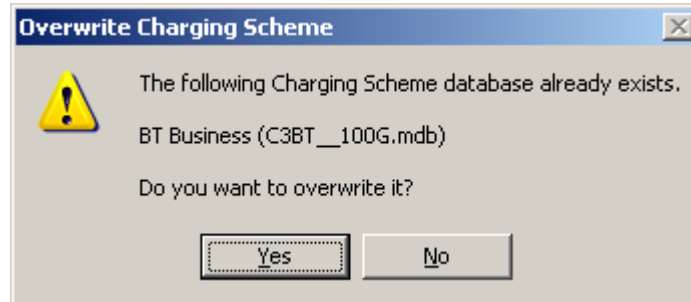

Port Number:

CTI Data Solutions Limited

< Back Next > Cancel

5.8. Update Switch Configuration

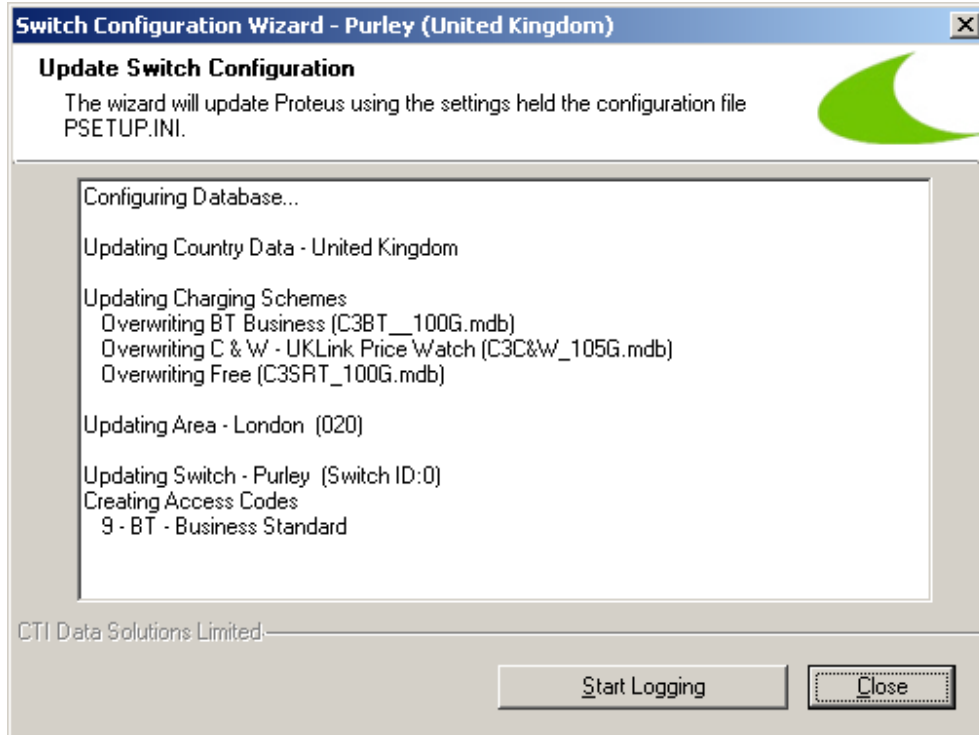

Click **Yes** when prompted to overwrite the charging scheme(s).

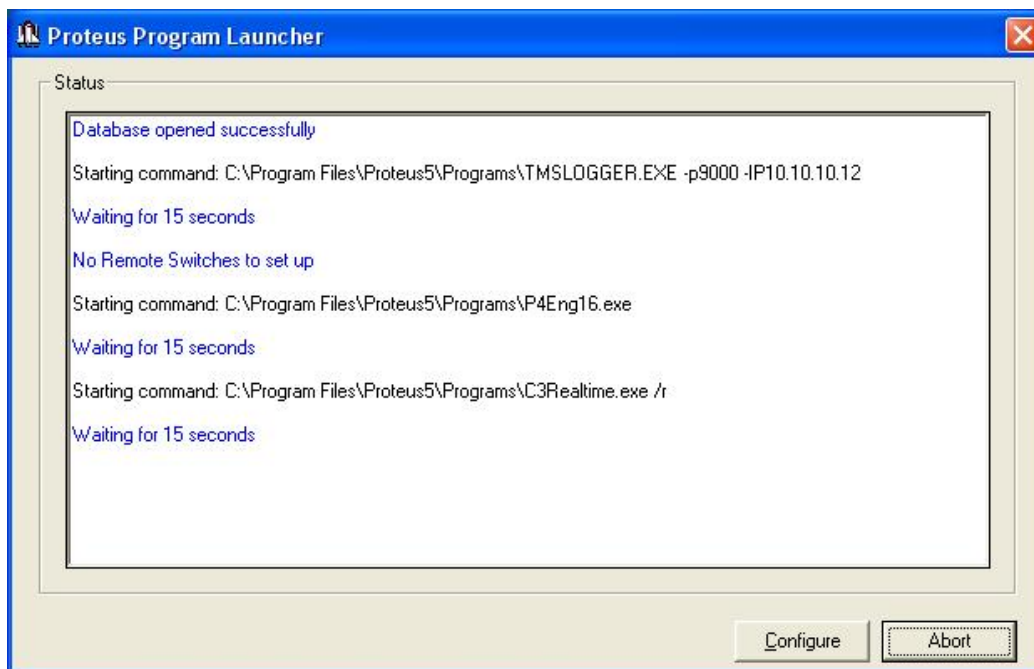

Click **Start Logging** to start the Proteus Office programs including the switch interface program

IMPORTANT NOTE!

The current version of the Avaya Communication Manager CDR interface must be installed (see Section 2). This is available from the CTI Data Solutions support website (<http://support.ctidata.co.uk>).

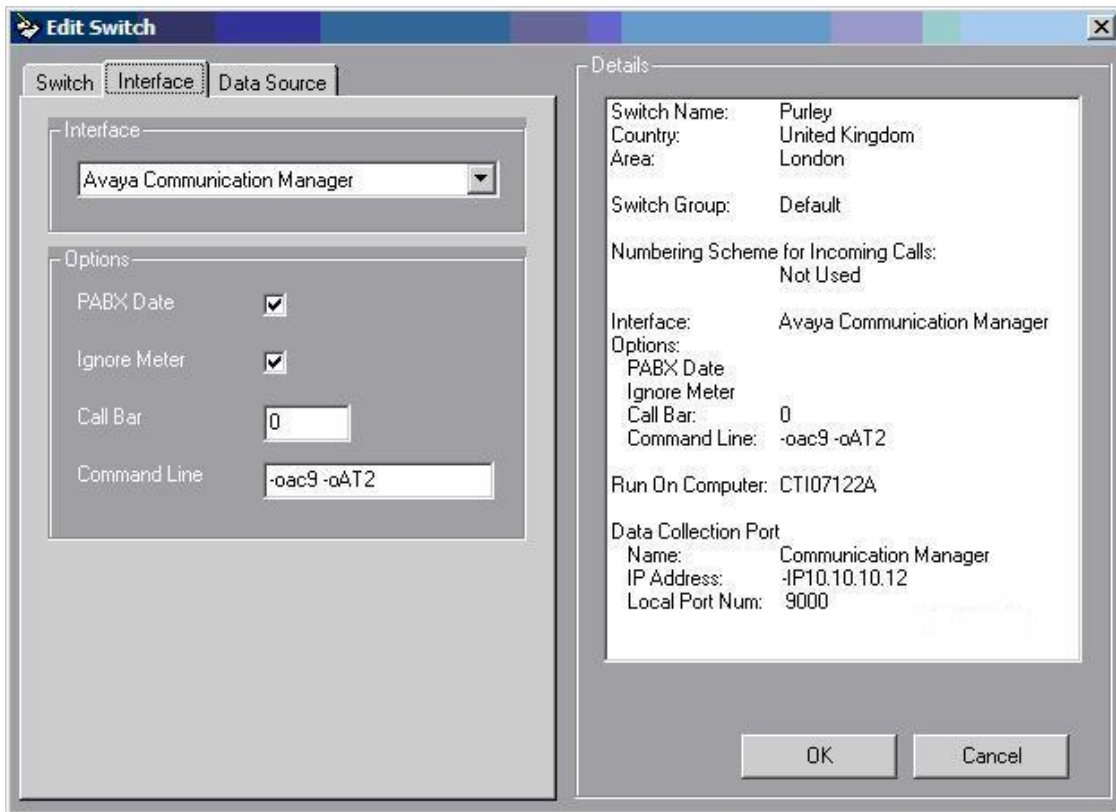

The Proteus Office Programs Launcher will be started.

Wait a few moments for the programs to start. The Switch Interface, Proteus Costing Engine and Proteus Report Scheduler will be launched.

5.9. Proteus Edit Switch screen

Once started, click the **Proteus Office** icon on the desktop to start using Proteus Office.

The command line option `-oAT<num>` is used to specify the CDR format to log.

`-oAT2` configures the switch interface to log the custom format specified (see below) for the verification test.

6. Interoperability Compliance Testing

A generic call account and billing test plan was used and customized to include the specific features of the CTI Data Solutions Proteus Office application.

The interoperability compliance test included feature, functionality and performance load testing. The testing examined the Proteus Office 5.0 interoperability with Avaya Communication Manager 3.0. The majority of the testing focused on the ability of the Proteus Office application to collect and process the CDR data produced by Avaya Communication Manager server correctly. The source and destination of each call was verified on the Proteus Office application to see if it was the same as what the Avaya Communication Manager outputted.

Important Note: The Proteus application 5.0 uses the standard CDR link, instead of using the Reliable Session Protocol (RSP) link to communicate with Avaya Communication Manager. For example, this could mean that ten minutes worth of calls could be potentially lost before Avaya Communication Manager starts buffering the calls if the network cable is unplugged from the Proteus server. A secondary CDR link on Avaya Communication Manager may be configured to output CDR records to another CTI Data Solutions server to collect CDR records if the primary CDR link goes down.

6.1. General Test Approach

All feature functionality test cases were performed manually. The general test approach entailed verifying CDR collection for different call types, such as trunk calls, intra-switch calls, conference calls, transferred calls, and forwarded calls. Compliance testing also verified the compatible CDR record formats supported by Proteus Office. Performance tests verified CDR collection under a bulk call load.

6.2. Test Results

All feature and performance tests passed. The Proteus Office successfully captured and processed call records from Avaya Communication Manager. Proteus Office also successfully processed the CDR data, performed call costing, and produced call accounting reports.

Important Note: The Proteus application 5.0 uses the standard CDR link, instead of using the Reliable Session Protocol (RSP) link to communicate with Avaya Communication Manager. For example, this could mean that ten minutes worth of calls could be potentially lost before Avaya Communication Manager starts buffering the calls if the network cable is unplugged from the Proteus server. A secondary CDR link on Avaya Communication Manager may be configured to output CDR records to another CTI Data Solutions server to collect CDR records if the primary CDR link goes down.

7. Verification Steps

Check that Avaya Communication Manager is outputting CDRs and that the Proteus switch interface has been configured correctly as follows:

1. Communication Manager CDR Output:

- Click the icon on the bottom right hand corner of the Proteus switch interface screen.
- Click the **View** button.
- Make a test call.
- Check that the CDR is displayed in the window.

Notes:

1. This is raw data from Avaya Communication Manager being accessed over the IP connection. Data in this window confirms Avaya Communication Manager is outputting data over the specified IP port.
2. NetStat and/or Hyperterminal (Windows utility programs) can be used to monitor open ports and check for output from Avaya Communication Manager.

2. Switch Interface logging:

- If CDRs are displayed in the View window, check that the Calls Logged counter is being incremented to confirm that the switch interface is logging correctly.

8. Support

Customers requiring technical support for the Proteus Office can contact CTI Data Solutions Ltd by calling Tel: +44 (0) 84 5123 2761 or e-mailing support@ctidata.co.uk. Customers may also visit the support website at <http://support.ctidata.co.uk>.

9. Conclusion

These Application Notes describe the required configuration steps for the Proteus Office 5.0 to successfully interoperate with Avaya Communication Manager. Features, functionality, and performance were successfully validated. The configuration described in these Application Notes has been successfully compliance tested.

10. Additional References
