

Avaya Solution & Interoperability Test Lab

Application Notes for Configuring Avaya Aura® Communication Manager Rel. 7.0, Avaya Aura® Session Manager Rel. 7.0 and Avaya Session Border Controller for Enterprise Rel. 7.0 to support Claro SIP Trunking Services – Issue 1.0

Abstract

These Application Notes describe the procedures for configuring Session Initiation Protocol (SIP) Trunking service for an enterprise solution consisting of Avaya Aura® Communication Manager Rel. 7.0, Avaya Aura® Session Manager Rel. 7.0, and Avaya Session Border Controller for Enterprise Rel. 7.0 to support Claro SIP Trunking Services.

The test was performed to verify SIP trunk features including basic calls, call forward (all calls, busy, no answer), call transfer (blind and consult), conference, and voice mail. The calls were placed to and from the PSTN with various Avaya endpoints.

Claro SIP Trunking Service provides PSTN access via SIP trunks between the enterprise and Claro's network as an alternative to legacy analog or digital trunks. This approach generally results in lower cost for the enterprise.

Readers should pay attention to **Section 2**, in particular the scope of testing as outlined in **Section 2.1** as well as the observations noted in **Section 2.2**, to ensure that their own use cases are adequately covered by this scope and results.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted via the DevConnect Program at the Avaya Solution and Interoperability Test Lab.

1. Introduction

These Application Notes describe the steps required to configure Session Initiation Protocol (SIP) trunk service between the service provider Claro and an Avaya SIP-enabled enterprise solution.

In the sample configuration, the Avaya SIP-enabled enterprise solution consists of an Avaya Aura® Communication Manager Rel. 7.0 (hereafter referred to as Communication Manager), Avaya Aura® Session Manager Rel. 7.0 (hereafter referred to as Session Manager), Avaya Session Border Controller for Enterprise Rel. 7.0 (hereafter referred to as Avaya SBCE), and various Avaya endpoints. This solution does not extend to configurations without the Avaya Session Border Controller for Enterprise or Avaya Aura® Session Manager.

During the interoperability testing, feature test cases were executed to ensure interoperability between Claro and Communication Manager.

During the interoperability testing, a VPN connection was used to connect the simulated Avaya enterprise network to Claro's network via the public Internet. The connection could also be done without the use of VPN, by directly connecting the Avaya SBCE to a public facing SBC located in Claro's network. This is accomplished by assigning public IP addresses, capable of being reached across the public Internet, to the Avaya SBCE (interface B1) and to the Claro SBC.

Customers using an Avaya SIP-enabled enterprise solution with Claro SIP Trunking Service are able to place and receive PSTN calls via the SIP protocol. The converged network solution is an alternative to traditional analog trunks and/or PSTN trunks such as ISDN-PRI. This approach generally results in lower cost for the enterprise.

The terms "Service Provider" and "Claro" will be used interchangeable throughout these Application Notes.

2. General Test Approach and Test Results

The general test approach was to simulate an enterprise site in the Avaya Solution & Interoperability Test Lab by connecting Communication Manager, Session Manager and the Avaya SBCE to Claro SIP Trunking Service via the public internet, as depicted in **Figure 1**.

DevConnect Compliance Testing is conducted jointly by Avaya and DevConnect members. The jointly-defined test plan focuses on exercising APIs and/or standards-based interfaces pertinent to the interoperability of the tested products and their functionalities. DevConnect Compliance Testing is not intended to substitute for full product performance or feature testing performed by DevConnect members, nor is it to be construed as an endorsement by Avaya of the suitability or completeness of a DevConnect member's solution.

2.1. Interoperability Compliance Testing

To verify SIP trunk interoperability, the following areas were tested for compliance:

- Response to SIP OPTIONS queries.
- Incoming calls from the PSTN were routed to DID numbers assigned by Claro. Incoming PSTN calls were terminated to the following endpoints: Avaya 96x0 Series IP Deskphones (H.323), Avaya 96x1 Series IP Deskphones (H.323 and SIP), Avaya 2420 Digital Deskphones, Avaya one-X® Communicator soft phone (H.323 and SIP), Avaya Communicator for Windows (SIP) soft phone, analog Deskphones.
- Inbound and outbound PSTN calls to/from Remote Workers using Avaya 96x1 deskphones (SIP), Avaya one-X® Communicator (SIP) and Avaya Communicator for Windows (SIP).
- Outgoing calls to the PSTN were routed via Claro's network to the various PSTN destinations.
- Proper disconnect when the caller abandons the call before the call is answered.
- Proper disconnect via normal call termination by the caller or the called parties.
- Proper disconnect by the network for calls that are not answered (with voicemail off).
- Proper response to busy endpoints.
- Proper response/error treatment when dialing invalid PSTN numbers.
- Proper Codec negotiation and two way speech-path. Testing was performed with codecs: G.711MU, G.711A and G.729A (Claro's preferred codec order).
- No matching codecs.
- Voicemail and DTMF tone support (leaving and retrieving voice mail messages, etc.).
- Outbound Toll-Free calls, interacting with IVR (Interactive Voice Response systems).
- Calling number blocking (Privacy).
- Call Hold/Resume (long and short duration).
- Call Forward (unconditional, busy, no answer).
- Blind Call Transfers.
- Consultative Call Transfers.
- Station Conference.
- EC500 (Extension to Cellular) calls.
- Simultaneous active calls.
- Long duration calls (over one hour).
- Proper response/error treatment to all trunks busy.
- Proper response/error treatment when disabling SIP connection.
- T.38 fax.

Note: Remote Worker was tested as part of this solution. The configuration necessary to support remote workers is beyond the scope of these Application Notes and is not included in these Application Notes.

Items not supported or not tested included the following:

- Inbound Toll-Free calls, outbound Toll-Free calls, 911 calls (emergency), “0” calls (Operator), 0+10 digits calls (Operator Assisted), and 411 calls (Local Directory Assistance) were not tested.
- The SIP REFER method for call redirection was not tested for reasons noted in **Section 2.2**.

2.2. Test Results

Interoperability testing of Claro SIP Trunk service with the Avaya SIP-enabled enterprise solution was completed successfully with the following observations/limitations.

- **SIP REFER:** Calls from the PSTN to Communication Manager that are re-directed to another PSTN endpoint by the Communication Manager user, with REFER enabled in Communication Manager (**Network Call Redirection** set to “y” under the **trunk-group**), did not work properly. Testing was done with REFER disabled in Communication Manager (**Network Call Redirection** set to “n” under the **trunk-group**), refer to **Section 5.7**.
- **Caller ID display on Call Forward to the PSTN:** For Calls from the PSTN to Communication Manager which were Forwarded back out to the PSTN, the caller ID number displayed at the PSTN was always of the first DID number assigned to the SIP Trunk, regardless of the PSTN number being used to originate the call.
- **Caller ID display on EC500 extension to cellular:** For EC500 extension to cellular calls the Caller ID display at the Mobile/cellular station was always of the first DID number assigned to the SIP Trunk, regardless of the PSTN number being used to originate the call.
- **No matching codec on outbound calls:** If an unsupported audio codec is received by Claro on the SIP Trunk (e.g., 726A-32K), Claro will respond with “500 Server Internal Error” instead of “488 Not Acceptable Here”, the user will hear re-order tones. This issue does not have any user impact, it is listed here simply as an observation.
- **SIP UPDATE:** SIP UPDATES was causing problems with call transfers to the PSTN and with other call types to the PSTN. For this solution SIP UPDATES needs to be disabled on the SIP Trunk. SIP UPDATE was disabled on the SIP Trunk, refer to **Section 5.7**.
- **Music on hold:** With Communication Manager configured to play music any time calls were placed on-hold by Communication Manager users, music was not played to PSTN users. The issue was related to the manner in which Claro currently handles the SIP messages Communication Manager includes in the SDP of re-INVITES it sends when calls are placed on-hold. When a call from the PSTN is placed on-hold by a Communication Manager user, Communication Manager sends a re-INVITE with “sendonly” in the SDP, in response, Claro sends a 200 OK with “inactive” in the SDP. This response caused the audio path to be closed between Communication Manager and the PSTN user, thus resulting in the user not hearing music while on hold. The issue was solved at the Avaya SBCE by removing the “sendonly” message Communication Manager includes in the SDP of re-INVITES, in response, Claro sends a 200 OK with “sendrecv” in the SDP, opening the audio path in between Communication Manager and the PSTN user, thus resulting in the PSTN user hearing music while he/she is on hold. Refer to **Section 7.2.3**.

- **SIP header optimization:** There are multiple SIP headers and parameters used by Communication Manager and Session Manager, some of them Avaya proprietary, that had no significance in the service provider's network. These headers were removed with the purpose of blocking enterprise information from being propagated outside of the enterprise boundaries, to reduce the size of the packets entering the service provider's network and to improve the solution interoperability in general. The following headers were removed from outbound messages using an Adaptation in Session Manager: AV-Global-Session-ID, AV-Correlation-ID, Alert-Info, Endpoint-View, P-AV-Message-id, P-Charging-Vector and P-Location (**Section 6.4**). Additionally, the parameters "gsid" and "epv" were removed from outbound Contact headers using a Signaling Script in the Avaya SBCE (**Section 7.2.3**).

2.3. Support

For support on Claro systems visit the corporate Web page at:

<http://www.claro.com.do/wps/portal/do/sc/empresas>

Avaya customers may obtain documentation and support for Avaya products by visiting <http://support.avaya.com>. Alternatively, in the United States, (866) GO-AVAYA (866-462-8292) provides access to overall sales and service support menus.

3. Reference Configuration

Figure 1 below illustrates the test configuration used. The test configuration simulates an enterprise site with an Avaya SIP-enabled enterprise solution connected to the Claro SIP Trunk service through the public Internet.

The Avaya components used to create the simulated customer site included:

- Avaya Aura® Communication Manager running on VMware (ESXi 5.5) platform.
- Avaya Aura® Session Manager running on VMware (ESXi 5.5) platform.
- Avaya Aura® System Manager running on VMware (ESXi 5.5) platform.
- Avaya Session Border Controller for Enterprise running on a Dell R210 V2 Server.
- Avaya Aura® Messaging running on VMware (ESXi 5.5) platform.
- Avaya Aura® Media Server running on VMware (ESXi 5.5) platform.
- Avaya G450 Media Gateway.
- Avaya 96x0-Series IP Deskphones (H.323).
- Avaya 96x1-Series IP Deskphones (H.323 and SIP).
- Avaya one-X® Communicator soft phones (H.323 and SIP).
- Avaya Communicator for Windows soft phone (SIP)
- Avaya 2420 Digital Deskphones.
- Analog Deskphones.
- Desktop PC running administration interfaces.

Located at the edge of the enterprise is a VPN Firewall, followed by the Avaya SBCE. The Avaya SBCE has two physical interfaces: interface **B1** is used to connect to the public network, interface **A1** is used to connect to the private network. Since a VPN connection was used with this solution to connect Claro's network to the enterprise, the **A1** interface was used for access to the private enterprise network and to route calls to Claro's network across the VPN tunnel. In this solution, the **B1** interface was used for remote workers access to the enterprise. The configuration required for the **B1** interface is not discussed in this document.

When a VPN connection is not used, the **B1** interface is normally used for remote workers access to the private network and to route calls to the Service Provider across the public Internet.

All SIP and RTP traffic entering or leaving the enterprise flows through the Avaya SBCE and through the VPN Firewall. The Avaya SBCE provides network address translation at both the IP and SIP layers. The transport protocol between the Avaya SBCE and Claro, through the VPN Tunnel, and across the public Internet, is SIP over UDP. The transport protocol between the Avaya SBCE and Session Manager across the enterprise IP network is SIP over TCP. The transport protocol between Session Manager and Communication Manager across the enterprise IP network is SIP over TLS. Note that for ease of troubleshooting during the testing, the compliance test was conducted with the Transport Method set to TCP between Session Manager and Communication Manager.

For security reasons, any actual public IP addresses and routable DID numbers used in the reference configuration have been masked.

One SIP trunk group was created between Communication Manager and Session Manager to carry the traffic to and from the Service Provider (two-way trunk group). To separate the codec settings required by the Service Provider from the codec used by the telephones, two IP network regions were used, each with a dedicated signaling group.

For inbound calls, the calls flowed from Claro to the Avaya SBCE through the VPN Tunnel, then to Session Manager. Session Manager used the configured dial patterns and routing policies to determine the recipient (in this case Communication Manager) and on which link to send the call. Once the call arrived at Communication Manager, further incoming call treatment, such as incoming digit translations and class of service restrictions are performed.

Outbound calls to the PSTN were first processed by Communication Manager for outbound feature treatment such as Automatic Route Selection (ARS) and Class of Service restrictions. Once Communication Manager selected the proper SIP trunk; the call was routed to Session Manager. Session Manager once again used the configured dial patterns and routing policies to determine the route to the Avaya SBCE for egress to Claro's network through the VPN Tunnel.

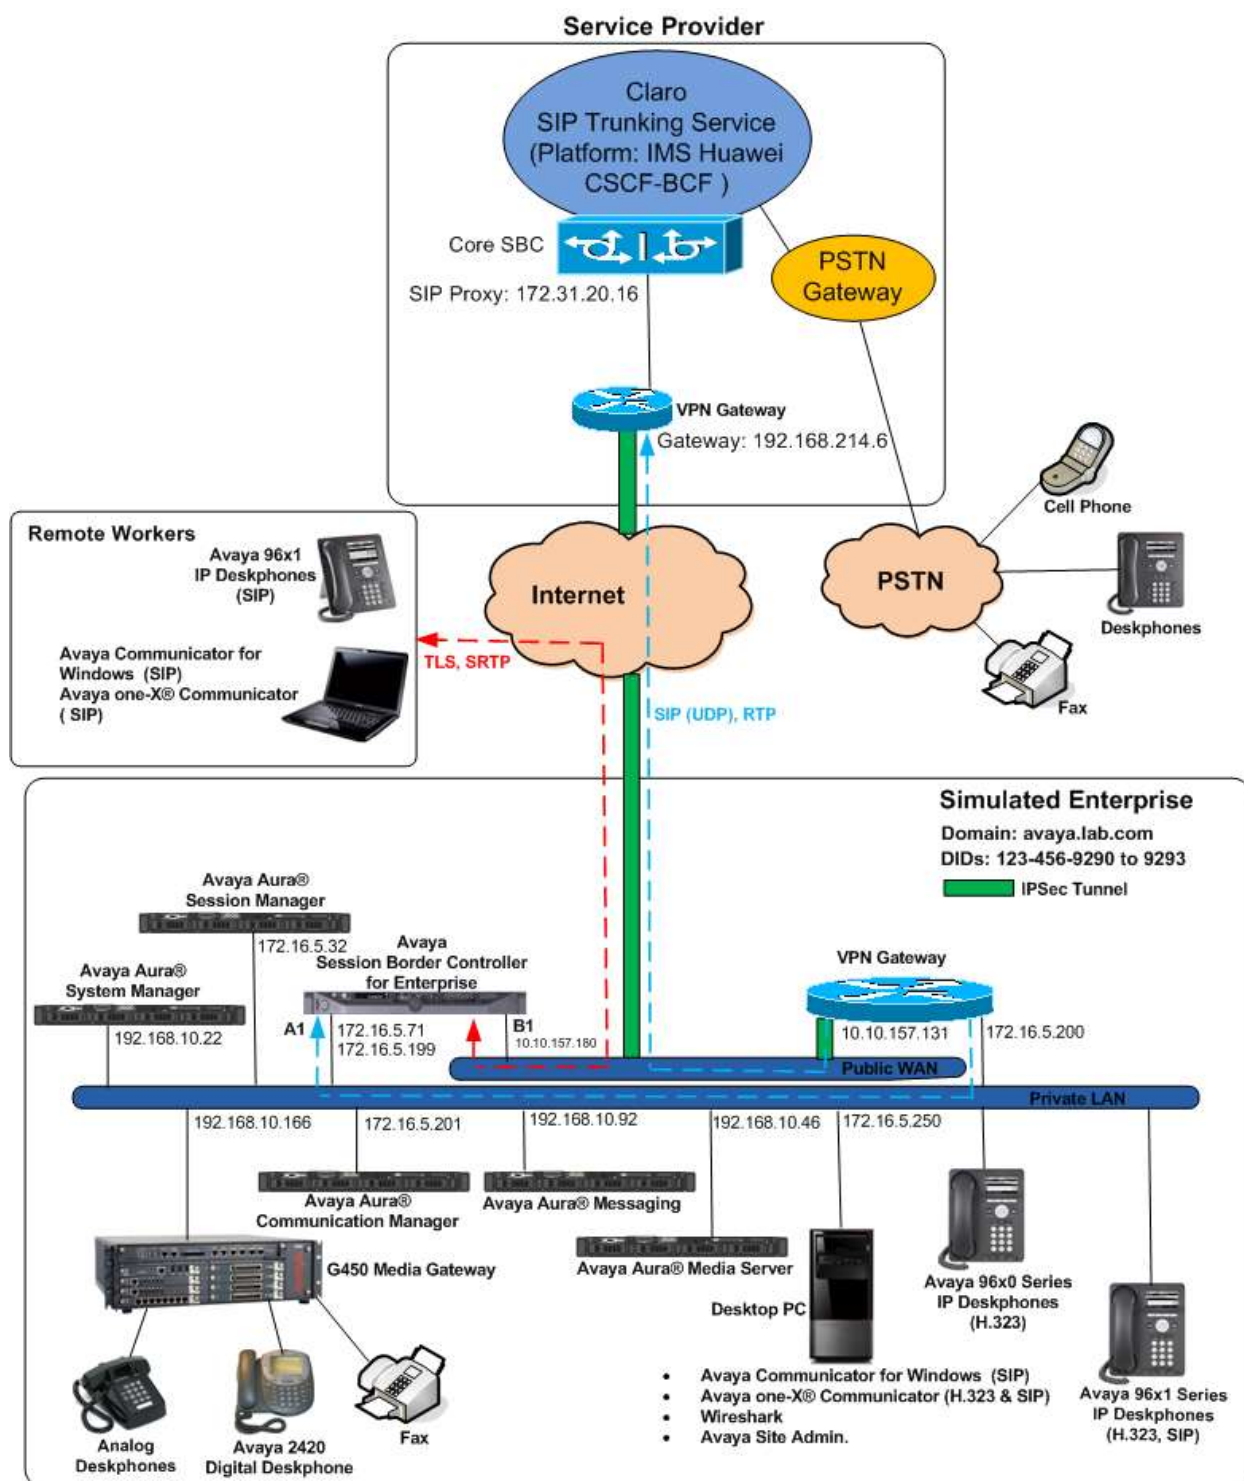

Figure 1: Avaya SIP-enabled Enterprise Solution and Claro SIP Trunking Service

4. Equipment and Software Validated

The following equipment and software were used for the compliance testing in the simulated enterprise:

Equipment/Software	Release/Version
Avaya	
Avaya Aura® Communication Manager running on VMware ESXi 5.5 platform	7.0.0.1.0 (00.0.441.0-22477)
Avaya Aura® Session Manager running on VMware ESXi 5.5 platform	7.0.0.0 (7.0.0.0.700007)
Avaya Aura® System Manager running on VMware ESXi 5.5 platform	7.0.0.0 Build No. 7.0.0.0.16266-7.0.9.912 Software Update Rev. No. 7.0.0.0.3929
G450 Gateway	37.19.0
Avaya Session Border Controller for Enterprise running on a DELL R210 V2 Server	7.0.0-21-6602
Avaya Aura® Media Server running on VMware ESXi 5.5 platform	7.7.0.226
Avaya Aura® Messaging running on VMware ESXi 5.5 platform	6.3.3 Service Pack 3 (MSG-03.0.141.0-348_0304)
Avaya Aura® Integrated Management Site Administrator	6.0.07
Avaya one-X® Communicator (SIP & H.323)	6.2.7.03-SP7
Avaya Communicator for Windows (SIP)	2.1.2.75
Avaya 96x0 Series IP Deskphones (H.323)	Avaya one-X® Desk phone Edition Version S3.250A
Avaya 96x1 Series IP Deskphones (H.323)	Avaya one-X® Deskphone H.323 Version 6.6029
Avaya 96x1 Series IP Deskphones (SIP)	Avaya one-X® Deskphone SIP Version 7.0.0.39
Avaya 2420 Series Digital Deskphone	--
Lucent Analog Deskphone	--
Claro	
IMS Huawei CSCF-BCF	V100R010C00SPC100
SBC Huawei SessionEngine2600	V200R009ENG30SPC100

Table 2 – Hardware and Software Components Tested

The specific configuration above was used for the compliance testing. Note that this solution is compatible with other Avaya Servers and Media Gateway platforms running similar versions of Avaya Aura® Communication Manager and Avaya Aura® Session Manager.

5. Configure Avaya Aura® Communication Manager

This section describes the procedure for configuring Communication Manager. A SIP trunk is established between Communication Manager and Session Manager for use by signaling traffic to and from Claro. It is assumed that the general installation of Communication Manager, the Avaya G450 Media Gateway and the Avaya Aura® Media Server has been previously completed.

In configuring Communication Manager, various components such as ip-network-regions, signaling groups, trunk groups, etc. need to be selected or created for use with the SIP connection to the Service Provider. Unless specifically stated otherwise, any unused ip-network-region, signaling group, trunk group, etc. can be used for this purpose.

The Communication Manager configuration was performed using the Avaya Integrated Management Site Administrator. Some screens in this section have been abridged and highlighted for brevity and clarity in presentation. Note that the public IP addresses shown throughout these Application Notes have been edited so that the actual public IP addresses of the network elements are not revealed. Some screens captures will show the use of the **change** command instead of the **add** command, since the configuration used for the testing was previously added.

5.1. Licensing and Capacity

Use the **display system-parameters customer-options** command to verify that the **Maximum Administered SIP Trunks** value on **Page 2** is sufficient to support the desired number of simultaneous SIP calls across all SIP trunks at the enterprise, including any SIP trunks to the Service Provider. The example below shows one license with a capacity of **24000** trunks are available and **122** are in use. The license file installed on the system controls the maximum values for these attributes. If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to add additional capacity.

```
display system-parameters customer-options                               Page 2 of 12
                                OPTIONAL FEATURES

IP PORT CAPACITIES                                                    USED
      Maximum Administered H.323 Trunks: 12000 10
      Maximum Concurrently Registered IP Stations: 18000 2
      Maximum Administered Remote Office Trunks: 12000 0
      Maximum Concurrently Registered Remote Office Stations: 18000 0
      Maximum Concurrently Registered IP eCons: 414 0
      Max Concur Registered Unauthenticated H.323 Stations: 100 0
      Maximum Video Capable Stations: 41000 1
      Maximum Video Capable IP Softphones: 18000 7
      Maximum Administered SIP Trunks: 24000 122
      Maximum Administered Ad-hoc Video Conferencing Ports: 24000 0
      Maximum Number of DS1 Boards with Echo Cancellation: 522 0

(NOTE: You must logoff & login to effect the permission changes.)
```

On **Page 4**, verify that **ARS** is set to **y**.

```
display system-parameters customer-options                               Page 4 of 12

```

5.2. System Features

Use the **change system-parameters features** command to set the **Trunk-to-Trunk Transfer** field to **all** to allow incoming calls from the PSTN to be transferred to another PSTN endpoint. If for security reasons, incoming calls should not be allowed to transfer back to the PSTN, then leave this field set to **none**.

```
change system-parameters features                               Page 1 of 19

```

5.3. IP Node Names

Use the **change node-names ip** command to verify that node names have been previously defined for the IP addresses of the Avaya server running Communication Manager (**procr**), and for Session Manager (**Lab-HG-SM**). These node names will be needed for defining the Service Provider signaling group in **Section 5.6**.

```

change node-names ip                                               Page 1 of 2
IP NODE NAMES

Name      IP Address
ASBCE A1  172.16.5.71
Lab-HG-SM 172.16.5.32
MA-CM     192.168.10.12
default   0.0.0.0
media_server 192.168.10.46
msqserver 172.16.5.12
procr     172.16.5.201
procr6    ::

( 8 of 8 administered node-names were displayed )
Use 'list node-names' command to see all the administered node-names
Use 'change node-names ip xxx' to change a node-name 'xxx' or add a node-name

```

5.4. Codecs

Use the **change ip-codec-set** command to define a list of codecs to use for calls between the enterprise and the Service Provider. For the compliance test, **ip-codec-set 2** was used for this purpose. Claro SIP Trunking supports G.711MU, G.711A and G.729A. Thus, these codecs were included in this set. Enter **G.711MU**, **G.711A** and **G.729A** in the **Audio Codec** column of the table; this is Claro's preferred codec order. Default values can be used for all other fields.

```
change ip-codec-set 2                                     Page 1 of 2
```

IP CODEC SET

Codec Set: 2

	Audio Codec	Silence Suppression	Frames Per Pkt	Packet Size(ms)
1:	G.711MU	n	2	20
2:	G.711A	n	2	20
3:	G.729A	n	2	20
4:		-	-	
5:		-	-	
6:		-	-	
7:		-	-	

On Page 2, set the **Fax Mode** to **t.38-standard** (T.38 fax is supported by Claro).

```
change ip-codec-set 2                                     Page 2 of 2
```

IP CODEC SET

Allow Direct-IP Multimedia? ☐

	Mode	Redundancy	Packet Size(ms)
FAX	t.38-standard	0	
Modem	off	0	
TDD/TTY	US	3	
H.323 Clear-channel	n	0	
SIP 64K Data	n	0	20

ECH: y

5.5. IP Network Region

Create a separate IP network region for the Service Provider trunk. This allows for separate codec or quality of service settings to be used (if necessary) for calls between the enterprise and the Service Provider versus calls within the enterprise or elsewhere. For the compliance test, **IP-network-region 2** was chosen for the Service Provider trunk. Use the **change ip-network-region 2** command to configure region 2 with the following parameters:

- Set the **Authoritative Domain** field to match the SIP domain of the enterprise. In this configuration, the domain name is *avaya.lab.com*. This name appears in the “From” header of SIP messages originating from this IP region.
- Enter a descriptive name in the **Name** field.
- Enable **IP-IP Direct Audio** (shuffling) to allow audio traffic to be sent directly between IP endpoints without using media resources in the Avaya Media Gateway or the Avaya Aura® Media Server. Set both **Intra-region** and **Inter-region IP-IP Direct Audio** to *yes*. This is the default setting. Shuffling can be further restricted at the trunk level on the Signaling Group form.
- Set the **Codec Set** field to the IP codec set defined in **Section 5.4**.
- Default values can be used for all other fields.

On **Page 4**, define the IP codec set to be used for traffic between region 2 and region 1. Enter the desired IP codec set in the **codec set** column of the row with destination region (**dst rgn**) 1. Default values may be used for all other fields. The example below shows the settings used for the compliance test. It indicates that codec set 2 will be used for calls between region 2 (the Service Provider region) and region 1 (the rest of the enterprise).

change ip-network-region 2

5.6. Signaling Group

Use the **add signaling-group** command to create a signaling group between Communication Manager and Session Manager for use by the Service Provider SIP trunk. This signaling group is used for inbound and outbound calls between the Service Provider and the enterprise. For the compliance test, **signaling group 2** was used for this purpose and was configured using the parameters highlighted below.

- Set the **Group Type** field to *sip*.
- Set the **IMS Enabled** field to *n*. This specifies Communication Manager will serve as an Evolution Server for Session Manager.
- Set the **Transport Method** to the recommended default value of *tls* (Transport Layer Security). Note that for ease of troubleshooting during testing, the compliance test was conducted with the **Transport Method** set to *tcp*. The transport method specified here is used between Communication Manager and Session Manager. The transport method used between Session Manager and the Avaya SBCE is specified as TCP in **Sections 6.6** and **7.2.4**. Lastly, the transport method between the Avaya SBCE and Claro is UDP. This is defined in **Section 7.2.4**.
- Set the **Near-end Listen Port** and **Far-end Listen Port** to a valid unused port instead of the default well-known port value. (For TLS, the well-known port value is 5061). This is necessary so Session Manager can distinguish this trunk from the trunk used for other enterprise SIP traffic. The compliance test was conducted with the **Near-end Listen Port** and **Far-end Listen Port** set to **5070**. (For TCP, the well-known port value for SIP is 5060).

- Set the **Peer Detection Enabled** field to **y**. The **Peer-Server** field will initially be set to **others** and cannot be changed via administration. Later, the **Peer-Server** field will automatically change to **SM** once Communication Manager detects its peer as Session Manager.
- Set the **Near-end Node Name** to **procr**. This node name maps to the IP address of the Avaya Server running Communication Manager as defined in **Section 5.3**.
- Set the **Far-end Node Name** to **Lab-HG-SM**. This node name maps to the IP address of Session Manager as defined in **Section 5.3**.
- Set the **Far-end Network Region** to the IP network region defined for the Service Provider in **Section 5.5**.
- Set the **Far-end Domain** to the domain of the enterprise.
- Set **Direct IP-IP Audio Connections** to **y**. This field will enable media shuffling on the SIP trunk allowing Communication Manager to redirect media traffic directly between the inside IP of the Avaya SBCE and the enterprise endpoint. If this value is set to **n**, then the Avaya Media Gateway will remain in the media path of all calls between the SIP trunk and the endpoint.
- Set the **DTMF over IP** field to **rtp-payload**. This value enables Communication Manager to send DTMF transmissions using RFC 2833.
- Default values may be used for all other fields.

5.7. Trunk Group

Use the **add trunk-group** command to create a trunk group for the signaling group created in **Section 5.6**. For the compliance test, **trunk group 2** was configured using the parameters highlighted below.

- Set the **Group Type** field to *sip*.
- Enter a descriptive name for the **Group Name**.
- Enter an available trunk access code (TAC) that is consistent with the existing dial plan in the **TAC** field.
- Set the **Service Type** field to *public-ntwrk*.
- Set the **Signaling Group** to the signaling group shown in **Section 5.6**.
- Set the **Number of Members** field to the number of trunk members in the SIP trunk group. This value determines how many simultaneous SIP calls can be supported by this trunk.
- Default values were used for all other fields.

```
change trunk-group 2                                     Page 1 of 21

Dial Access? n      Night Service:
Queue Length: 0
Service Type: public-ntwrk      Auth Code? n
Member Assignment Method: auto
Signaling Group: 2
Number of Members: 10
```

On **Page 2**, verify that the **Preferred Minimum Session Refresh Interval (sec)** is set to a value acceptable to the Service Provider. This value defines the interval that re-INVITEs must be sent to keep the active session alive. Note that the value assigned to the **Preferred Minimum Session Refresh Interval (sec)** field is doubled and assigned to the “Min-SE” Header Field in SIP INVITE messages for calls originating from Communication Manager. Using the default setting of **600** seconds as in the example, the “Min-SE” Header Field would be populated for 1200 seconds in SIP INVITE messages originating from Communication Manager.

change trunk-group 2		Page 2 of 21

XOIP Treatment: <u>auto</u>		Delay Call Setup When Accessed Via IGAR? <u>n</u>
Caller ID for Service Link Call to H.323 1xC: <u>station-extension</u>		

On **Page 3**, set the **Numbering Format** field to *public*. This field specifies the format of the calling party number (CPN) sent to the far-end. Public numbers are automatically preceded with a + sign when passed in the SIP “From”, “Contact”, “P-Asserted Identity” and “Diversion” headers.

Set the **Replace Restricted Numbers** and **Replace Unavailable Numbers** fields to *y*. This will allow the CPN displayed on local endpoints to be replaced with the value set in **Section 5.2**, if the inbound call enabled CPN block.

Default values were used for all other fields.

```

  Modify Tandem Calling Number: no

  Show ANSWERED BY on Display? y
```

Page 4 was configured using the parameters highlighted below.

- Set the **Network Call Redirection** field to *n*. This setting directs Communication Manager **not** to use the SIP REFER message for transferring calls off-net to the PSTN, refer to **Section 2.2**.
- Set the **Send Diversion Header** field to *y*. When enabled, the Diversion Header (in the outbound INVITE message) provides additional information to the network if the call has been re-directed. This is needed to support call forwarding of inbound calls back to the PSTN and some Extension to Cellular (EC500) call scenarios.
- Set the **Support Request History** field to *n*.
- Set the **Telephone Event Payload Type** to *101*. The value preferred by Claro.
- Set the **Convert 180 to 183 for Early Media** to *y*.
- Set the **Always Use re-INVITE for Display Updates** to *y*. When enabled, UPDATE messages are disabled and are replaced with re-INVITE messages. UPDATE messages were causing problems and need to be disabled in Communication Manager (refer to **Section 2.2**).
- Set the **Identity for Calling Party Display** to *From*.

5.8. Calling Party Information

The calling party number is sent in the SIP “From”, “Contact” and “PAI” headers. Since public numbering was selected to define the format of this number (**Section 5.7**), use the **change public-unknown-numbering** command to create an entry for each extension which has a DID assigned. The DID numbers are assigned by the Service Provider. They are used to authenticate the caller. Each DID number is assigned to one enterprise internal extension or Vector Directory Numbers (VDNs).

The screen below shows DID numbers assigned for testing. The DID numbers were mapped to enterprise extensions 3041, 3044, 3045 and 3048. These 11-digit numbers were used for the outbound calling party information on the Service Provider trunk when calls were originated from these extensions.

change public-unknown-numbering 1					Page 1 of 2	
NUMBERING - PUBLIC/UNKNOWN FORMAT						
Ext Len	Ext Code	Trk Grp(s)	CPN Prefix	Total CPN Len		
4	3			4	Total Administered: 6	
4	5			4	Maximum Entries: 9999	
4	3041	2	11234569290	11	Note: If an entry applies to a SIP connection to Avaya Aura(R) Session Manager, the resulting number must be a complete E.164 number.	
4	3044	2	11234569226	11		
4	3045	2	11234569254	11		
4	3048	2	11234569243	11		
					Communication Manager automatically inserts a '+' digit in this case.	

In a real customer environment, normally DID numbers are comprised of the local extension plus a prefix. If this is true, then a single public numbering entry can be applied for all extensions. In the example below, all stations with a 4-digit extension beginning with 9 will send the calling party number as the **CPN Prefix** plus the extension number. The example shown in the screenshot below is assuming that the local extensions in the DID numbers begin with a 9 (e.g., 1123456**9**xxx).

```

change public-unknown-numbering 1
NUMERING - PUBLIC/UNKNOWN FORMAT
Total
Ext Ext Trk CPN
Len Code Grp(s) Prefix Len
4 3 4
4 5 4
4 9 2 1123456 11
Total Administered: 6
Maximum Entries: 9999
Note: If an entry applies to
a SIP connection to Avaya
Aura(R) Session Manager,
the resulting number must
be a complete E.164 number.
Communication Manager
automatically inserts
a '+' digit in this case.

```

5.9. Inbound Routing

DID numbers received from Claro were mapped to extensions using the incoming call handling treatment of the receiving trunk group. Use the **change inc-call-handling-trmt** command to create an entry for each DID number. Note that since Claro includes the “+” in the **Request-URI** of INVITE messages, the “+” was added to the **Incoming Number Digits**.

[illegible]

25 of 98
ClaroCM7SM7SBC7

5.10. Outbound Routing

In these Application Notes, the Automatic Route Selection (ARS) feature is used to route outbound calls via the SIP trunk to the Service Provider. In the sample configuration, the single digit **9** is used as the ARS access code. Enterprise callers will dial 9 to reach an “outside line”. This common configuration is illustrated below with little elaboration. Use the **change dialplan analysis** command to define a dialed string beginning with **9** of length **1** as a feature access code (**fac**).

change dialplan analysis			DIAL PLAN ANALYSIS TABLE						Page 1 of 12
			Location: all			Percent Full: 2			
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	
0	13	udp							
1	4	dac							
2	4	ext							
3	4	ext							
4	4	udp							
5	4	ext							
6	3	dac							
7	4	ext							
8	1	fac							
9	1	fac							
*	3	dac							
#	2	dac							

Use the **change feature-access-codes** command to configure **9** as the **Auto Route Selection (ARS) – Access Code 1**.

```

change feature-access-codes                                     Page 1 of 10
FEATURE ACCESS CODE (FAC)
Abbreviated Dialing List1 Access Code: _____
Abbreviated Dialing List2 Access Code: _____
Abbreviated Dialing List3 Access Code: _____
Abbreviated Dial - Prgm Group List Access Code: _____

Call Park Access Code: _____
Call Pickup Access Code: *44
CAS Remote Hold/Answer Hold-Unhold Access Code: _____
CDR Account Code Access Code: _____
Change COR Access Code: _____
Change Coverage Access Code: _____
Conditional Call Extend Activation: _____      Deactivation: _____
Contact Closure Open Code: _____      Close Code: _____

```

Use the **change ars analysis** command to configure the routing of dialed digits following the first digit 9. The example below shows a subset of the dialed strings tested as part of the compliance test. See **Section 2.1** for the complete list of call types tested. All dialed strings are mapped to **route pattern 2** which contains the SIP trunk to the Service Provider (as defined next).

```

change ars analysis 178                                     Page 1 of 2
ARS DIGIT ANALYSIS TABLE
Location: all                      Percent Full: 0

```

183	11	11	deny	fnpa	—	n
184	11	11	deny	fnpa	—	n
185	11	11	deny	fnpa	—	n
186	11	11	deny	fnpa	—	n
187	11	11	deny	fnpa	—	n
188	11	11	deny	fnpa	—	n

The route pattern defines which trunk group will be used for the call and performs any necessary digit manipulation. Use the **change route-pattern** command to configure the parameters for the Service Provider trunk route pattern in the following manner. The example below shows the values used for route pattern 2 during the compliance test.

- **Pattern Name:** Enter a descriptive name.
- **Grp No:** Enter the outbound trunk group for the Service Provider. For the compliance test, trunk group **2** was used.
- **FRL:** Set the Facility Restriction Level (**FRL**) field to a level that allows access to this trunk for all users that require it. The value of **0** is the least restrictive level.
- **Pfx Mrk:** **1** The prefix mark (**Pfx Mrk**) of one will prefix any FNPA 10-digit number with a 1 and leave numbers of any other length unchanged. This will ensure 1 + 10 digits are sent to the Service Provider for long distance North American Numbering Plan (NANP) numbers. All HNPA 10 digit numbers are left unchanged.

Note: To save all Communication Manager provisioning changes, enter the command **save translations**.

6. Configure Avaya Aura® Session Manager

This section provides the procedures for configuring Session Manager. The procedures include adding the following items:

- SIP domain
- Logical/physical Location that can be occupied by SIP Entities
- Adaptation module to perform dial plan manipulation.
- SIP Entities corresponding to Communication Manager, the Avaya SBCE and Session Manager
- Entity Links, which define the SIP trunk parameters used by Session Manager when routing calls to/from SIP Entities
- Routing Policies, which control call routing between the SIP Entities
- Dial Patterns, which govern to which SIP Entity a call is routed
- Session Manager, corresponding to the Session Manager server to be managed by System Manager.

It may not be necessary to create all the items above when configuring a connection to the Service Provider since some of these items would have already been defined as part of the initial Session Manager installation. This includes items such as certain SIP domains, Locations, Adaptations, SIP Entities, and Session Manager itself. However, each item should be reviewed to verify the configuration.

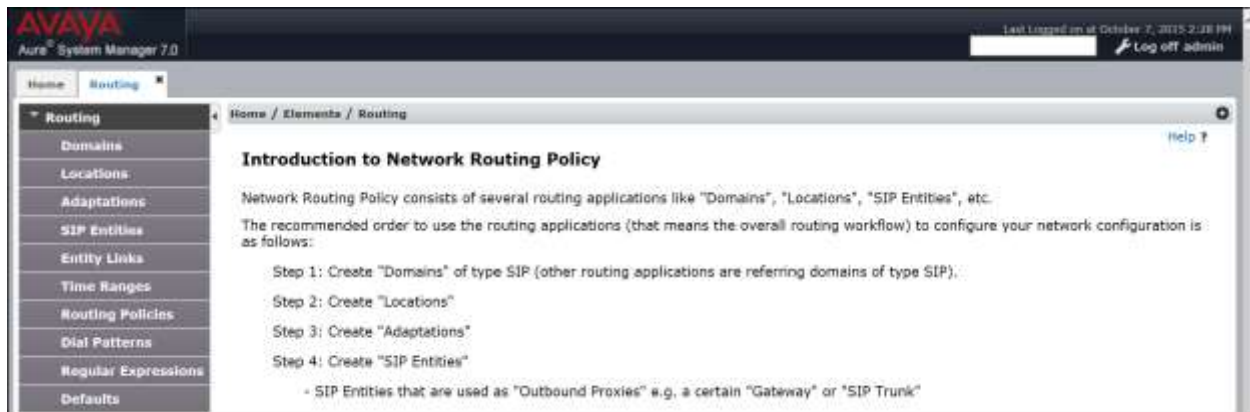

Note: Some of the default information in the screenshots that follow may have been cut out (not included) for brevity
--

6.1. System Manager Login and Navigation

Session Manager configuration is accomplished by accessing the browser-based GUI of System Manager, using the URL “https://<ip-address>/SMGR”, where “<ip-address>” is the IP address of System Manager. Log in with the appropriate credentials (not shown). The screen shown below is then displayed. Click on **Routing**.

The navigation tree displayed in the left pane below will be referenced in subsequent sections to navigate to items requiring configuration. Most items will be located under the **Routing** link shown below.

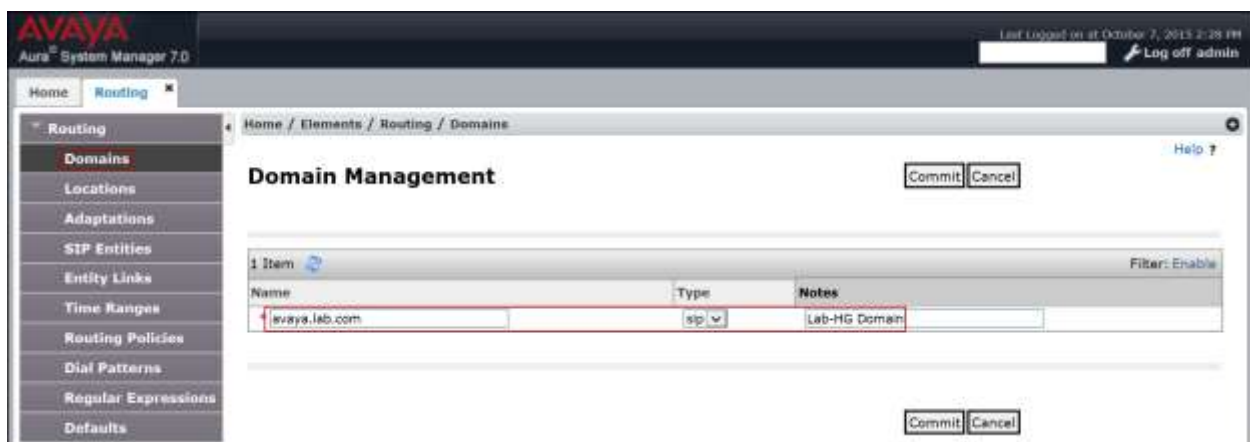

6.2. Specify SIP Domain

Create a SIP domain for each domain of which Session Manager will need to be aware in order to route calls. For the compliance test the enterprise domain **avaya.lab.com** was used.

To add a domain Navigate to **Routing → Domains** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Name:** Enter the domain name.
- **Type:** Select *sip* from the pull-down menu.
- **Notes:** Add a brief description (optional).
- Click **Commit** to save (not show).

The screen below shows the entry for the enterprise domain **avaya.lab.com**.

6.3. Add Location

Locations can be used to identify logical and/or physical locations where SIP Entities reside for the purposes of bandwidth management and call admission control. To add a location, navigate to **Routing → Locations** in the left-hand navigation pane and click the **New** button in the right pane (not shown).

In the **General** section, enter the following values. Use default values for all remaining fields:

- **Name:** Enter a descriptive name for the location.
- **Notes:** Add a brief description (optional).
- Click **Commit** to save.

The screen below shows the **HG Session Manager** location. This location will be assigned later to the SIP Entity corresponding to Session Manager.

The screenshot displays the Avaya Aura System Manager 7.0 web interface. The left-hand navigation pane shows the 'Routing' menu expanded, with 'Locations' selected. The main content area is titled 'Location Details' and contains several sections:

- General:** The 'Name' field is populated with 'HG Session Manager'. The 'Notes' field is empty.
- Dial Plan Transparency in Survivable Mode:** The 'Enabled' checkbox is unchecked. The 'Listed Directory Number' and 'Associated CM SIP Entity' fields are empty.
- Overall Managed Bandwidth:** The 'Managed Bandwidth Units' dropdown is set to 'Kbit/sec'. The 'Total Bandwidth' and 'Multimedia Bandwidth' fields are empty. The 'Audio Calls Can Take Multimedia Bandwidth' checkbox is checked.
- Per-Call Bandwidth Parameters:** The 'Maximum Multimedia Bandwidth (Intra-Location)' and 'Maximum Multimedia Bandwidth (Inter-Location)' fields are both set to '1000 Kbit/Sec'. The 'Minimum Multimedia Bandwidth' field is set to '64 Kbit/Sec'. The 'Default Audio Bandwidth' dropdown is set to '80 Kbit/sec'.
- Alarm Threshold:** The 'Overall Alarm Threshold' and 'Multimedia Alarm Threshold' dropdowns are both set to '80 %'. The 'Latency before Overall Alarm Trigger' and 'Latency before Multimedia Alarm Trigger' fields are both set to '5 Minutes'.
- Location Pattern:** The 'Add' and 'Remove' buttons are visible. Below them, there is a table with 0 items. The 'Filter' is set to 'Enable'.

At the bottom right of the form, there are 'Commit' and 'Cancel' buttons.

The following screen shows the **HG Communication Manager** location. This location will be assigned later to the SIP Entity corresponding to Communication Manager.

The screenshot displays the Avaya Aura System Manager 7.0 web interface. The left sidebar shows a navigation menu with options: Routing, Domains, Locations (selected), Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Location Details' and includes a breadcrumb trail: Home / Elements / Routing / Locations. The 'Name' field is set to 'HG Communication Manager'. Below this, there are sections for 'Dial Plan Transparency in Survivable Mode' (with an 'Enabled' checkbox), 'Overall Managed Bandwidth' (with fields for 'Managed Bandwidth Units', 'Total Bandwidth', and 'Multimedia Bandwidth'), 'Per-Call Bandwidth Parameters' (with fields for 'Maximum Multimedia Bandwidth (Intra-Location)', 'Maximum Multimedia Bandwidth (Inter-Location)', 'Minimum Multimedia Bandwidth', and 'Default Audio Bandwidth'), 'Alarm Threshold' (with fields for 'Overall Alarm Threshold', 'Multimedia Alarm Threshold', and latency triggers), and 'Location Pattern' (with an 'Add' button and a table showing 0 items). The interface also includes 'Commit' and 'Cancel' buttons at the top right and bottom right, and a 'Help' link.

The following screen shows the **HG ASBCE** location. This location will be assigned later to the SIP Entity corresponding to the Avaya SBCE.

The screenshot displays the Avaya Aura System Manager 7.0 web interface. The left sidebar contains a navigation menu with options: Routing, Domains, Locations (selected), Adaptations, SIP Entities, Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Location Details' and includes a breadcrumb trail: Home / Elements / Routing / Locations. At the top right, there are 'Commit' and 'Cancel' buttons and a 'Help ?' link. The 'General' section shows the 'Name' field set to 'HG ASBCE' and an empty 'Notes' field. The 'Dial Plan Transparency in Survivable Mode' section has an 'Enabled' checkbox that is unchecked, with fields for 'Listed Directory Number' and 'Associated CM SIP Entity'. The 'Overall Managed Bandwidth' section includes a 'Managed Bandwidth Units' dropdown set to 'Kbit/sec', and fields for 'Total Bandwidth' and 'Multimedia Bandwidth'. The 'Audio Calls Can Take Multimedia Bandwidth' checkbox is checked. The 'Per-Call Bandwidth Parameters' section contains fields for 'Maximum Multimedia Bandwidth (Intra-Location):' (1000 Kbit/Sec), 'Maximum Multimedia Bandwidth (Inter-Location):' (1000 Kbit/Sec), '* Minimum Multimedia Bandwidth:' (64 Kbit/Sec), and '* Default Audio Bandwidth:' (80 Kbit/sec). The 'Alarm Threshold' section has 'Overall Alarm Threshold:' (80 %) and 'Multimedia Alarm Threshold:' (80 %), with '* Latency before Overall Alarm Trigger:' (5 Minutes) and '* Latency before Multimedia Alarm Trigger:' (5 Minutes). The 'Location Pattern' section at the bottom has an 'Add' button, a 'Remove' button, a table with 0 items, a 'Filter: Enable' link, and a table header with 'IP Address Pattern' and 'Notes'. 'Commit' and 'Cancel' buttons are at the bottom right.

6.4. Adaptations

In order to improve interoperability with third party elements, Session Manager 7.0 incorporates the ability to use Adaptation modules to remove specific headers that are either Avaya proprietary or deemed excessive/unnecessary for non-Avaya elements.

For the compliance test, an Adaptation named “CM_Outbound_Header_Removal” was created to block the following headers from outbound messages, before they were forwarded to the Avaya SBCE: Alert-Info, P-Charging-Vector, AV-Global-Session-ID, AV-Correlation-ID, P-AV-Message-id, P-Location, and Endpoint-View. These headers contain private information from the enterprise, which should not be propagated outside of the enterprise boundaries. They also add unnecessary size to outbound messages, while they have no significance to the service provider.

Navigate to **Routing → Adaptations** in the left-hand navigation pane and click the **New** button in the right pane (not shown). In the new right pane that appears (shown below), fill in the following:

- **Adaptation Name:** Enter an appropriate name.
- **Module Name:** Select the *DigitConversionAdapter* option.
- **Module Parameter Type:** Select *Name-Value Parameter*.

Click **Add** to add the name and value parameters.

- **Name:** Enter *eRHdrs*. This parameter will remove the specified headers from messages in the egress direction.
- **Value:** Enter “*Alert-Info, P-Charging-Vector, AV-Global-Session-ID, AV-Correlation-ID, P-AV-Message-id, P-Location, Endpoint-View*”

The screen below shows the adaptation created for the compliance test. This adaptation will later be applied to the SIP Entity corresponding to the Avaya SBCE. All other fields were left with their default values.

The screenshot displays the Avaya Aura System Manager 7.0 web interface. The left sidebar shows a navigation menu with 'Adaptations' highlighted. The main content area is titled 'Adaptation Details' and includes a 'General' tab. The 'Adaptation Name' is 'CM_Outbound_Header_Removal', the 'Module Name' is 'DigitConversionAdapter', and the 'Module Parameter Type' is 'Name-Value Parameter'. Below this, there is a table for 'Add' and 'Remove' parameters. The table has columns for 'Name' and 'Value'. One entry is visible: 'allhdrs' with a value that includes 'Alert-Info, P-Charging-Vector, AV-Global-Session-ID, AV-Correlation-ID, P-AV-Message-id, P-'. Below the table, there are fields for 'Egress URI Parameters' and 'Notes'. At the bottom, there are two sections for 'Digit Conversion for Incoming Calls to SM' and 'Digit Conversion for Outgoing Calls from SM', each with a table for 'Add' and 'Remove' items. The tables have columns for 'Matching Pattern', 'Min', 'Max', 'Phone Context', 'Delete Digits', 'Insert Digits', 'Address to modify', 'Adaptation Data', and 'Notes'. The 'Commit' and 'Cancel' buttons are at the bottom right.

6.5. SIP Entities

A SIP Entity must be added for Session Manager and for each SIP telephony system connected to it, which includes Communication Manager and the Avaya SBCE. Navigate to **Routing → SIP Entities** in the left-hand navigation pane and click on the **New** button in the right pane (not shown).

In the **General** section, enter the following values. Use default values for all remaining fields:

- **Name:** Enter a descriptive name.
- **FQDN or IP Address:** Enter the FQDN or IP address of the SIP Entity interface that is used for SIP signaling.
- **Type:** Enter ***Session Manager*** for Session Manager, ***CM*** for Communication Manager and ***SIP Trunk*** (or ***Other***) for the Avaya SBCE.
- **Adaptation:** This field is only present if **Type** is not set to **Session Manager**. If applicable, select the **Adaptation Name**.
- **Location:** Select one of the locations defined previously.
- **Time Zone:** Select the time zone for the location above.

To define the ports used by Session Manager, scroll down to the **Port** section of the **SIP Entity Details** screen. This section is only present for **Session Manager** SIP entities.

In the **Port** section, click **Add** and enter the following values. Use default values for all remaining fields:

- **Port:** Port number on which the Session Manager will listen for SIP requests.
- **Protocol:** Transport protocol to be used to send SIP requests.
- **Default Domain:** The domain used for the enterprise.
- Click **Commit** to save.

The following screen shows the addition of the Session Manager SIP entity. The name **HG Session Manager**, the IP address of the Session Manager signaling interface, the Location **HG Session Manager** created in **Section 6.3** and the **Time Zone** were used.

For the compliance test, only two Ports were used:

- **5060** with **TCP** for connecting to the Avaya SBCE.
- **5070** with **TCP** for connecting to Communication Manager.

The following screen shows the addition of the SIP entity for the Avaya SBCE.

The name **HG ASBCE**, the inside IP address of the Avaya SBCE, the **Type** of **Other**, the adaptation **CM_Outbound_Header_Removal** created in **Section 6.4**, the location **HG ASBCE** created in **Section 6.3** and the **Time Zone** were used.

Note: **Type: Other** was used during the testing; **SIP Trunk** could have been used instead.

The screenshot displays the Avaya Aura System Manager 7.0 web interface. The left sidebar contains a navigation menu with options: Home, Routing, Domains, Locations, Adaptations, SIP Entities (selected), Entity Links, Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'SIP Entity Details' and includes a breadcrumb trail: Home / Elements / Routing / SIP Entities. The form is divided into several sections:
 - **General**: Includes fields for Name (HG ASBCE), FQDN or IP Address (172.16.5.71), Type (Other), and Notes (HG ASBCE).
 - **Adaptation**: Includes a dropdown for Adaptation (CM_Outbound_Header_Removal), a dropdown for Location (HG ASBCE), and a dropdown for Time Zone (America/New_York).
 - **SIP Timer B/F (in seconds)**: A text field with the value 4.
 - **Credential name**: A text field.
 - **Securable**: A checkbox.
 - **Call Detail Recording**: A dropdown menu set to none.
 - **CommProfile Type Preference**: A dropdown menu.
 - **Loop Detection**: A section with a dropdown for Loop Detection Mode set to Off.
 - **SIP Link Monitoring**: A section with a dropdown for SIP Link Monitoring set to Use Session Manager Configuration.
 - **Supports Call Admission Control**: A checkbox.
 - **Shared Bandwidth Manager**: A checkbox.
 - **Primary Session Manager Bandwidth Association**: A dropdown menu.
 - **Backup Session Manager Bandwidth Association**: A dropdown menu.
 - **SIP Responses to an OPTIONS Request**: A section with an 'Add' button, a 'Remove' button, and a table with columns for Response Code & Reason Phrase, Mark Entity Up/Down, and Notes. The table currently shows 0 items.
 At the bottom right of the form are 'Commit' and 'Cancel' buttons.

6.6. Entity Links

A SIP trunk between Session Manager and a telephony system is described by an Entity Link. Two entity links were created; one to Communication Manager and one to the Avaya SBCE, to be used only for Service Provider traffic. To add an entity link, navigate to **Routing → Entity Links** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). Fill in the following fields in the new row that is displayed:

- **Name:** Enter a descriptive name.
- **SIP Entity 1:** Select the Session Manager.
- **Protocol:** Select the transport protocol used for this link. For Communication Manager this was matched to the **Transport Method** defined on the Communication Manager signaling group in **Section 5.6**. For the Avaya SBCE, this was matched to the **Transport** defined on the **Server Configuration** for Session Manager (Call Server) in **Section 7.2.4**.
- **Port:** Port number on which Session Manager will receive SIP requests from the far-end. For Communication Manager, this was matched to the **Far-end Listen Port** defined on the Communication Manager signaling group in **Section 5.6**. For the Avaya SBCE, this was matched to the **Port** defined on the **Server Configuration** for Session Manager (Call Server) in **Section 7.2.4**.
- **SIP Entity 2:** Select the name of the other system. For Communication Manager or the Avaya SBCE select the respective SIP Entity defined in **Section 6.5**.
- **Port:** Port number on which the other system will receive SIP requests from Session Manager. For Communication Manager, this was matched to the **Near-end Listen Port** defined on the Communication Manager signaling group in **Section 5.6**. For the Avaya SBCE, this was matched to the **TCP Port** defined for the private **Signaling Interface** on the Avaya SBCE in **Section 7.4.3**.
- **Connection Policy:** Select *Trusted*.
- Click **Commit** to save.

The following screens illustrate the entity links to Communication Manager and to the Avaya SBCE. It should be noted that in a customer environment the entity link to Communication Manager would normally use TLS. For the compliance test, TCP was used to aid in troubleshooting since the signaling traffic is not encrypted.

The following screen shows the entity link to Communication Manager:

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left sidebar contains a menu with options: Routing, Domains, Locations, Adaptations, SIP Entities, Entity Links (selected), Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Entity Links' and shows a table with one item. The table has columns: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, DNS Override, Port, and Connection Policy. The row shows: *HG Session Manager, *HG Session Manager, TCP, *5070, *HG CM Trunk 2, [checked], *5070, and trusted. There are 'Commit' and 'Cancel' buttons at the top right and bottom right of the table area.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	DNS Override	Port	Connection Policy
*HG Session Manager	*HG Session Manager	TCP	*5070	*HG CM Trunk 2	<input checked="" type="checkbox"/>	*5070	trusted

The following screen shows the entity link to the Avaya SBCE:

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left sidebar contains a menu with options: Routing, Domains, Locations, Adaptations, SIP Entities, Entity Links (selected), Time Ranges, Routing Policies, Dial Patterns, Regular Expressions, and Defaults. The main content area is titled 'Entity Links' and shows a table with one item. The table has columns: Name, SIP Entity 1, Protocol, Port, SIP Entity 2, DNS Override, Port, and Connection Policy. The row shows: *HG Session Manager, *HG Session Manager, TCP, *5060, *HG ASBCE, [checked], *5060, and trusted. There are 'Commit' and 'Cancel' buttons at the top right and bottom right of the table area.

Name	SIP Entity 1	Protocol	Port	SIP Entity 2	DNS Override	Port	Connection Policy
*HG Session Manager	*HG Session Manager	TCP	*5060	*HG ASBCE	<input checked="" type="checkbox"/>	*5060	trusted

The following screen shows the list of the newly added entity links. Note that only the highlighted entity links were created for the compliance test, and are the ones relevant to these Application Notes.

6.7. Routing Policies

Routing Policies describe the conditions under which calls are routed to the SIP entities specified in **Section 6.5**. Two routing policies must be added: one for Communication Manager and one for the Avaya SBCE. To add a routing policy, navigate to **Routing → Routing Policies** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). The following screen is displayed. Fill in the following:

In the **General** section, enter the following values. Use default values for all remaining fields:

- **Name:** Enter a descriptive name.
- **Notes:** Add a brief description (optional).

In the **SIP Entity as Destination** section, click **Select**. The **SIP Entity List** page opens (not shown). Select the appropriate SIP entity to which this routing policy applies and click **Select**. The selected SIP entity displays on the **Routing Policy Details** page as shown below. Use default values for remaining fields.

- Click **Commit** to save.

The following screen shows the routing policy for Communication Manager:

The screenshot shows the Avaya Aura System Manager 7.0 interface. The left navigation pane has 'Routing Policies' selected. The main content area is titled 'Routing Policy Details' and has 'Commit' and 'Cancel' buttons. The 'General' section contains the following fields:

- Name:** To HG CM Trunk 2
- Disabled:** ☐
- Retries:** 0
- Notes:** Inbound calls to HG CM Trunk 2

The 'SIP Entity as Destination' section contains a table with one entry:

Name	FQDN or IP Address	Type	Notes
HG CM Trunk 2	172.16.5.201	CM	For Service Provider Calls

The following screen shows the routing policy for the Avaya SBCE:

The screenshot displays the Avaya Aura System Manager 7.0 interface. The left-hand navigation pane shows the 'Routing' menu expanded, with 'Routing Policies' selected. The main content area is titled 'Routing Policy Details' and includes a 'Commit' button and a 'Cancel' button. The 'General' tab is active, showing the following fields:

- Name:** To HG ASBCE
- Disabled:** ☐
- Retries:** 0
- Notes:** For outbound calls to Service Pro

Below the 'General' tab is the 'SIP Entity as Destination' section, which includes a 'Select' button and a table with the following data:

Name	FQDN or IP Address	Type	Notes
HG ASBCE	172.16.3.71	Other	HG ASBCE

6.8. Dial Patterns

Dial Patterns are needed to route calls through Session Manager. For the compliance test, dial patterns were needed to route calls from Communication Manager to Claro and vice versa. Dial patterns define which route policy will be selected for a particular call based on the dialed digits, destination domain and originating location. To add a dial pattern, navigate to **Routing → Dial Patterns** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). Fill in the following, as shown in the following screens:

In the **General** section, enter the following values. Use default values for all remaining fields:

- **Pattern:** Enter a dial string that will be matched against the Request-URI of the call.
- **Min:** Enter a minimum length used in the match criteria.
- **Max:** Enter a maximum length used in the match criteria.
- **SIP Domain:** Enter the destination domain used in the match criteria.
- **Notes:** Add a brief description (optional).

In the **Originating Locations and Routing Policies** section, click **Add**. From the **Originating Locations and Routing Policy List** that appears (not shown), select the appropriate originating location for use in the match criteria. Lastly, select the routing policy from the list that will be used to route all calls that match the specified criteria. Click **Select**.

- Click **Commit** to save.

Examples of dial patterns used for the compliance testing are shown below.

The first example shows dial pattern **1**, with destination SIP Domain of **-ALL-**, Originating Location Name **HG Communication Manager** and Routing Policy name **To HG ASBCE**. This dial pattern was used for outbound calls to the PSTN.

Note: The SIP Domain was set to **-ALL-** since dial pattern 1 is shared among multiple SIP Domains in the Avaya lab, SIP Domain **Avaya.lab.com** could have been used instead.

Select : All, None

The following dial pattern used for the compliance testing was for inbound calls to the enterprise. It uses dial pattern **+1123** matching the “+” and the first four digits sent by Claro on inbound calls to the enterprise. The pattern also matches the “+” and the first four digits of DID numbers assigned to Communication Manager in **Section 5.9 Inbound Routing**. This dial pattern was configured with the destination SIP Domain of *avaya.lab.com*, Originating Location Name **HG ASBCE**, and Routing Policy name **To HG CM Trunk 2**.

Note: The same procedure should be followed to add other required dial patterns.

6.9. Add/View Avaya Aura® Session Manager

The creation of a Session Manager element provides the linkage between System Manager and Session Manager. This was most likely done as part of the initial Session Manager installation. To add Session Manager, navigate to **Elements → Session Manager → Session Manager Administration** in the left-hand navigation pane and click on the **New** button in the right pane (not shown). If Session Manager already exists, click **View** (not shown) to view the configuration. Enter/verify the data as described below and shown in the following screen:

In the **General** section, enter the following values:

- **SIP Entity Name:** Select the SIP Entity created for Session Manager.
- **Description:** Add a brief description (optional).
- **Management Access Point Host Name/IP:** Enter the IP address of the Session Manager management interface.

In the **Security Module** section, enter the following values:

- **SIP Entity IP Address:** Should be filled in automatically based on the SIP Entity Name. Otherwise, enter IP address of the Session Manager signaling interface.
- **Network Mask:** Enter the network mask corresponding to the IP address of the Session Manager signaling interface.
- **Default Gateway:** Enter the IP address of the default gateway for Session Manager.

Use default values for the remaining fields.

- Click **Save** (not shown).

The screen below shows the Session Manager values used for the compliance test.

*SIP Firewall Configuration: Rule Set for HG Session Manager

7. Configure Avaya Session Border Controller for Enterprise

This section describes the required configuration of the Avaya SBCE to connect to Claro's SIP Trunking service.

It is assumed that the Avaya SBCE was provisioned and is ready to be used; the configuration shown here is accomplished using the Avaya SBCE web interface.

Note: In the following pages, and for brevity in these Application Notes, not every provisioning step will have a screenshot associated with it. Some of the default information in the screenshots that follow may have been cut out (not included) for brevity.

7.1. Log in Avaya SBCE

Use a web browser to access the Avaya SBCE web interface, enter `https://<ip-addr>/sbc` in the address field of the web browser, where `<ip-addr>` is the management IP address of the Avaya SBCE.

Enter the appropriate credentials and then click **Log In**.

The screenshot displays the login interface for the Avaya Session Border Controller for Enterprise. On the left, the Avaya logo is shown in red, with the text "Session Border Controller for Enterprise" below it. To the right, under the heading "Log In", there are input fields for "Username:" and "Password:". The username field contains the text "username". Below these fields is a "Log In" button. To the right of the login fields, there is a block of legal disclaimer text. At the bottom right, the copyright notice "© 2011 - 2015 Avaya Inc. All rights reserved." is visible.

To view the system information that has been configured during installation, navigate to **System Management**. A list of installed devices is shown in the right pane. In the compliance testing, a single Device Name **Avaya SBCE** was already added.

The screenshot shows the Avaya Session Border Controller for Enterprise System Management page. The top navigation bar is the same as the dashboard. The main header displays "Session Border Controller for Enterprise" and the Avaya logo. On the left, the sidebar menu lists various sections, with "System Management" highlighted. The main content area is titled "System Management" and contains a tabbed interface with "Devices", "Updates", "SSL VPN", and "Licensing". The "Devices" tab is active, showing a table of installed devices.

Device Name	Management IP	Version	Status				
Avaya SBCE	192.168.1.1	7.0.0-21-6602	Commissioned	Reboot	Shutdown	Restart Application	View Edit Uninstall

To view the network configuration assigned to the Avaya SBCE, click **View** as shown on the previous screen. The **System Information** window is displayed as shown below.

The **System Information** screen shows **Network Configuration**, **DNS Configuration** and **Management IP** information provided during installation and corresponds to **Figure 1**. The **Box Type** was set to **SIP** and the **Deployment Mode** was set to **Proxy**. Default values were used for all other fields.

System Information: Avaya SBCE

General Configuration		Device Configuration		License Allocation	
Appliance Name	Avaya SBCE	HA Mode	No	Standard Sessions Requested: 2000	2000
Box Type	SIP	Two Bypass Mode	No	Advanced Sessions Requested: 2000	2000
Deployment Mode	Proxy			Scopia Video Sessions Requested: 500	500
				CES Sessions Requested: 0	0
				Encryption	<input checked="" type="checkbox"/>

Network Configuration				
IP	Public IP	Netmask	Gateway	Interface
172.16.5.71	172.16.5.71	255.255.255.0	172.16.5.200	A1
172.16.5.199	172.16.5.199	255.255.255.0	172.16.5.200	A1

DNS Configuration		Management IP(s)	
Primary DNS	172.16.5.102	IP	172.16.5.71
Secondary DNS			
DNS Location	DMZ		
DNS Client IP	172.16.5.71		

On the previous screen, note that the **A1** interface corresponds to the inside interface (Private Network side) and **B1** interface corresponds to the outside interface (Public Network side) of the Avaya SBCE. Since a VPN connection was used with this solution to connect Claro's network to the enterprise network, the **A1** interface was used for access to the private enterprise network and to route calls to Claro's network across the VPN tunnel. In this solution, the **B1** interface was used for remote workers access to the enterprise. The configuration required for the **B1** interface is not discussed in this document. Refer to **Figure 1** for the IP addresses for both the A1 and B1 interfaces on the Avaya SBCE.

When a VPN connection is not used, the **B1** interface is normally used for remote workers access to the private network as well as to route calls to the Service Provider across the public Internet.

The management IP was blurred out for security reasons. The IP addresses used for the remote worker configuration was also blurred out since the remote worker configuration is beyond the scope of these Application Notes and is not discussed in these Application Notes.

IMPORTANT! – During the Avaya SBCE installation, the Management interface, (labeled “M1”), of the Avaya SBCE must be provisioned on a different subnet than either of the Avaya SBCE private and public network interfaces (e.g., A1 and B1). If this is not the case, contact your Avaya representative to have this resolved.

7.2. Global Profiles

The Global Profiles Menu, on the left navigation pane, allows the configuration of parameters across all Avaya SBCE appliances.

7.2.1. Server Interworking Avaya-SM

Interworking Profile features are configured to facilitate interoperability of implementations between enterprise SIP-enabled solutions and different SIP trunk Service Providers.

Several profiles have been already pre-defined and they populate the list under **Interworking Profiles** on the screen on the next page. If a different profile is needed, a new Interworking Profile can be created, or an existing default profile can be modified or “cloned”. Since directly modifying a default profile is generally not recommended, for the test configuration the default **avaya-ru** profile was duplicated, or “cloned”, and then modified to meet specific requirements for the enterprise SIP-enabled solution.

On the left navigation pane, select **Global Profiles → Server Interworking**. From the **Interworking Profiles** list, select **avaya-ru**. Click **Clone** on top right of the screen.

Enter the new profile name in the **Clone Name** field, the name of **Avaya-SM** was chosen in this example. Click **Finish** (not shown).

For the newly created **Avaya-SM** profile, click **Edit** (not shown) at the bottom of the **General** tab:

- Check **T.38 Support**.
- Leave other fields with their default values.
- Click **Finish** in the **Editing Profile** window.

The following screen capture shows the **General** tab of the newly created **Avaya-SM** Server Interworking Profile.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the Avaya logo on the right.

On the left is a sidebar menu with categories like Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, Domain DoS, Server Interworking (highlighted), Media Forking, Routing, Server Configuration, Topology Hiding, Signaling Manipulation, URI Groups, SNMP Traps, Time of Day Rules, PPM Services, Domain Policies, TLS Management, and Device Specific Settings.

The main content area is titled "Interworking Profiles: Avaya-SM". It features a list of profiles on the left: cs2100, avaya-ru, OCS-Edge-Server, cisco-cdm, cups, Spera-Halo, OCS-FrontEnd-Server, **Avaya-SM** (highlighted), SIP-General, Avaya-CS1000, Avaya-SPO, and Avaya-CM. An "Add" button is above this list.

The "Avaya-SM" profile is selected, and its configuration is shown in the "General" tab. The tab bar includes General, Timers, Privacy, URI Manipulation, Header Manipulation, and Advanced. The General tab contains a table of settings:

Setting	Value
Hold Support	NONE
180 Handling	None
181 Handling	None
182 Handling	None
183 Handling	None
Refer Handling	No
URI Group	None
Send Hold	No
Delayed Offer	No
Box Handling	No
Diversion Header Support	No
Delayed SDP Handling	No
Re-Invite Handling	No
Prack Handling	No
Allow 18X SDP	No
T.38 Support	Yes
URI Scheme	SIP
Via Header Format	RFC3261

The following screen capture shows the **Advanced** tab of the newly created **Avaya-SM** Server Interworking Profile.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header shows the product name and the Avaya logo. A left-hand navigation menu lists various system management options, with 'Global Profiles' expanded to show 'Server' and 'Interworking' sub-items. The main content area is titled 'Interworking Profiles: Avaya-SM' and features a list of profiles on the left, including 'cs2100', 'avaya-cu', 'OCS-Edge-Server', 'cisco-com', 'cups', 'Spera-Halo', 'OCS-FrontEnd-Server', 'Avaya-SM' (highlighted), 'SP-General', 'Avaya-CS1000', 'Avaya-IPO', and 'Avaya-CM'. The 'Avaya-SM' profile is selected, and its configuration is shown in the 'Advanced' tab. The configuration includes a table for 'Record Routes' with columns for 'Record Routes' and 'Both Sides'. The table contains the following data:

Record Routes	Both Sides
Include End Point IP for Context Lookup	Yes
Extensions	Avaya
Diversion Manipulation	No
Has Remote SBC	Yes
Route Response on Via Port	No

Below the table is a section for 'DTMF' with a single row: 'DTMF Support' set to 'None'. An 'Edit' button is located at the bottom right of the configuration area.

7.2.2. Server Interworking SP-General

A second Server Interworking profile named **SP-General** was created for the Service Provider.

On the left navigation pane, select **Global Profiles** → **Server Interworking**. From the **Interworking Profiles** list, select **Add**.

Enter the new profile name (not shown), the name of **SP-General** was chosen in this example. Click **Next**:

On the **General** tab:

- Check **T.38 Support**.
- Leave other fields with their default values.
- Click **Next** until the Advanced tab is reached, check **Both Sides** then click **Finish** on the Advanced tab.

The following screen capture shows the **General** tab of the newly created **SP-General** Server Interworking Profile.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The left navigation pane shows the hierarchy: Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles (selected), and its sub-items: Domain DoS, Server Interworking (selected), Media Forking, Routing, Server Configuration, Topology Hiding, Signaling Manipulation, URI Groups, SNMP Traps, Time of Day Rules, PPM Services, Domain Policies, TLS Management, and Device Specific Settings. The main content area is titled 'Interworking Profiles: SP-General' and includes an 'Add' button. Below this is a list of existing profiles: cs2100, avaya-cu, OCS-Edge-Server, cisco-cdm, ngs, Sipera-Halo, OCS-FrontEnd-Server, Avaya-SM, SP-General (highlighted), Avaya-CS1000, Avaya-IPD, and Avaya-CM. The 'General' tab is active, showing a table of configuration options. The 'T.38 Support' option is checked and highlighted with a red box. Other options include Hold Support, 100 Handling, 181 Handling, 182 Handling, 183 Handling, Refer Handling, URI Group, Send Hold, Delayed Offer, 3xx Handling, Diversion Header Support, Delayed SDP Handling, Re-Invite Handling, Prack Handling, Allow tEX SDP, URI Scheme, and Via Header Format.

General	Timers	Privacy	URI Manipulation	Header Manipulation	Advanced
Hold Support					NONE
100 Handling					None
181 Handling					None
182 Handling					None
183 Handling					None
Refer Handling					No
URI Group					None
Send Hold					No
Delayed Offer					No
3xx Handling					No
Diversion Header Support					No
Delayed SDP Handling					No
Re-Invite Handling					No
Prack Handling					No
Allow tEX SDP					No
T.38 Support					Yes
URI Scheme					SIP
Via Header Format					RFC3261

The following screen capture shows the **Advanced** tab of the newly created **SP-General** Server Interworking Profile.

7.2.3. Signaling Manipulation

The Signaling Manipulation feature of the Avaya SBCE allows an administrator to perform granular header manipulations on the headers of the SIP messages, which sometimes is not possible by direct configuration on the web interface. This ability to configure header manipulation in such a highly flexible manner is achieved by the use of a proprietary scripting language called SigMa.

The script can be created externally as a regular text file and imported in the Signaling Manipulation screen, or they can be written directly in the page using the embedded Sigma Editor. In the reference configuration, the Editor was used. A detailed description of the structure of the SigMa scripting language and details on its use is beyond the scope of these Application Notes. Consult [6] in the **References** section for more information on this topic.

Sigma scripts were created during the compliance test to correct the following interoperability issues (refer to **Section 2.2**):

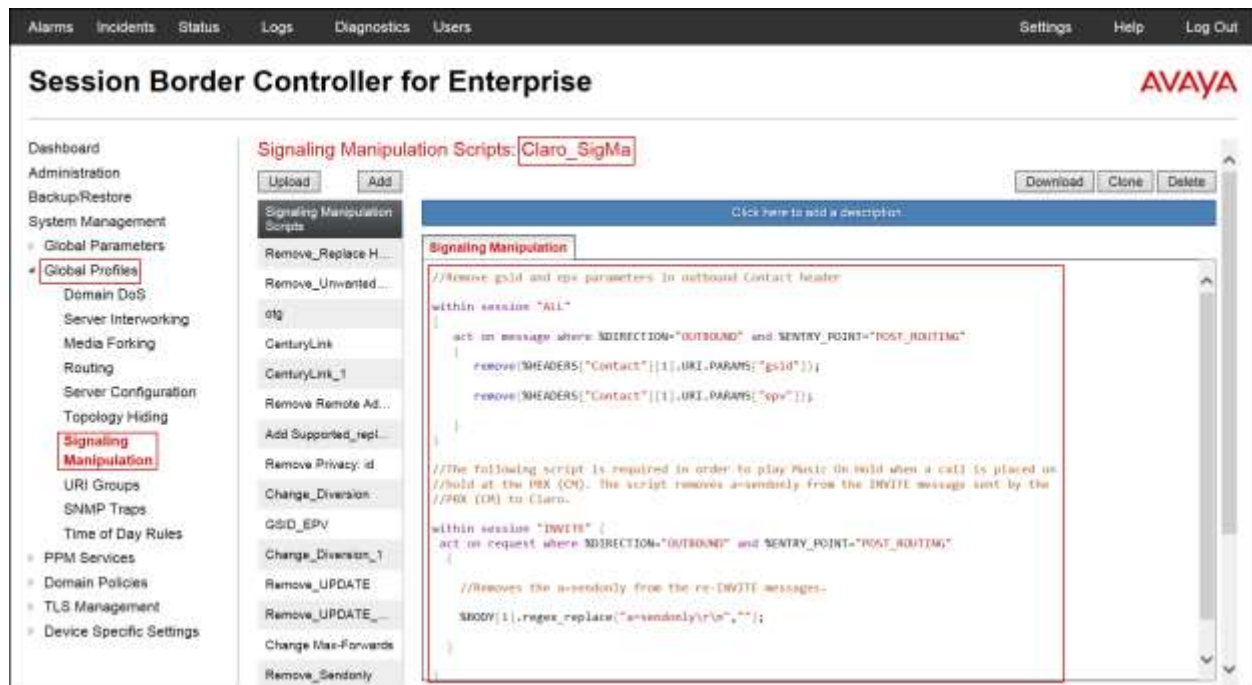

- **Remove unwanted headers:** Remove the “gsid” and “epv” parameters from outbound “Contact” headers. These parameters have no significance to the service provider and add unnecessary size to the outbound messages.
- **Music on hold:** When calls from/to the PSTN were placed on-hold by Communication Manager users, the PSTN users did not hear Music while on-hold. A SigMa script was created to remove the “sendonly” message Communication Manager includes in the SDP of re-INVITEs when calls from/to the PSTN are placed on-hold, this allowed the PSTN users to hear Music while on-hold. The script was latter applied to the Service

Provider side of the server configuration profile (refer to **Section 7.2.4**). The script was included under the **Claro_SigMa** script shown below.

On the left navigation pane, select **Global Profiles** → **Signaling Manipulation**. From the **Signaling Manipulation Scripts** list, select **Add**.

- For **Title** enter a name, the name **Claro_SigMa** was chosen in this example.
- Copy the complete script from **Appendix A**.
- Click **Save**.

The following screen capture shows the **Claro_SigMa** script after it was added.

7.2.4. Server Configuration

Server Profiles should be created for the Avaya SBCE's two peers, the Call Server (Session Manager) and the Trunk Server which is the SIP Proxy at the Service Provider's network.

To add the profile for the Call Server, from the **Global Profiles** menu on the left-hand navigation pane, select **Server Configuration**. Click **Add** in the **Server Profiles** section and enter the profile name: *Session Manager*.

In the **Add Server Configuration Profile** window:

- **Server Type:** select *Call Server*.
- **IP Address / FQDN:** *172.16.5.32* (IP Address of the Session Manager SIP entity).
- **Port:** *5060* (This port must match the port number defined in **Section 6.6**).
- **Transports:** Select *TCP*.
- Click **Next**.

IP Address / FQDN	Port	Transport
172.16.5.32	5060	TCP

- Click **Next** in the **Add Server Configuration Profile - Authentication** window (not shown).
- Click **Next** in the **Add Server Configuration Profile - Heartbeat** window (not shown).

In the **Add Server Configuration Profile - Advanced** window:

- Check **Enable Grooming**.
- Select **Avaya-SM** from the **Interworking Profile** drop down menu.
- Leave the **Signaling Manipulation Script** at the default **None**.
- Click **Finish**.

Add Server Configuration Profile - Advanced

The following screen capture shows the **Advanced** tab of the newly created **Session Manager** Server Profile.

To add the profile for the Trunk Server, from the **Server Configuration** screen, click **Add** in the **Server Profiles** section and enter the profile name: **Service Provider**.

In the **Add Server Configuration Profile** window

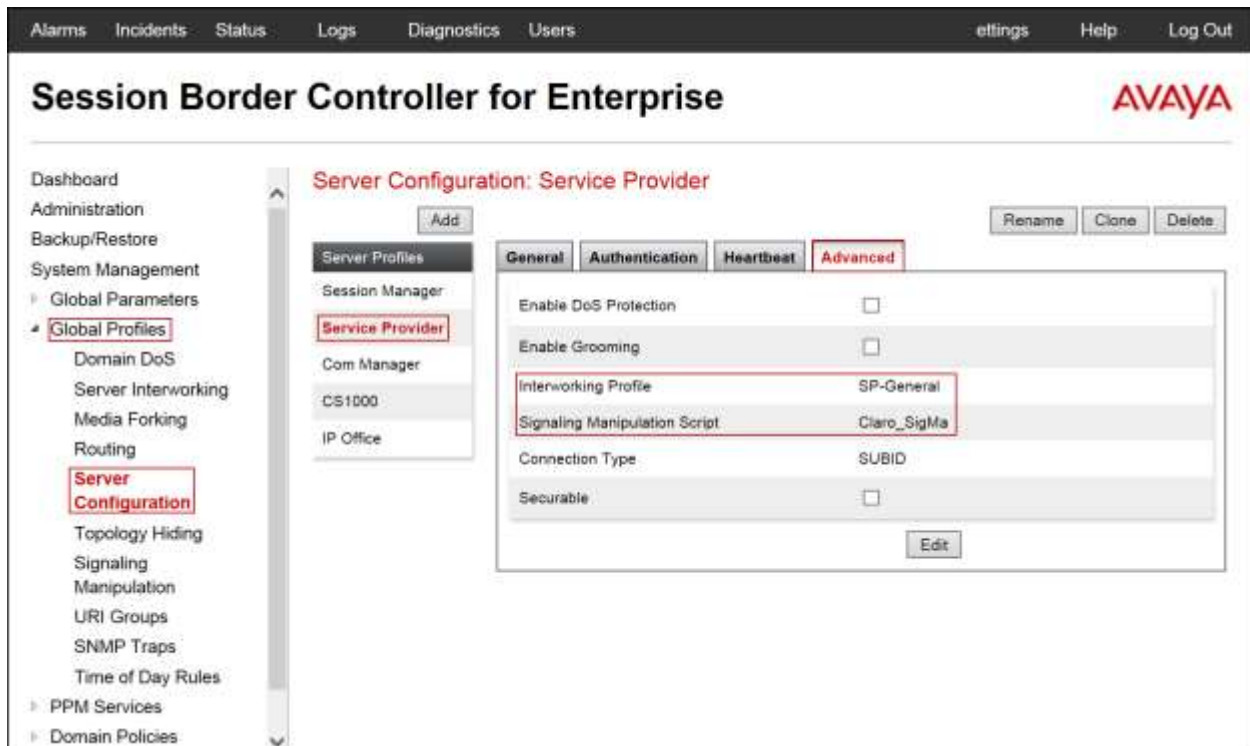

- **Server Type:** select **Trunk Server**.
- **IP Address/FQDN:** **172.31.20.16** (Service Provider's SIP Proxy IP address).
- **Port:** **5060**.
- **Transports:** Select **UDP**.
- Click **Next**.

- Click **Next** in the **Add Server Configuration Profile - Authentication** window (not shown).
- Click **Next** in the **Add Server Configuration Profile - Heartbeat** window (not shown).
In the **Add Server Configuration Profile - Advanced** window:
- Select **SP-General** from the **Interworking Profile**.
- Select **Claro_SigMa** from the **Signaling Manipulation Script**, script created in **Section 7.2.3**.
- Click **Finish**.

The following screen capture shows the **General** tab of the newly created **Service Provider** Server Configuration Profile.

The following screen capture shows the **Advanced** tab of the newly created **Service Provider** Server Configuration Profile.

7.2.5. Routing Profiles

Routing profiles define a specific set of routing criteria that are used, in conjunction with other types of domain policies, to determine the route that SIP packets should follow to arrive at their intended destination.

Two Routing profiles were created; one for inbound calls, with Session Manager as the destination, and the second one for outbound calls, which are sent to the service provider.

To create the inbound route, from the **Global Profiles** menu on the left-hand side:

- Select **Routing**.
- Click **Add** in the **Routing Profiles** section.
- Enter Profile Name: **Route_to_SM**.
- Click **Next**.

On the **Routing Profile** screen complete the following:

- Click on the **Add** button to add a **Next-Hop Address**.
- **Priority / Weight: 1**
- **Server Configuration:** Select **Session Manager**.
- The **Next Hop Address** is populated automatically with **172.16.5.32:5060 (TCP)** (Session Manager IP address, Port and Transport).
- Click **Finish**.

The screenshot shows the 'Routing Profile' configuration window. It includes fields for 'URI Group' (set to '*'), 'Time of Day' (set to 'default'), 'Load Balancing' (set to 'Priority'), 'NAPTR' (unchecked), 'Transport' (set to 'None'), 'Next Hop Priority' (checked), 'Next Hop In-Dialog' (unchecked), and 'Ignore Route Header' (unchecked). An 'Add' button is located to the right of these settings. Below is a table with the following data:

Priority / Weight	Server Configuration	Next Hop Address	Transport
1	Session Manager	172.16.5.32:5060 (TCP)	None

The 'Next Hop Address' field in the table is highlighted with a red box. At the bottom of the window are 'Back' and 'Finish' buttons.

The following screen capture shows the newly created **Route_to_SM** Routing Profile.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header shows the product name and the Avaya logo. A left-hand navigation menu lists various system management options, with 'Global Profiles' expanded and 'Routing' highlighted. The main content area is titled 'Routing Profiles: Route_to_SM' and features an 'Add' button. Below this, a list of routing profiles is shown, with 'Route_to_SM' selected. The configuration details for 'Route_to_SM' are displayed, including a table with columns for Priority, URI Group, Time of Day, Load Balancing, Next Hop Address, and Transport. The table contains one entry with Priority 1, URI Group *, Time of Day default, Load Balancing Priority, Next Hop Address 172.16.5.32, and Transport TCP. There are also buttons for 'Rename', 'Clone', 'Delete', 'Update Priority', and 'Add'.

7.2.6. Topology Hiding

Topology Hiding is a security feature which allows changing several parameters of the SIP packets, preventing private enterprise network information from being propagated to the untrusted public network.

Topology Hiding can also be used as an interoperability tool to adapt the host portion in SIP headers like To, From, Request-URI, Via, Record-Route and SDP to the IP addresses or domains expected by Session Manager and the SIP trunk Service Provider, allowing the call to be accepted in each case.

For the compliance test, only the minimum configuration required to achieve interoperability on the SIP trunk was performed. Additional steps can be taken in this section to further mask the information that is sent from the enterprise to the public network.

To add the Topology Hiding profile in the enterprise direction, select **Topology Hiding** from the **Global Profiles** menu on the left-hand side:

- Select the **default** profile in the **Topology Hiding Profiles** list, then click **Clone** on top right of the screen.
- Enter the **Profile Name: *Session_Manager***.
- Click **Finish**.
- Click **Edit** on the newly added **Session_Manager** Topology Hiding profile.
- For **Request-Line** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**; enter the domain name for the Enterprise (***avaya.lab.com***) under **Overwrite Value**.
- For **From** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**, enter the domain name for the enterprise (***avaya.lab.com***) under **Overwrite Value**.
- For **To** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**, enter the domain name for the Enterprise (***avaya.lab.com***) under **Overwrite Value**.

Header	Criteria	Replace Action	Overwrite Value	
From	IP/Domain	Overwrite	avaya.lab.com	Delete
Via	IP/Domain	Auto		Delete
Record-Route	IP/Domain	Auto		Delete
Request-Line	IP/Domain	Overwrite	avaya.lab.com	Delete
To	IP/Domain	Overwrite	avaya.lab.com	Delete
SDP	IP/Domain	Auto		Delete
Refer-To	IP/Domain	Auto		Delete
Referred-By	IP/Domain	Auto		Delete

Finish

The following screen capture shows the newly created **Session_Manager** Topology Hiding Profile.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header shows the product name and the Avaya logo. On the left, a sidebar menu lists various configuration categories, with 'Global Profiles' and 'Topology Hiding' highlighted. The main content area is titled 'Topology Hiding Profiles: Session_Manager' and features an 'Add' button, a list of existing profiles (default, cisco_th_profile, Session_Manager, Service_Provider, Com Manager, CS1000, IP Office), and a table for configuring the 'Session_Manager' profile. The table has columns for Header, Criteria, Replace Action, and Overwrite Value. The 'Session_Manager' profile is configured with the following settings:

Header	Criteria	Replace Action	Overwrite Value
From	IP/Domain	Overwrite	avaya.lab.com
Via	IP/Domain	Auto	---
Record-Route	IP/Domain	Auto	---
Request-Line	IP/Domain	Overwrite	avaya.lab.com
To	IP/Domain	Overwrite	avaya.lab.com
SDP	IP/Domain	Auto	---
Refer-To	IP/Domain	Auto	---
Referred-By	IP/Domain	Auto	---

An 'Edit' button is located at the bottom right of the table.

To add the Topology Hiding profile in the service provider direction, select **Topology Hiding** from the **Global Profiles** menu on the left-hand side:

- Select the **default** profile in the **Topology Hiding Profiles** list, then click **Clone** on top right of the screen.
- Enter the **Profile Name: *Service_Provider***.
- Click **Finish**.
- Click **Edit** on the newly added **Service_Provider** Topology Hiding profile.
- For **Request-Line** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**; enter the domain name for the service provider (***ims.claro.com.do***) under **Overwrite Value**.
- For **From** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**, enter the domain name for the service provider (***ims.claro.com.do***) under **Overwrite Value**.
- For **To** under **Header**, choose **Overwrite** from the pull-down menu under **Replace Action**, enter the domain name for the service provider (***ims.claro.com.do***) under **Overwrite Value**.

7.3. Domain Policies

Domain Policies allow the configuration of sets of rules designed to control and normalize the behavior of call flows, based upon various criteria of communication sessions originating from or terminating in the enterprise. Domain Policies include rules for Application, Media, Signaling, Security, etc.

Note: The **default-trunk** Application Rule could have been used instead of creating a new one, but a new Application Rule was created to allow changes in the future.

7.3.1. Application Rules

Application Rules define which types of SIP-based Unified Communications (UC) applications the UC-Sec security device will protect: voice, video, and/or Instant Messaging (IM). In addition, Application Rules define the maximum number of concurrent voice and video sessions the network will process in order to prevent resource exhaustion. From the menu on the left-hand side, select **Domain Policies** → **Application Rules**.

- Click on the **Add** button to add a new rule.
- **Rule Name:** enter the name of the profile, e.g., *2000 Sessions*.
- Under **Audio** check *In* and *Out* and set the **Maximum Concurrent Sessions** and **Maximum Sessions Per Endpoint** to recommended values, the value of *2000* was used in the sample configuration.
- Click **Finish**.

Application Type	In	Out	Maximum Concurrent Sessions	Maximum Sessions Per Endpoint
Audio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	2000	2000
Video	<input type="checkbox"/>	<input type="checkbox"/>

7.4. Device Specific Settings

The **Device Specific Settings** allow the management of various device-specific parameters, which determine how a particular device will function when deployed in the network. Specific server parameters, like network and interface settings, as well as call flows, etc. are defined here.

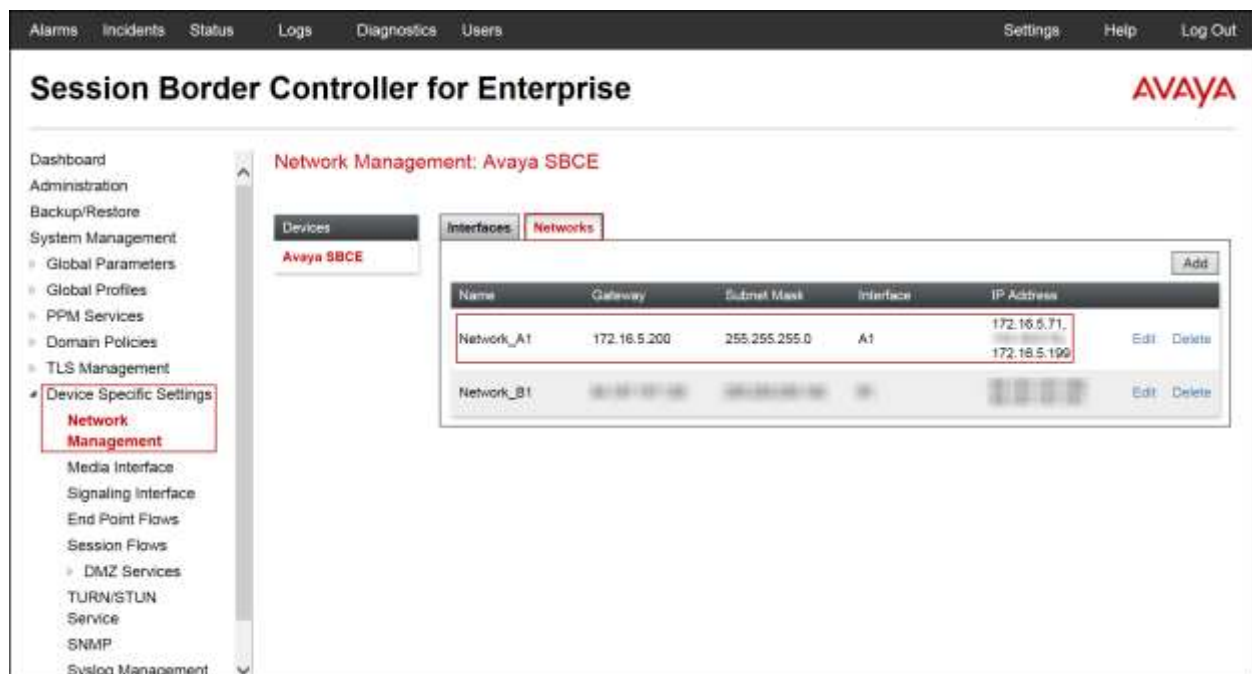

7.4.1. Network Management

The network information should have been previously completed. To verify the network configuration, from the **Device Specific Settings** on the left hand side, select **Network Management**. Select the **Network Configuration** tab.

In the event that changes need to be made to the network configuration information, they can be entered here.

Use **Figure 1** as reference for IP address assignments.

Note: Only the highlighted entity items were created for the compliance test, and are the ones relevant to these Application Notes. Blurred out items are part of the Remote Worker configuration, which is not discussed in this Application Notes.

Note: In cases where the private interface (A1) of the Avaya SBCE is on a different IP subnet as Session Manager or the VPN gateway, it will be required to configure "Gateway Override" under **Device Specific Settings** → **Network Management** → **Networks** in order to separate and route the traffic to the correct destinations (Session Manager or the VPN gateway). In the sample configuration shown, the private interface (A1) of the Avaya SBCE was in the same IP subnet as Session Manager and the VPN gateway, thus configuration of "Gateway Override" was not required.

On the Interface Configuration tab, click the **Toggle** control for interfaces **A1** and **B1** to change the status to **Enabled**. It should be noted that the default state for all interfaces is **disabled**, so it is important to perform this step or the Avaya SBCE will not be able to communicate on any of its interfaces.

The screenshot displays the Avaya Session Border Controller for Enterprise (SBCE) web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the AVAYA logo on the right. The left sidebar contains a navigation menu with categories like Dashboard, Administration, Backup/Restore, System Management, Global Parameters, Global Profiles, PPM Services, Domain Policies, TLS Management, and Device Specific Settings. Under Device Specific Settings, "Network Management" is highlighted. The main content area is titled "Network Management: Avaya SBCE" and features two tabs: "Interfaces" (selected) and "Networks". Below the tabs is a table with columns for Interface Name, VLAN Tag, and Status. The table lists four interfaces: A1 (Enabled), A2 (Disabled), B1 (Enabled), and B2 (Disabled). Red boxes highlight the "Enabled" status for interfaces A1 and B1. An "Add VLAN" button is located in the top right corner of the table area.

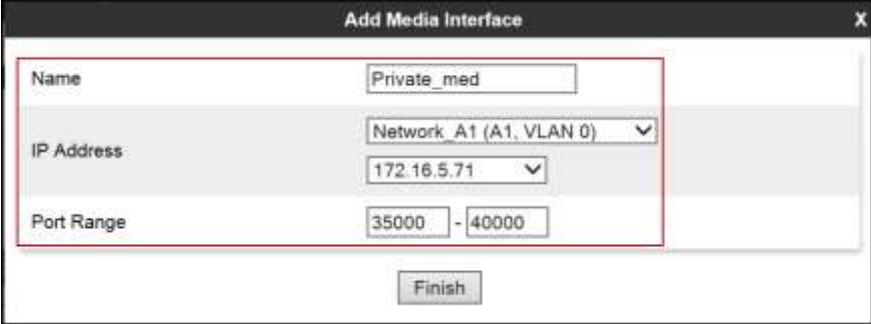

Interface Name	VLAN Tag	Status
A1		Enabled
A2		Disabled
B1		Enabled
B2		Disabled

7.4.2. Media Interface

Media Interfaces were created to adjust the port range assigned to media streams leaving the interfaces of the Avaya SBCE. On the Private and Public interfaces of the Avaya SBCE, port range 35000 to 40000 was used.

From the **Device Specific Settings** menu on the left-hand side, select **Media Interface**. Below is the configuration of the inside, private Media Interface of the Avaya SBCE.

- Select **Add** in the **Media Interface** area.
- **Name:** *Private_med*.
- Under **IP Address** select: **Network_A1 (A1, VLAN 0)**
Select **IP Address:** *172.16.5.71* (Inside or A1 IP Address of the Avaya SBCE, toward Session Manager).
- Enter **Port Range:** *35000-40000*.
- Click **Finish**.

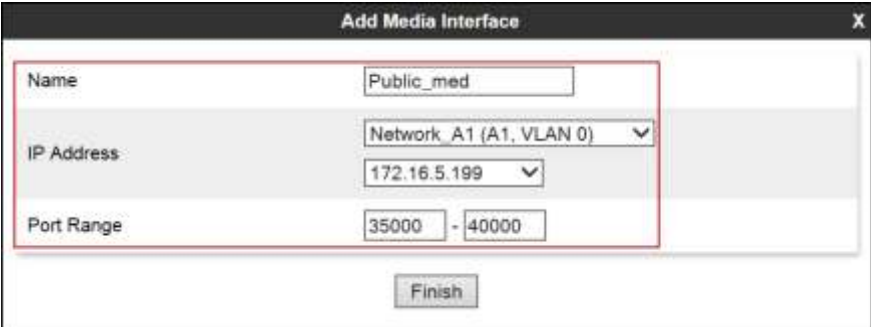

The screenshot shows a window titled "Add Media Interface" with a close button (X) in the top right corner. The window contains the following fields:

- Name:** A text box containing "Private_med".
- IP Address:** A dropdown menu showing "Network_A1 (A1, VLAN 0)". Below it, a text box contains "172.16.5.71".
- Port Range:** Two text boxes containing "35000" and "40000" separated by a hyphen.
- Finish:** A button at the bottom center.

Below is the configuration of the outside, public Media Interface of the Avaya SBCE.

- Select **Add** in the **Media Interface** area.
- **Name:** *Public_med*.
- Under **IP Address** select: **Network_A1 (A1, VLAN 0)**
Select **IP Address:** *172.16.5.199* (IP Address of the Avaya SBCE toward the Service Provider via the VPN Tunnel).
- **Port Range:** *35000-40000*.
- Click **Finish**.

The screenshot shows a window titled "Add Media Interface" with a close button (X) in the top right corner. The window contains the following fields:

- Name:** A text box containing "Public_med".
- IP Address:** A dropdown menu showing "Network_A1 (A1, VLAN 0)". Below it, a text box contains "172.16.5.199".
- Port Range:** Two text boxes containing "35000" and "40000" separated by a hyphen.
- Finish:** A button at the bottom center.

The following screen capture shows the newly created **Media Interfaces**.

The screenshot displays the Avaya Session Border Controller for Enterprise (SBCE) web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the Avaya logo on the right. A left-hand navigation menu lists various system management options, with "Device Specific Settings" expanded and "Media Interface" highlighted. The main content area is titled "Media Interface: Avaya SBCE" and features a sub-tab "Media Interface". A warning message states: "Modifying or deleting an existing media interface will require an application restart before taking effect. Application restarts can be issued from [System Management](#)." Below this is a table of configured media interfaces.

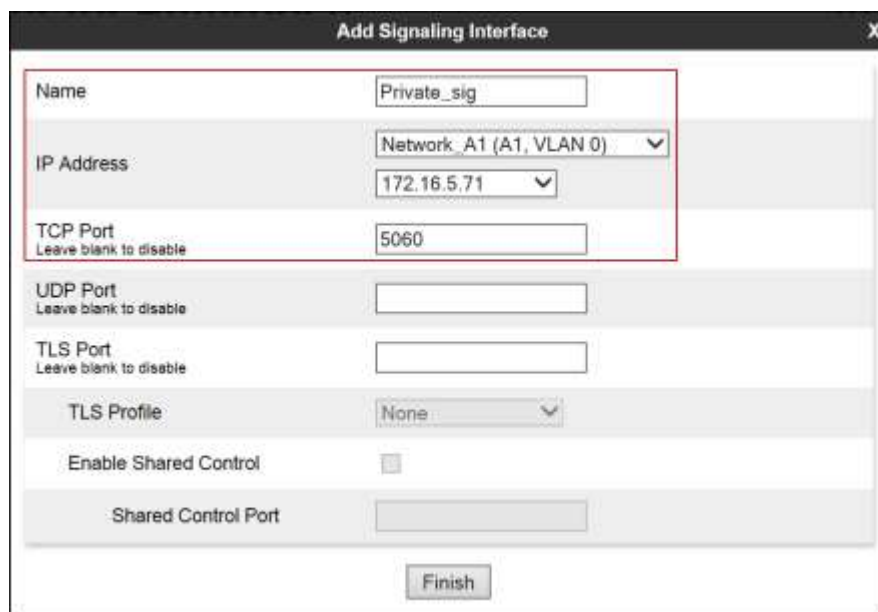

Name	Media IP Network	Port Range	Edit	Delete
Private_med	172.16.5.71 Network_A1 (A1, VLAN 0)	35000 - 40000	Edit	Delete
Public_med	172.16.5.199 Network_A3 (A3, VLAN 0)	35000 - 40000	Edit	Delete
...

7.4.3. Signaling Interface

To create the Signaling Interface toward Session Manager, from the **Device Specific** menu on the left hand side, select **Signaling Interface**.

Below is the configuration of the inside private Signaling Interface of the Avaya SBCE.

- Select **Add** in the **Signaling Interface** area.
- **Name:** *Private_sig*.
- Under **IP Address** select: **Network_A1 (A1, VLAN 0)**
Select **IP Address:** *172.16.5.71* (Inside or A1 IP Address of the Avaya SBCE, toward Session Manager).
- **TCP Port:** *5060*
- Click **Finish**.

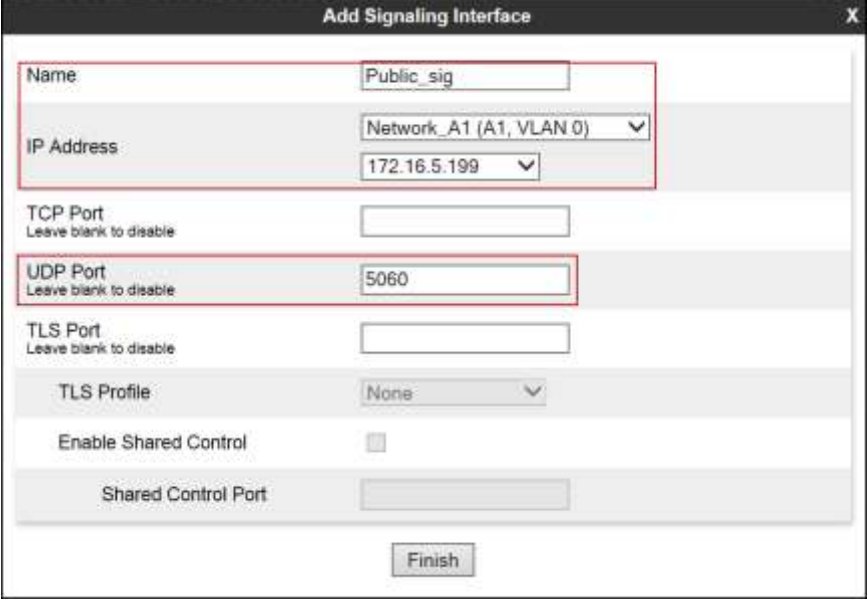

The screenshot shows a configuration window titled "Add Signaling Interface". The window contains several fields and a "Finish" button. A red rectangular box highlights the "Name", "IP Address", and "TCP Port" fields. The "Name" field contains "Private_sig". The "IP Address" field is a dropdown menu showing "Network_A1 (A1, VLAN 0)" with a sub-dropdown showing "172.16.5.71". The "TCP Port" field contains "5060". Below these fields are "UDP Port", "TLS Port", and "TLS Profile" fields, all with "Leave blank to disable" text. The "Enable Shared Control" checkbox is unchecked. The "Shared Control Port" field is empty. The "Finish" button is at the bottom right.

Name	Private_sig
IP Address	Network_A1 (A1, VLAN 0) 172.16.5.71
TCP Port <small>Leave blank to disable</small>	5060
UDP Port <small>Leave blank to disable</small>	
TLS Port <small>Leave blank to disable</small>	
TLS Profile	None
Enable Shared Control	<input type="checkbox"/>
Shared Control Port	
Finish	

Below is the configuration of the outside, public signaling Interface of the Avaya SBCE.

- Select **Add** in the **Signaling Interface** area.
- **Name:** *Public_sig*.
- Under **IP Address** select: **Network_A1 (A1, VLAN 0)**
- Select **IP Address:** *172.16.5.199* (IP Address of the Avaya SBCE toward the Service Provider via the VPN Tunnel).
- **UDP Port:** *5060*.
- Click **Finish**.

The screenshot shows a configuration window titled "Add Signaling Interface" with a close button (X) in the top right corner. The window contains several input fields and a "Finish" button at the bottom. The following fields are highlighted with red boxes:

- Name:** A text input field containing "Public_sig".
- IP Address:** A dropdown menu showing "Network_A1 (A1, VLAN 0)" and a text input field below it containing "172.16.5.199".
- UDP Port:** A text input field containing "5060".

Other fields include:

- TCP Port:** A text input field with the instruction "Leave blank to disable".
- TLS Port:** A text input field with the instruction "Leave blank to disable".
- TLS Profile:** A dropdown menu showing "None".
- Enable Shared Control:** A checkbox that is currently unchecked.
- Shared Control Port:** A text input field.

A "Finish" button is located at the bottom center of the window.

The following screen capture shows the newly created **Signaling Interfaces**.

7.4.4. End Point Flows

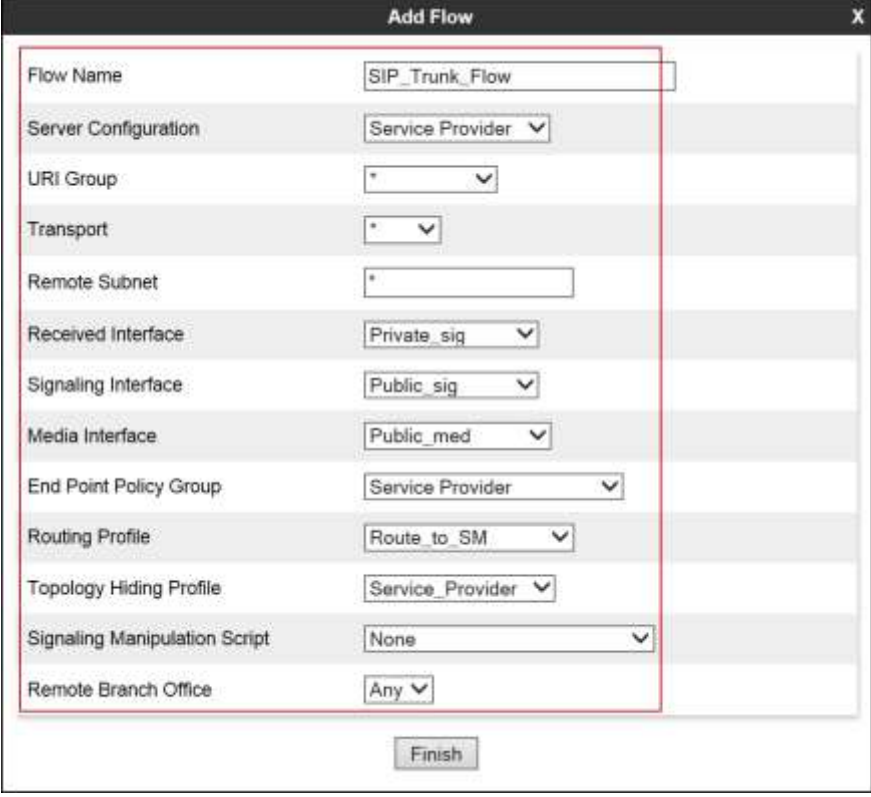

When a packet is received by Avaya SBCE, the content of the packet (IP addresses, URIs, etc.) is used to determine which flow it matches. Once the flow is determined, the flow points to a policy group which contains several rules concerning processing, privileges, authentication, routing, etc. Once routing is applied and the destination endpoint is determined, the policies for this destination endpoint are applied. The context is maintained, so as to be applied to future packets in the same flow. The following screen illustrates the flow through the Avaya SBCE to secure a SIP Trunk call.

The **End-Point Flows** defines certain parameters that pertain to the signaling and media portions of a call, whether it originates from within the enterprise or outside of the enterprise.

To create the call flow toward the Service Provider SIP trunk, from the **Device Specific Settings** menu, select **End Point Flows**, and then the **Server Flows** tab. Click **Add** (not shown).

- **Flow Name:** *SIP_Trunk_Flow*.
- **Server Configuration:** *Service Provider*.
- **URI Group:** *
- **Transport:** *
- **Remote Subnet:** *
- **Received Interface:** *Private_sig*.
- **Signaling Interface:** *Public_sig*.
- **Media Interface:** *Public_med*.
- **End Point Policy Group:** *Service Provider*.
- **Routing Profile:** *Route_to_SM* (Note that this is the reverse route of the flow).
- **Topology Hiding Profile:** *Service_Provider*.
- **Signaling Manipulation Script:** *None*.
- **Remote Branch Office:** *Any*.
- Click **Finish**.

The screenshot shows a window titled "Add Flow" with a close button (X) in the top right corner. The window contains a list of configuration fields, each with a label and a value field. A red rectangular box highlights the entire configuration area. The fields and their values are:

Field	Value
Flow Name	SIP_Trunk_Flow
Server Configuration	Service Provider
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	Private_sig
Signaling Interface	Public_sig
Media Interface	Public_med
End Point Policy Group	Service Provider
Routing Profile	Route_to_SM
Topology Hiding Profile	Service_Provider
Signaling Manipulation Script	None
Remote Branch Office	Any

At the bottom of the window, there is a "Finish" button.

To create the call flow toward the Session Manager, click **Add**.

- **Flow Name:** *Session_Manager_Flow*.
- **Server Configuration:** *Session Manager*.
- **URI Group:** *
- **Transport:** *
- **Remote Subnet:** *
- **Received Interface:** *Public_sig*.
- **Signaling Interface:** *Private_sig*.
- **Media Interface:** *Private_med*.
- **End Point Policy Group:** *Enterprise*.
- **Routing Profile:** *Route_to_SP* (Note that this is the reverse route of the flow).
- **Topology Hiding Profile:** *Session_Manager*.
- **Signaling Manipulation Script:** *None*.
- **Remote Branch Office:** *Any*.
- Click **Finish**.

The screenshot shows a dialog box titled "Add Flow" with a close button (X) in the top right corner. The dialog contains a list of configuration fields, each with a label and a value field. A red rectangular box highlights the entire configuration area. The fields and their values are:

Field	Value
Flow Name	Session_Manager_Flow
Server Configuration	Session Manager
URI Group	*
Transport	*
Remote Subnet	*
Received Interface	Public_sig
Signaling Interface	Private_sig
Media Interface	Private_med
End Point Policy Group	Enterprise
Routing Profile	Route_to_SP
Topology Hiding Profile	Session_Manager
Signaling Manipulation Script	None
Remote Branch Office	Any

At the bottom of the dialog, there is a "Finish" button.

The following screen capture shows the newly created **End Point Flows**.

The screenshot displays the Avaya Session Border Controller for Enterprise (SBCE) web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header shows "Session Border Controller for Enterprise" and the Avaya logo.

On the left, a sidebar menu lists various configuration options, with "End Point Flows" highlighted under "Device Specific Settings".

The main content area is titled "End Point Flows: Avaya SBCE". It features two tabs: "Subscriber Flows" and "Server Flows". The "Server Flows" tab is active, showing a table of configured flows.

The table is divided into two sections: "Server Configuration: Service Provider" and "Server Configuration: Session Manager".

Server Configuration: Service Provider

1	SIP_Trunk_Flow	*	Private_sig	Public_sig	Service Provider	Route_to_SM	View Clone Edit Delete

Server Configuration: Session Manager

Priority	Flow Name	URI Group	Received Interface	Signaling Interface	End Point Policy Group	Routing Profile	
2	Session_Manager_Flow	*	Public_sig	Private_sig	Enterprise	Route_to_SP	View Clone Edit

8. Claro SIP Trunking Service Configuration

To use Claro's SIP Trunking Service, a customer must request the service from Claro using the established sales processes. The process can be started by contacting Claro via the corporate web site at: <http://www.claro.com.do/wps/portal/do/sc/empresas> and requesting information.

During the signup process, Claro and the customer will discuss details about the preferred method to be used to connect the customer's enterprise network to Claro's network. Claro will provide IP addresses, Direct Inward Dialed (DID) numbers to be assigned to the enterprise, etc. This information is used to complete the Avaya Aura® Communication Manager, Avaya Aura® Session Manager and Avaya Session Border Controller for Enterprise configuration discussed in the previous sections.

During the interoperability testing, a VPN connection was used to connect the simulated enterprise site to Claro's network via the public Internet. The connection could also be done without the use of a VPN connection, by directly connecting the Avaya SBCE via the public Internet to a public facing SBC located in Claro's network. This is accomplished by assigning public IP addresses, capable of being reached across the public Internet, to the Avaya SBCE (interface **B1**) and to the Claro's SBC.

9. Verification and Troubleshooting

This section provides verification steps that may be performed in the field to verify that the solution is configured properly. This section also provides a list of useful troubleshooting commands that can be used to troubleshoot the solution.

Verification Steps:

1. Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active for more than 35 seconds. This time period is included to verify that proper routing of the SIP messaging has satisfied SIP protocol timers.
2. Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active with two-way audio for more than 35 seconds.
3. Verify that the user on the PSTN can end an active call by hanging up.
4. Verify that an endpoint at the enterprise site can end an active call by hanging up.

9.1. Troubleshooting

9.1.1. Communication Manager

- **list trace station** <extension number>
Traces calls to and from a specific station.
- **list trace tac** <trunk access code number>
Traces calls over a specific trunk group.
- **status signaling-group** <signaling group number>
Displays signaling group service state.
- **status trunk** <trunk group number>
Displays trunk group service state.
- **status station** <extension number>
Displays signaling and media information for an active call on a specific station.

9.1.2. Session Manager

- **traceSM -x** – Session Manager command line tool for traffic analysis. Login to the Session Manager management CLI interface to run this command.
- **Call Routing Test** - The Call Routing Test verifies the routing for a particular source and destination. To run the routing test, navigate to **Home → Elements → Session Manager → System Tools → Call Routing Test**. Enter the requested data to run the test.

9.1.3. Avaya SBCE

There are several links and menus located on the taskbar at the top of the screen of the web interface that can be used for diagnostic and troubleshooting.

Alarms: Provides information about the health of the Avaya SBCE.

The following screen shows the **Alarm Viewer** page.

Incidents : Provides detailed reports of anomalies, errors, policies violations, etc.

Diagnostics: This screen provides a variety of tools to test and troubleshoot the Avaya SBCE network connectivity.

The following screen shows the Diagnostics page with the results of a ping test. Note that IP addresses have been blurred out for security reasons.

Additionally, the Avaya SBCE contains an internal packet capture tool that allows the capture of packets on any of its interfaces, saving them as pcap files. Navigate to **Device Specific Settings** → **Troubleshooting** → **Trace**. Select the **Packet Capture** tab, set the desired configuration for the trace and click **Start Capture**.

The screenshot displays the Avaya Session Border Controller for Enterprise (SBCE) web management interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the Avaya logo on the right. On the left sidebar, the "Device Specific Settings" menu is expanded, showing options like Network Management, Media Interface, Signaling Interface, End Point Flows, Session Flows, DMZ Services, TURN/STUN Service, SNMP, Syslog Management, and Advanced Options. Under "Advanced Options", the "Troubleshooting" section is selected, and the "Trace" option is highlighted. The main content area is titled "Trace: Avaya SBCE" and contains two tabs: "Packet Capture" (active) and "Captures". The "Packet Capture Configuration" form includes the following fields: Status (Ready), Interface (A1), Local Address (IP:Port) (All), Remote Address (*), Protocol (All), Maximum Number of Packets to Capture (10000), and Capture Filename (Test.pcap). A note below the filename states: "Using the name of an existing capture will overwrite it." At the bottom of the form are "Start Capture" and "Clear" buttons.

Once the capture is stopped, click on the **Captures** tab and select the proper pcap file. Note that the date and time is appended to the filename specified previously. The file can now be saved to the local PC, where it can be opened with an application such as Wireshark.

The screenshot displays the Avaya Session Border Controller for Enterprise web interface. The top navigation bar includes links for Alarms, Incidents, Status, Logs, Diagnostics, Users, Settings, Help, and Log Out. The main header reads "Session Border Controller for Enterprise" with the AVAYA logo on the right. On the left, a sidebar menu lists various configuration and monitoring options, including TLS Management, Device Specific Settings, Network Management, Media Interface, Signaling Interface, End Point Flows, Session Flows, DMZ Services, TURN/STUN Service, SNMP, Syslog Management, Advanced Options, Troubleshooting, Debugging, Trace, DoS, and Learning. The "Trace" option is highlighted. The main content area is titled "Trace: Avaya SBCE" and features two tabs: "Packet Capture" and "Captures". The "Captures" tab is active, showing a table of captured files. The table has columns for File Name, File Size (bytes), and Last Modified. A single entry is listed: "Test_20151012004900.pcap" with a size of 12,288 bytes and a timestamp of October 12, 2015 12:49:10 AM CDT. A "Delete" link is visible next to the entry. A "Refresh" button is located at the top right of the table.

File Name	File Size (bytes)	Last Modified
Test_20151012004900.pcap	12,288	October 12, 2015 12:49:10 AM CDT

10.Conclusion

These Application Notes describe the procedures necessary for configuring Session Initiation Protocol (SIP) Trunk service for an enterprise solution consisting of Avaya Aura® Communication Manager Release 7.0, Avaya Aura® Session Manager Release 7.0, and Avaya Session Border Controller for Enterprise Release 7.0 to support Claro SIP Trunking Service, as shown in **Figure 1**.

Interoperability testing was completed successfully with the observations/limitations outlined in the scope of testing in **Section 2.1** as well as under test results in **Section 2.2**.
