

Avaya Solution & Interoperability Test Lab

Application Notes for Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise with Verizon Business IP Contact Center VoIP Inbound – Issue 1.0

Abstract

These Application Notes describe a sample configuration of Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise with Verizon Business IP Contact Center (IPCC) IP Toll Free VoIP Inbound service. The Verizon Business IPCC Services suite includes the IP Toll Free VoIP Inbound and IP-IVR SIP trunk service offers. These Application Notes illustrate IP Toll Free VoIP Inbound. This service provides toll free inbound calling via standards-based SIP trunks as well as re-routing of inbound toll free calls to alternate destinations based upon SIP messages (i.e., REFER) generated by Avaya Aura® Communication Manager. The Network Call Redirection (NCR) and SIP User-to-User Information (UII) features can be utilized together to transmit UII within SIP signaling messages to alternate destinations via the Verizon network. These Application Notes update previously published Application Notes with newer versions of Avaya Aura® Communication Manager and Avaya Aura® Session Manager, and present an example configuration for the Avaya Session Border Controller for Enterprise.

The configuration and software versions described in these Application Notes have not yet been independently certified by Verizon labs. These Application Notes can be used to facilitate customer engagements via the Verizon field trial process, pending Verizon labs independent certification.

Information in these Application Notes has been obtained through DevConnect compliance testing and additional technical discussions. Testing was conducted in the Avaya Solution & Interoperability Test Lab, utilizing a Verizon Business Private IP (PIP) circuit connection to the production Verizon Business IPCC Services.

NOTE: This Application Note is applicable with Avaya Aura® 6.2 which is currently in Controlled Introduction. Avaya Aura® 6.2 will be Generally Available in Summer 2012.

1. Introduction

These Application Notes describe a sample configuration of Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise with Verizon Business IP Contact Center (IPCC) Services suite. The Verizon Business IPCC Services suite includes the IP Toll Free VoIP Inbound and IP-IVR SIP trunk service offers. Access to these Verizon features may use Internet Dedicated Access (IDA) or Private IP (PIP). These Application Notes cover IP Toll Free VoIP Inbound using PIP access. Verizon IP Toll Free VoIP Inbound service provides toll free inbound calling via standards-based SIP trunks as well as re-routing of inbound toll free calls to alternate destinations based upon SIP messages (i.e., REFER) generated by Avaya Aura® Communication Manager. The Network Call Redirection (NCR) and SIP User-to-User Information (UUI) features can be utilized together to transmit UUI within SIP signaling messages to alternate destinations via the Verizon network. These Application Notes update previously published Application Notes [JRR-VZIPCC] with newer versions of Avaya Aura® Communication Manager and Avaya Aura® Session Manager, and present an example configuration for the Avaya Session Border Controller for Enterprise.

The configuration and software versions described in these Application Notes have not yet been independently certified by Verizon labs. These Application Notes can be used to facilitate customer engagements via the Verizon field trial process, pending Verizon labs independent certification.

In the sample configuration, an Avaya Session Border Controller for Enterprise (SBCE) is used as an edge device between the Avaya CPE and Verizon Business. The Avaya SBCE performs SIP header manipulation and provides topology hiding. Avaya Aura® Session Manager is used as the Avaya SIP trunking “hub” connecting to Avaya Aura® Communication Manager, the Avaya SBCE, and other applications.

The Verizon Business IP Toll Free VoIP Inbound service provides inbound toll-free service via standards-based SIP trunks. Using SIP Network Call Redirection (NCR), trunk-to-trunk connections of certain inbound calls at Avaya Aura® Communication Manager can be avoided by requesting that the Verizon network transfer the inbound caller to an alternate destination. In addition, the SIP User-to-User Information (UUI) feature can be utilized with the SIP NCR feature to transmit UUI within SIP signaling messages to alternate destinations. This capability allows the service to transmit a limited amount of call-related data between call centers to enhance customer service and increase call center efficiency. Examples of UUI data might include a customer account number obtained during a database query or the best service routing data exchanged between sites.

For more information on the Verizon Business IP Contact Center service, visit <http://www.verizonbusiness.com/Products/communications/contact-center/>

2. General Test Approach and Test Results

The Avaya equipment depicted in **Figure 1** was connected to the commercially available Verizon Business IPCC IP Toll Free VoIP Inbound Service. This allowed PSTN users to dial toll-free numbers assigned by Verizon. The toll-free numbers were configured to be routed within the enterprise to Avaya Aura® Communication Manager extensions, including Vector Directory Numbers (VDNs). The VDNs were associated with vectors configured to exercise Communication Manager ACD functions as well as Verizon IPCC Services such as network call redirection to PSTN destinations, and network call redirection with UUI.

The test approach was manual testing of inbound and referred calls using the Verizon IPCC Services on a production Verizon PIP access circuit, as shown in **Figure 1**.

The main objectives were to verify the following features and functionality:

- Inbound Verizon toll-free calls to Communication Manager telephones and VDNs/Vectors
- Inbound private toll-free calls (e.g., PSTN caller uses *67 followed by the toll-free number)
- Inbound Verizon toll-free calls redirected using Communication Manager SIP NCR (via SIP REFER/Refer-To) to PSTN alternate destinations
- Inbound Verizon IP toll-free calls redirected using Communication Manager SIP NCR with UUI (via SIP REFER/Refer-To with UUI) to a SIP-connected destination
- Inbound toll-free voice calls can use G.711MU or G.729A codecs.
- Inbound toll-free voice calls can use DTMF transmission using RFC 2833

Testing was successful. Test observations or limitations are described in **Section 2.2**.

See **Section 3.2** for an overview of key call flows and **Section 9** for detailed verifications and traces illustrating key call flows.

2.1. Interoperability Compliance Testing

The interoperability compliance testing included the execution of test cases from the Verizon-authored interoperability test plan [VZ-Test-Plan].

- SIP OPTIONS monitoring of the health of the SIP trunks was verified. Both the Avaya enterprise equipment and Verizon Business can monitor health using SIP OPTIONS.
- Incoming calls from the PSTN were routed to the toll-free numbers assigned by Verizon Business to the Avaya location. Configuration was varied such that these incoming toll-free calls were directed to Communication Manager telephone extensions and Communication Manager VDNs containing call routing logic to exercise SIP Network Call Redirection.
- Proper disconnect when either party hangs up an active call.
- Proper disconnect when the PSTN caller abandons (i.e., hangs up) a toll free call before the call has been answered.
- Proper SIP 486 response and busy tone heard by the caller when a PSTN user calls a toll-free number directed to a busy user or resource when no redirection on busy conditions was configured (which would be unusual in a contact center).

- Proper termination of an inbound IP Toll Free call left in a ringing state for a relatively long duration, which again would be unusual in a contact center. In the sample configuration, Verizon sent a SIP CANCEL to cancel the call after three minutes of ring no answer conditions, returning busy tone to the PSTN caller.
- Privacy requests for inbound toll-free calls from the PSTN were verified. That is, when privacy is requested by a PSTN caller (e.g., dialing *67 from a mobile phone), the inbound toll-free call can be successfully completed while withholding presentation of the PSTN caller id to user displays. (When the caller requests privacy, Verizon IP Toll Free sends the caller ID in the P-Asserted-Identity header and includes “Privacy: id” which is honored by Communication Manager).
- Inbound toll-free call long holding time call stability. Communication Manager sends a re-INVITE with SDP to refresh the session at the configured session refresh interval specified on the Communication Manager trunk group handling the call. In the sample configuration, the session refresh re-INVITE was sent after 900 seconds (15 minutes), the interval configured for the trunk group in **Section 5.8**. The call continued with proper talk path.
- Telephony features such as hold and resume. When a Communication Manager user holds a call in the sample configuration, Communication Manager will send a re-INVITE to Verizon with a media attribute “sendonly”. The Verizon 200 OK to this re-INVITE will include media attribute “recvonly”. While the call remains on hold, RTP will flow from the Avaya CPE to Verizon, but no RTP will flow from Verizon to the Avaya CPE (i.e., as intended). When the user resumes the call from hold, bi-directional media path resumes. Although it would be unexpected in a contact center, calls on hold for longer than the session refresh interval were tested, and such calls could be resumed after the session refresh.
- Transfer of toll-free calls between Communication Manager users.
- Incoming voice calls using the G.729a and G.711 ULAW codecs and proper protocol procedures related to media.
- DTMF transmission using RFC2833. For inbound toll-free calls, PSTN users dialing post-answer DTMF digits are recognized properly by the Avaya CPE.
- Proper DiffServ markings for SIP signaling and RTP media flowing from the Avaya CPE to Verizon.

2.2. Test Results

The interoperability compliance testing of the sample configuration was completed with successful results as described in **Section 2.1**. The following observations may be noteworthy:

- Verizon Business IPCC Services suite does not support fax.
- Verizon Business IPCC Services suite does not support History Info or Diversion Headers. The Avaya CPE will not send History-Info or Diversion header to Verizon IPCC in the sample configuration.
- Verizon Business IPCC Services suite does not support G.729 Annex b. When using G729, the Avaya CPE will always include “annexb=no” in SDP in the sample configuration.
- Reference [JRR-VZIPCC] described potential problems with call hold and resume, and transfer when the Network Call Redirection flag was set to “y” on a Communication Manager Release 6.0 trunk group. In reference [JRR-VZIPCC], user perceivable problems were averted using SBC manipulation of the SIP signaling. In the verification of these Application Notes for

Communication Manager Release 6.2, it is not necessary to implement an SBC workaround to the issue. As background, the “sendonly” media attribute in SDP is sent by Communication Manager when the Network Call Redirection (NCR) field on the SIP trunk is enabled and a call is on hold at the enterprise site. For example, when a call is placed on hold listening to music sourced from an Avaya G450 Media Gateway, Communication Manager signals a “sendonly” condition and Verizon replies with a “recvonly” condition. In this state, while music is being heard by the PSTN caller, RTP media is flowing from the CPE to Verizon only.

- In the prior testing associated with reference [JRR-VZIPCC], if Communication Manager Network Call Redirection (NCR) is enabled for the SIP trunk group used for the call, and a Verizon toll-free call is on hold listening to music on hold from the Avaya CPE, the music on hold would cease to be heard by the caller if a refresh re-INVITE is sent to Verizon while the call is on hold. Using the set of products and releases covered by these Application Notes, this scenario was re-tested, and the problem no longer occurs. The music on hold continues to be heard, even after the session refresh re-INVITE. After the exchange of SIP messages stimulated by a session refresh re-INVITE while a call is on hold for longer than the refresh interval, in the prior testing associated with reference [JRR-VZIPCC], the audio path could not be re-established when the user tried to resume the call. In the set of products and releases covered by these Application Notes, this scenario was re-tested and the problem no longer occurs. That is, the user may resume the call with full media path even if the call had been on hold for longer than the session refresh interval.
- In the prior testing associated with reference [JRR-VZIPCC], if Communication Manager Network Call Redirection (NCR) is enabled for the SIP trunk group used for the call, traditional transfer of an inbound toll-free call to another CPE telephone could result in no talk path conditions with the Verizon network after the transfer operation was completed. In the set of products and releases covered by these Application Notes, this scenario was re-tested and the problem no longer occurs. Bi-directional talk path is present after a transfer of a Verizon IP Toll Free call from one Communication Manager user to another, with NCR enabled on the SIP trunk group.
- **Section 3.2.3** summarizes a call flow that would theoretically allow a call to remain in Communication Manager vector processing upon failure of a vector-triggered REFER attempt. However, most such call scenarios could not be verified on the production Verizon circuit used for testing. On the production circuit, Verizon would send a BYE to terminate the call upon encountering REFER transfer failures, so there was no opportunity for the call to remain in Communication Manager vector processing.
- When call vectoring is used to generate a REFER to Verizon, Communication Manager typically sends a BYE immediately upon receipt of the Verizon “NOTIFY with sipfrag 200 OK”, which Verizon sends when the target of the REFER has answered the call. However, intermittently, it has been observed that Communication Manager does not send an immediate BYE to the “NOTIFY with sipfrag 200 OK”, and instead sends the BYE some time later. In either case, the original call is cleared, and the call to the target of the REFER that has been answered remains stable, so there is no user-perceived problem.
- The Session Manager Call Routing Test shown in the Verifications section of these Application Notes did not work properly when the Session Manager Listen Port was set to 5060, which is the port on which Session Manager receives the INVITE from the SBC. The screen in **Section 9.3.2** shows the port set to 5063 which enabled the Call Routing test to show routing results.

This observation affects the Call Routing test functionality only and has no bearing on the actual processing of calls, which were successful using port TCP 5060 between Session Manager and the SBC. This observation is under investigation (Session Manager WI00987473).

- The presence of Avaya generated SIP headers that Verizon need not receive, such as “P-Location”, in a SIP message sent to Verizon does not cause any user-perceivable problems. Nevertheless, for consistency with previously published Application Notes, SBC procedures are shown in **Section 7.8** to illustrate how headers such as P-Location that are not required by Verizon may be removed by the Avaya SBC for Enterprise. The SBC procedures shown are effective in removing P-Location from INVITE, and 18x responses. However, ACKs sent from the CPE to Verizon may still contain a P-Location header in the sample configuration. This observation is under investigation (Avaya SBC for Enterprise Aurora-158).

2.3. Support

2.3.1 Avaya

For technical support, visit <http://supppport.avaya.com>

2.3.2 Verizon

For technical support, visit <http://www.verizonbusiness.com/us/customer/>

3. Reference Configuration

Figure 1 illustrates the sample configuration used for the DevConnect compliance testing. The configuration is comprised of the Avaya CPE location connected via a T1 Internet connection to the Verizon Business IPCC service node. The Avaya CPE location simulates a customer site. At the edge of the Avaya CPE location is an Avaya Session Border Controller for Enterprise. The enterprise SBC receives traffic from Verizon on port 5060 and sends traffic to Verizon using destination port 5072, using UDP for transport. The PIP service defines a secure MPLS connection between the Avaya CPE T1 connection and the Verizon IPCC service node.

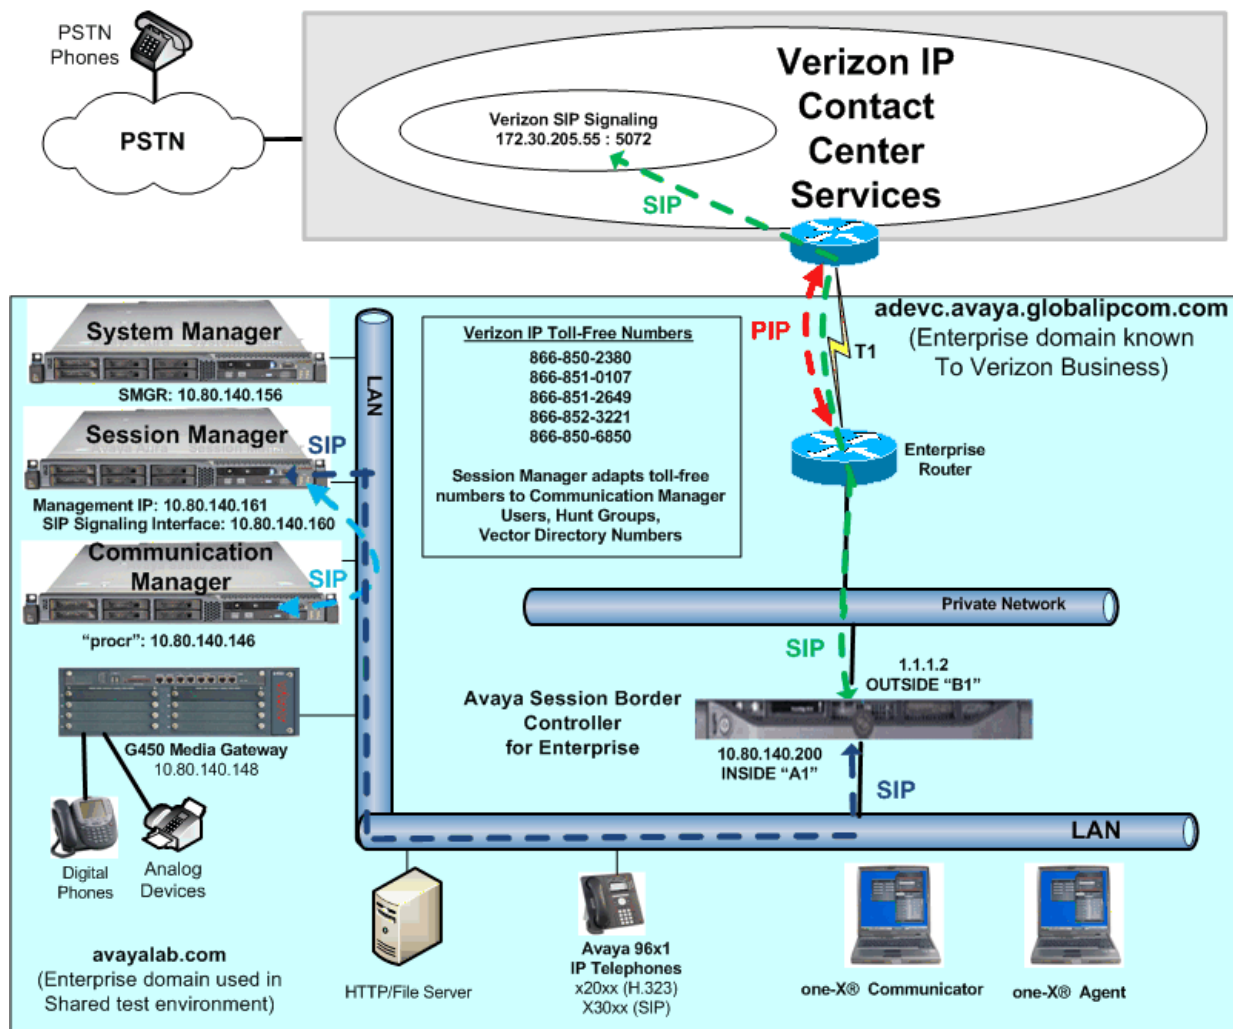

Figure 1: Avaya Interoperability Test Lab Configuration

The Verizon IP toll-free numbers were mapped by Session Manager or Communication Manager to various Communication Manager extensions. The extension mappings were varied during the testing to allow inbound toll-free calls to terminate directly on user extensions or indirectly through hunt groups, vector directory numbers (VDNs) and vectors to user extensions and contact center agents.

The Avaya CPE environment was known to Verizon as domain *adevc.avaya.globalipcom.com*. For efficiency, the Avaya CPE environment utilizing Session Manager Release 6.2 and Communication Manager Release 6.2 was shared among other ongoing test efforts at the Avaya Solutions and Interoperability Test lab. Access to the Verizon Business IPCC services was added to a configuration that already used domain “avayalab.com” at the enterprise. As such, Session Manager or the SBC are used to adapt the domains as needed. These Application Notes indicate the configuration that would not be required in cases where the CPE domain in Communication Manager and Session Manager match the CPE domain known to Verizon.

The following summarizes various header contents and manipulations for IP toll-free calls in the sample configuration:

- Verizon sends the following in the initial INVITE to the CPE:
 - The CPE FQDN of *adevc.avaya.globalipcom.com* in the Request URI.
 - The Verizon gateway IP address in the From header.
 - The enterprise SBC outside IP address (i.e., 1.1.1.2) in the To header.
 - Sends the INVITE to Avaya CPE using destination port 5060 via UDP
- Avaya Session Border Controller for Enterprise sends Session Manager:
 - The Request URI contains *avayalab.com*, to match the shared Avaya SIL test environment.
 - The host portion of the From header also contains *avayalab.com*
 - The host portion of the To header also contains *avayalab.com*
 - Sends the packet to Session Manager using destination port 5060 via TCP
- Session Manager to Communication Manager:
 - The Request URI contains *avayalab.com*, to match the shared Avaya SIL test environment.
 - Session Manager sends to Communication Manager using destination port 5063 via TCP to allow Communication Manager to distinguish Verizon IP Toll Free traffic from other traffic arriving from the same instance of Session Manager.

Note – The Fully Qualified Domain Names and IP addressing specified in these Application Notes apply only to the reference configuration shown in **Figure 1**. Verizon Business customers will use FQDNs and IP addressing appropriate for the unique customer environment.

3.1. History Info and Diversion Headers

The Verizon Business IPCC Services suite does not support SIP History Info Headers or Diversion Headers. Therefore, Communication Manager was provisioned not to send History Info Headers or Diversion Headers.

3.2. Call Flows

To understand how inbound Verizon toll-free calls are handled by Session Manager and Communication Manager, key call flows are summarized in this section.

3.2.1 Inbound IP Toll Free Call with no Network Call Redirection

The first call scenario illustrated in **Figure 2** is an inbound Verizon IP Toll Free call that is routed to Communication Manager, which in turn routes the call to a vector, agent, or phone. No redirection is performed in this simple scenario. A detailed verification of such a call with Communication Manager and Wireshark traces can be found in **Section 9.2.1**.

1. A PSTN phone originates a call to a Verizon IP Toll Free number.
2. The PSTN routes the call to the Verizon IP Toll Free service network.
3. The Verizon IP Toll Free service routes the call to the Avaya Session Border Controller for Enterprise.
4. The Avaya Session Border Controller for Enterprise performs any configured SIP header modifications, and routes the call to Session Manager.
5. Session Manager applies any configured SIP header adaptations and digit conversions, and based on configured Routing Policies, determines where the call should be routed. In this case, Session Manager routes the call to Communication Manager using a unique port so that Communication Manager can distinguish this call as having arrived from Verizon IPCC.
6. Depending on the called number, Communication Manager routes the call to a) a hunt group or vector, which in turn routes the call to an agent or phone, or b) directly to a phone.

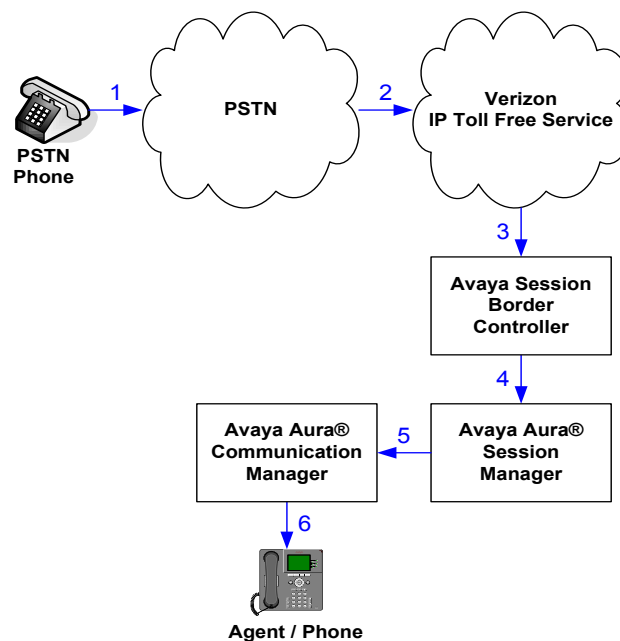

Figure 2: Inbound Verizon IP Toll Free Call – No Redirection

3.2.2 Inbound IP Toll Free Call with Post-Answer Network Call Redirection

The second call scenario illustrated in **Figure 3** is an inbound Verizon IP Toll Free call that is routed to a Communication Manager Vector Directory Number (VDN) to invoke call handling logic in a vector. The vector answers the call and then redirects the call back to the Verizon IP Toll Free

service for routing to an alternate destination. Note that Verizon IP Toll Free service does not support redirecting a call before it is answered (using a SIP 302), and therefore the vector must include a step that results in answering the call, such as playing an announcement prior to redirecting the call using REFER.

A detailed verification of such call with both Communication Manager and Wireshark traces can be found in **Section 9.2.2** for a PSTN destination and **Section 9.2.3** for a Verizon IP Toll Free SIP-connected alternate destination. In the latter case, the Verizon IP Toll Free service can be used to pass User to User Information (UII) from the redirecting site to the alternate destination.

1. Same as the first five steps in **Figure 2**.
2. Communication Manager routes the call to a vector, which answers the call, plays an announcement, and attempts to redirect the call by sending a SIP REFER message out the SIP trunk from which the inbound call arrived. The SIP REFER message specifies the alternate destination in the Refer-To header. The SIP REFER message passes back through Session Manager and the Avaya SBCE to the Verizon IP Toll Free service network.
3. The Verizon IP Toll Free service places a call to the target party contained in the Refer-To header. Upon answer, the calling party is connected to the target party.
4. The Verizon IP Toll Free service notifies the CPE that the referred call has been answered (i.e., NOTIFY/sipfrag 200 OK). Communication Manager sends a BYE. The calling party and the target party can talk. The trunk upon which the call arrived in Step 1 is idle.

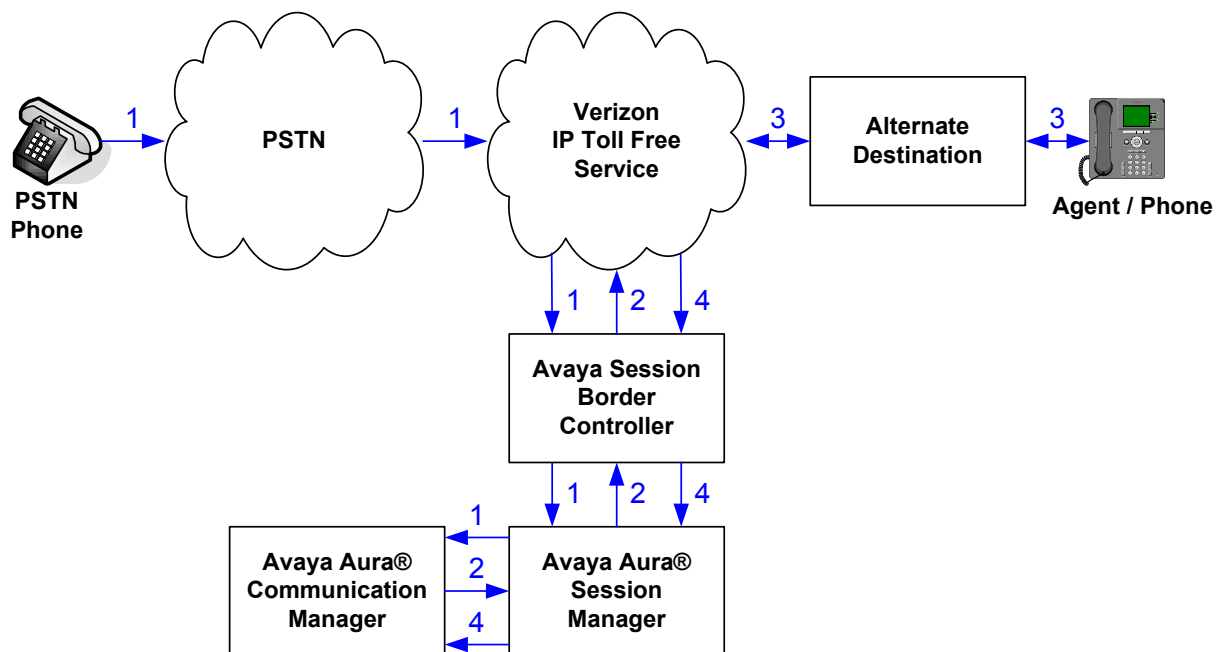

Figure 3: Inbound Verizon IP Toll Free– Post-Answer SIP REFER Redirection Successful

3.2.3 Inbound IP Toll Free Call with Unsuccessful Network Call Redirection

The next call scenario illustrated in **Figure 4** is similar to the previous call scenario, except that the redirection is unsuccessful. In general, if redirection is successful, Communication Manager can “take the call back” and continue vector processing. For example, the call may route to an alternative agent, phone, or announcement after unsuccessful NCR.

1. Same as **Figure 2**.
2. Same as **Figure 2**.
3. The Verizon IP Toll Free service places a call to the target party (alternate destination), but the target party is busy or otherwise unavailable.
4. The Verizon IP Toll Free service notifies the redirecting/referring party (Communication Manager) of the error condition.
5. Communication Manager routes the call to a local agent, phone, or announcement.

However, as noted in **Section 2.2**, except for egregious configuration errors, this “REFER error handling” scenario could not be verified on the production Verizon circuit used for testing. On the production circuit, Verizon sends a SIP BYE which terminates Communication Manager vector processing for failure scenarios. For example, if a 486 Busy is received from the target of the REFER, Verizon will send a BYE immediately after a “NOTIFY/sipfrag 486”, which precludes any further call processing by Communication Manager. As another example, in cases where mis-configuration is introduced to cause the Refer-To header to be malformed (e.g., no “+” in Refer-To), Verizon will send a BYE immediately after a “NOTIFY/sipfrag 603 Server Internal Error”. If REFER is configured in the vector, but Network Call Redirection is not enabled for the SIP trunk group, Communication Manager will not send the REFER to Verizon, and vector processing will continue at the step following the route-to step that would normally trigger the REFER.

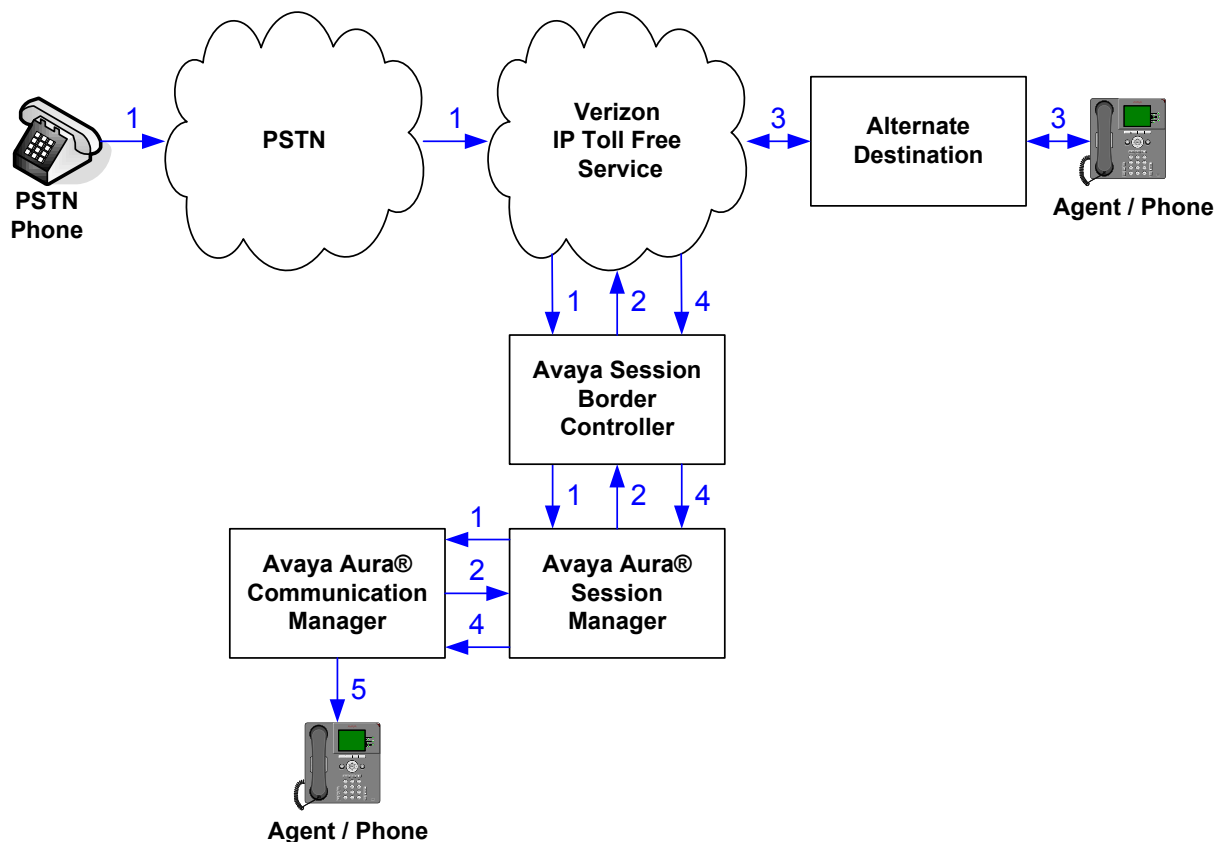

Figure 4: Inbound Verizon IP Toll Free– Post-Answer SIP REFER Redirection Unsuccessful

4. Equipment and Software Validated

The following equipment and software were used in the sample configuration.

Equipment	Software
Avaya Aura® Communication Manager running on HP Common Server	Avaya Aura® Communication Manager Release 6.2 (823.0)
Avaya Aura® System Manager running on HP Common Server	Avaya Aura® System Manager Release 6.2
Avaya Aura® Session Manager running on HP Common Server	Avaya Aura® Session Manager Release 6.2
Avaya one-X® Communicator	Release 6.0.1.16 SP1
Avaya IP Agent	Release 2.5
Avaya 96x1-Series IP Telephones (H.323)	Release 6.0 SP5
Avaya 96x1-Series IP Telephones (SIP)	Release 6.0 SP3
Avaya 2400-Series Digital Telephones	N/A
Avaya Session Border Controller for Enterprise	Release 4.0.5 Q02

Table 1: Equipment and Software Used in the Sample Configuration

5. Configure Communication Manager Release 6.2

This section illustrates an example configuration allowing SIP signaling via the “Processor Ethernet” of Communication Manager to Session Manager. In configurations that use an Avaya G650 Media Gateway, it is also possible to use an Avaya C-LAN in the Avaya G650 Media Gateway for SIP signaling to Session Manager.

Note – For the Avaya servers and media gateways, the initial installation, configuration, and licensing are assumed to have been previously completed and are not discussed in these Application Notes. These Application Notes focus on describing the sample configuration as it relates to SIP Trunking to Verizon IPCC.

Configuration is illustrated via the Communication Manager SAT interface. Screens are abridged for brevity in presentation.

5.1. Verify Licensed Features

The Communication Manager license file controls customer capabilities. Contact an authorized Avaya representative for assistance if a required feature needs to be enabled.

On **Page 2** of the *display system-parameters customer-options* form, verify that the **Maximum Administered SIP Trunks** is sufficient for the combination of trunks to the Verizon Business IPCC Services and any other SIP applications. Each call from the Verizon Business IPCC Services to a non-SIP endpoint uses one SIP trunk for the duration of the call. Each call from Verizon Business IPCC Services to a SIP endpoint uses two SIP trunks for the duration of the call.

display system-parameters customer-options		Page	2 of 11
OPTIONAL FEATURES			
IP PORT CAPACITIES	USED		
Maximum Administered H.323 Trunks:	12000	0	
Maximum Concurrently Registered IP Stations:	18000	12	
Maximum Administered Remote Office Trunks:	12000	0	
Maximum Concurrently Registered Remote Office Stations:	18000	0	
Maximum Concurrently Registered IP eCons:	414	0	
Max Concur Registered Unauthenticated H.323 Stations:	100	0	
Maximum Video Capable Stations:	18000	0	
Maximum Video Capable IP Softphones:	18000	0	
Maximum Administered SIP Trunks:	24000	50	
Maximum Administered Ad-hoc Video Conferencing Ports:	24000	0	
Maximum Number of DS1 Boards with Echo Cancellation:	522	0	
Maximum TN2501 VAL Boards:	128	0	
Maximum Media Gateway VAL Sources:	250	1	
Maximum TN2602 Boards with 80 VoIP Channels:	128	0	
Maximum TN2602 Boards with 320 VoIP Channels:	128	0	
Maximum Number of Expanded Meet-me Conference Ports:	300	0	

On **Page 4** of the *System-Parameters Customer-Options* form, verify that **IP Trunks** and **IP Stations** are enabled. If the use of SIP REFER messaging will be required for the call flows as described in **Section 3.2**, verify that the **ISDN/SIP Network Call Redirection** feature is enabled.

5.2. Dial Plan

In the sample configuration, the Avaya CPE environment uses four digit local extensions, such as 2xxx, 3xxx, and 4xxx. Trunk Access Codes (TAC) are 4 digits in length and begin with *1. The Feature Access Code (FAC) to access ARS is the single digit 9. The dial plan illustrated here is not intended to be prescriptive; any valid dial plan may be used. The dial plan is modified with the **change dialplan analysis** command as shown below.

change dialplan analysis						Page 1 of 12			
DIAL PLAN ANALYSIS TABLE									
Location: all						Percent Full: 1			
Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	Dialed String	Total Length	Call Type	
1	3	fac							
2	4	ext							
3	4	ext							
4	4	ext							
8	1	fac							
9	1	fac							
*	1	fac							
*1	4	dac							
#	3	fac							

5.3. Node Names

Node names are mappings of names to IP Addresses that can be used in various screens. The following abridged “display node-names ip” output shows relevant node-names in the sample configuration. As shown in bold, the node name for Session Manager is “ASM6-2” with IP Address **10.80.140.160**. The node name and IP Address (**10.80.140.146**) for the Processor Ethernet “procr” appears automatically due to the initial installation and configuration of the system. The text at the bottom of the screen provides the command syntax for listing, changing, or adding node names.

display node-names ip		Page 1 of 2
		IP NODE NAMES
Name	IP Address	
ASM6-2	10.80.140.160	
Gateway1	10.80.140.1	
default	0.0.0.0	
procr	10.80.140.146	
Use 'list node-names' command to see all the administered node-names		
Use 'change node-names ip xxx' to change a node-name 'xxx' or add a node-name		

5.4. IP Interface for procr

The “add ip-interface procr” or “change ip-interface procr” command can be used to configure the Processor Ethernet (PE) parameters. The following screen shows the parameters used in the sample configuration. While the focus here is the use of the PE for SIP Trunk Signaling, observe that the Processor Ethernet will also be used for registrations from H.323 IP Telephones and H.248 gateways in the sample configuration.

change ip-interface procr		Page 1 of 2
		IP INTERFACES

		IPV4 PARAMETERS
Node Name: procr	IP Address: 10.80.140.146	
Subnet Mask: /24		

5.5. Network Regions for Gateway, Telephones

Network regions provide a means to logically group resources. In the shared Communication Manager configuration used for the testing, the Avaya G450 Media Gateway is in region 1. To provide testing flexibility, network region 5 was associated with other logical components used specifically for the Verizon IPCC testing.

Non-IP telephones (e.g., analog, digital) derive network region and location configuration from the Avaya gateway to which the device is connected. The following display command shows that media gateway 1 is an Avaya G450 Media Gateway configured for network region 1. It can also be observed that the “Controller IP Address” is the processor Ethernet (10.80.140.146), and that the G450 “MGP IPV4 Address” is 10.80.140.148. These fields are not configured in this screen, but rather display the current information for the gateway.

change media-gateway 1		Page 1 of 2

IP telephones can be assigned a network region based on an IP address mapping. The following screen illustrates a subset of the IP network map configuration used to verify these Application Notes. If the IP address of a registering H.323 IP Telephone does not appear in the ip-network-map, the phone is assigned the network region of the “gatekeeper” (e.g., CLAN or PE) to which it registers. When the IP address of a registering H.323 IP telephone is in the ip-network-map, the phone can be assigned the network region assigned by the form shown below. For example, the IP address 10.10.103.10 would be mapped to network region 5, based on the bold configuration below. In production environments, different sites will typically be on different networks, and ranges of IP Addresses assigned by the DHCP scope serving the site can be entered as one entry in the network map, to assign all telephones in a range to a specific network region.

change ip-network-map		Page 1 of 63
IP ADDRESS MAPPING		
IP Address	Subnet Bits	Network Region VLAN
-----	-----	-----
FROM: 10.10.103.0	/24	5 n
TO: 10.10.103.255		
		Emergency Location Ext

The following screen shows IP Network Region 5 configuration. In the shared test environment, network region 5 is used to allow unique behaviors for the Verizon IPCC test environment. In this example, codec set 5 will be used for calls within region 5. The shared Avaya Solutions and Interoperability Test Lab environment uses the domain “avayalab.com” (i.e., for network region 1 including the region of the processor Ethernet “procr”). However, to illustrate the case where the Communication Manager domain matches the enterprise CPE domain known to Verizon, the **Authoritative Domain** in the following screen is “adevc.avaya.globalipcom.com”, the domain known to Verizon, as shown in **Figure 1**. Even with this configuration, note that the domain in the PAI header sent by Communication Manager to Session Manager will contain “avayalab.com”, the domain of the near-end of the Avaya signaling group. Session Manager will adapt “avayalab.com” to “adevc.avaya.globalipcom.com” in the PAI header as needed.

change ip-network-region 5		Page 1 of 20

The following screen shows the inter-network region connection configuration for region 5. The first bold row shows that network region 5 is directly connected to network region 1, and that codec set 5 will also be used for any connections between region 5 and region 1. For configurations where multiple remote gateways are used, each gateway will typically be configured for a different region, and this screen can be used to specify unique codec or call admission control parameters for the pairs of regions. If a different codec should be used for inter-region connectivity than for intra-region connectivity, a different codec set can be entered in the **codec set** column for the appropriate row in the screen shown below. Once submitted, the configuration becomes symmetric, meaning that network region 1, Page 4, will also show codec set 5 for region 5 to region 1 connectivity.

change ip-network-region 5										Page	4	of	20

5.6. IP Codec Sets

The following screen shows the configuration for codec set 5, the codec set configured to be used for calls within region 5 and for calls between region 1 and region 5. In general, an IP codec set is a list of allowable codecs in priority order. Using the example configuration shown below, all calls with Verizon IPCC via the SIP trunks would prefer to use **G.729A**, but also be capable of using **G.711MU**. (The Verizon IPCC service will not include G.722 in SDP offers or SDP answers). Any calls using this same codec set that are between devices capable of the **G.722-64K** codec can use G.722. The specification of G.722 as the first choice is not required. That is, G.722 may be omitted from the codec set, but it is recommended that G.729A and G.711MU be included in the codec set for use with Verizon IPCC Services.

change ip-codec-set 5				Page 1 of 2

5:				
6:				
7:				

5.7. SIP Signaling Groups

This section illustrates the configuration of the SIP Signaling Groups. Each signaling group has a **Group Type** of “sip”, a **Near-end Node Name** of “procr”, and a **Far-end Node Name** of “ASM6-2”. In the example screens, the **Transport Method** for all signaling groups is “tcp”. In production, TLS transport between Communication Manager and Session Manager may be used. The **Enable Layer 3 Test** field is enabled on each of the signaling groups to allow Communication Manager to maintain the signaling group using the SIP OPTIONS method. Fields that are not referenced in the text below can be left at default values, including **DTMF over IP** set to “rtp-payload”, which corresponds to RFC 2833.

The following screen shows signaling group 77. Signaling group 77 will be used for processing incoming calls from Verizon IPCC Service via Session Manager. The **Far-end Network Region** is configured to region 5. Port 5063 has been configured as both the **Near-end Listen Port** and **Far-end Listen Port**. Session Manager will be configured to direct calls arriving from the PSTN with Verizon toll-free numbers to a route policy that uses a unique SIP Entity and SIP Entity link to Communication Manager specifying port 5063. The use of different ports is one means to allow Communication Manager to distinguish different types of calls arriving from the same Session Manager. Other parameters may be left at default values.

change signaling-group 77		Page 1 of 2
SIGNALING GROUP

	Alternate Route Timer(sec): 6	

The following screen shows signaling group 3, the signaling group to Session Manager that was in place prior to adding the Verizon IPCC configuration to the shared Avaya Solutions and Interoperability Test Lab configuration. This signaling group reflects configuration not specifically related to Verizon IPCC. For example, calls using Avaya SIP Telephones and calls routed to other Avaya applications can use this signaling group. Again, the **Near-end Node Name** is “procr” and the **Far-end Node Name** is “ASM6-2”, the node name of the Session Manager. Unlike the signaling group used for the Verizon IPCC signaling, the **Far-end Network Region** is 1. The **Peer Detection Enabled** field is set to “y” and a peer Session Manager has been previously detected. The **Far-end Domain** is set to “avayalab.com” matching the configuration in place prior to adding the Verizon IPCC SIP Trunking configuration.

5.8. SIP Trunk Groups

This section illustrates the configuration of the SIP Trunks Groups corresponding to the SIP signaling groups from the previous section.

NOTE: For Verizon Business customers utilizing either Verizon **IP Contact Center** or **IP-IVR** service offers, at least one **Elite Agent license is required** to support the ability to utilize the Network Call Redirection capabilities of those services with Communication Manager. This license is required to enable the **ISDN/SIP Network Call Redirection** feature. This licensed feature must be turned **ON** to support Network Call Redirection. Additional details on how to configure Network Call Redirection in Communication Manager can be found within the supporting text and figures contained within this section.

The following shows page 1 for trunk group 77, which will be used for incoming IPCC calls from Verizon. The **Number of Members** field defines how many simultaneous calls are permitted for the trunk group. The **Service Type** field should be set to “public-ntwrk” for the trunks that will handle calls with Verizon. Although not strictly necessary, the **Direction** has been configured to “incoming” to emphasize that trunk group 77 is used for incoming calls only in the sample configuration.

```

change trunk-group 77                                     Page 1 of 21
                                     TRUNK GROUP

Service Type: public-ntwrk        Auth Code? n
                                     Member Assignment Method: auto
                                     Signaling Group: 77
                                     Number of Members: 10

```

The following shows **Page 2** for trunk group 77. All parameters shown are default values, except for the **Preferred Minimum Session Refresh Interval**, which has been changed from the default 600 to 900 (seconds). Although it is not strictly necessary to make this change, some SIP products prefer a higher session refresh interval than the Communication Manager default value, which can result in unnecessary SIP messages to re-establish a higher refresh interval for each call.

```

change trunk-group 77                                     Page 2 of 21

                                Replace Unavailable Numbers? y

Show ANSWERED BY on Display? y

```

The following shows **Page 4** for trunk group 77. The **PROTOCOL VARIATIONS** page is one reason why it can be advantageous to configure incoming calls from Verizon IPCC to arrive on specific signaling groups and trunk groups. The bold fields have non-default values. The **Convert 180 to 183 for Early Media** field was introduced in Communication Manager Release 6. Verizon expects inbound calls to the enterprise to result in either a SIP 180 without SDP, or a SIP 183 with SDP. (That is, Verizon prefers not to receive a 180 containing SDP.) Setting **Convert 180 to 183 for Early Media** field to “y” for the trunk group handling inbound calls from Verizon produces the 183 with SDP result. Although not strictly necessary, the **Telephone Event Payload Type** has been set to 101 to match Verizon expectation. Setting the **Network Call Redirection** flag to “y” enables advanced services associated with the use of the REFER message, while also implicitly enabling Communication Manager to signal “sendonly” media conditions for calls placed on hold at the enterprise site. If neither REFER signaling for NCR nor “sendonly” signaling is required for calls held at the enterprise, the **Network Call Redirection** field may be left at the default “n” value. In the testing associated with these Application Notes, the **Network Call Redirection** flag was set to “y” to allow REFER to be exercised with the Verizon IP Toll Free Service.

The Verizon IPCC Services do not support the Diversion header or the History-Info header, and therefore both **Support Request History** and **Send Diversion Header** are set to “n”.

5.9. Contact Center Configuration

This section describes the basic commands used to configure Vector Directory Numbers (VDNs) and corresponding vectors. These vectors contain steps that invoke the Communication Manager SIP Network Call Redirection (NCR) functionality. These Application Notes provide rudimentary vector definitions to demonstrate and test the SIP NCR and UUI functionalities. In general, call centers will use vector functionality that is more complex and tailored to individual needs. Call centers may also use customer hosts running applications used in conjunction with Application Enablement Services (AES) to define call routing and provide associated UUI. The definition and

documentation of those complex applications and associated vectors are beyond the scope of these Application Notes.

5.9.1 Announcements

Various announcements will be used within the vectors. In the sample configuration, these announcements were sourced by the Avaya G450 Media Gateway. The following abridged list command summarizes the announcements used in conjunction with the vectors in this section. To add an announcement extension, use the command “add announcement <extension>”.

list announcement				
ANNOUNCEMENTS/AUDIO SOURCES				
Announcement Extension	Type	Name	Source Pt/Bd/Grp	Num of Files
3696	integrated	Refer-Fail-Announcement	001V9	1
3697	integrated	Pre-REFER-Announcement	001V9	1
3760	integ-rep	Recurring-in-Q-60-Annc	001V9	1

5.9.2 Post-Answer Redirection to a PSTN Destination

This section provides an example configuration of a vector that will use post-answer redirection to a PSTN destination. A corresponding detailed verification is provided in **Section 9.2.2**. In this example, the inbound toll-free call is routed to VDN 3698 shown in the following screen. The originally dialed Verizon IP Toll Free number may be mapped to VDN 3698 by Session Manager digit conversion, or via the incoming call handling treatment for the Communication Manager trunk group handling the call.

display vdn 3698	Page 1 of 3
VECTOR DIRECTORY NUMBER	
Extension: 3698	
Name*: Refer-to-PSTN	
Destination: Vector Number 3	
Attendant Vectoring? n	
Meet-me Conferencing? n	
Allow VDN Override? n	
COR: 1	
TN*: 1	
Measured: none	

VDN 3698 is associated with vector 3, which is shown below. Vector 3 plays an announcement (step 03) to answer the call. After the announcement, the “route-to number” (step 05) includes “~r+17326870755” where the number 732-687-0755 is a PSTN destination. This step causes a REFER message to be sent where the Refer-To header includes “+17326870755” as the user portion. Note that Verizon IP Contact Center services require the “+” in the Refer-To header for this type of call redirection.

display vector 3	Page 1 of 6

02 # Play announcement to caller in step 3. This answers the call.	
03 announcement 3697	
04 # Refer the cal to PSTN Destination in step 5 below.	
05 route-to number ~r+17326870755 with cov n if unconditionally	
06 # If Refer fails play announcement and disconnect	
07 disconnect after announcement 3696	

5.9.3 Post-Answer Redirection With UII to a SIP Destination

This section provides an example of post-answer redirection with UII passed to a SIP destination. A corresponding detailed verification is provided in [Section 9.2.3](#). In this example, the inbound call is routed to VDN 3690 shown in the following screen. The originally dialed Verizon toll-free number may be mapped to VDN 3690 by Session Manager digit conversion, or via the incoming call handling treatment for the Communication Manager trunk group handling the call.

display vdn 3690	Page 1 of 3
VECTOR DIRECTORY NUMBER	
Extension: 3690	
Name*: Refer-with-UII	
Destination: Vector Number 5	
Attendant Vectoring? n	
Meet-me Conferencing? n	
Allow VDN Override? n	
COR: 1	

To facilitate testing of NCR with UII, the following vector variables were defined.

change variables	Page 1 of 39
VARIABLES FOR VECTORS	
Var Description	Type Scope Length Start Assignment VAC
A Test1	asaiuii L 16 1
B Test2	asaiuii L 16 17
C	

VDN 3690 is associated with vector 5, which is shown below. Vector 5 sets data in the vector variables A and B (steps 01 and 02) and plays an announcement to answer the call (step 05). After the announcement, the “route-to” number step includes “~r+18668512649”. This step causes a REFER message to be sent where the Refer-To header includes “+18668512649” as the user portion. The Refer-To header will also contain the UUI set in variables A and B. Verizon will include this UUI in the INVITE ultimately sent to the SIP-connected target of the REFER, which is toll-free number “18668512649”. In the sample configuration, where only one location was used, 866-851-2649 is another toll-free number assigned to the same circuit as the original call. In practice, NCR with UUI would allow Communication Manager to send call or customer-related data along with the call to another contact center.

5.9.4 ACD Configuration for Call Queued for Handling by Agent

This section provides a simple example configuration for VDN, vector, hunt group, and agent logins used to queue inbound Verizon IPCC calls for handling by an agent. This section is not meant to be prescriptive, but rather provides basic information to enable an understanding of the call flow verifications illustrated in Section 9.

The following screens show an example ACD hunt group. On page 1, note the bolded values.

display hunt-group 60	Page 1 of 4
HUNT GROUP	
Group Number: 60	ACD? y
Group Name: ACD-Hunt-60	Queue? y
Group Extension: 3560	Vector? y
Group Type: ucd-mia	
TN: 1	
COR: 1	MM Early Answer? n
Security Code:	Local Agent Preference? n
ISDN/SIP Caller Display:	
Queue Limit: unlimited	

The following screens show an example ACD hunt group. On the abbreviated page 2 shown below, note **Skill** is set to “y”.

display hunt-group 60	Page 2 of 4
HUNT GROUP	
Skill? y	Expected Call Handling Time (sec): 180
AAS? n	

VDN 3660, shown below, is associated with vector 60.

display vdn 3660	Page 1 of 3

Extension: 3660	
Name*: Sales-60	
Destination: Vector Number	60
Attendant Vectoring? n	
Meet-me Conferencing? n	
Allow VDN Override? n	
COR: 1	

In this simple example, vector 60 briefly plays ring back, then queues the call to skill 60. Announcement 3760 is a simple recurring announcement. If an agent is immediately available to handle the call, the call will be delivered to the agent. If an agent is not immediately available, the call will be queued, and the caller will hear the announcement. Once an agent becomes available, the call will be delivered to the agent.

```

5.10. Private Numbering

The “change private-numbering” command may be used to define the format of numbers sent to Verizon in SIP headers such as the “Contact” and “P-Asserted-Identity” headers.

In the bolded rows shown in the example abridged output below, entries are made for the specific Communication Manager Vector Directory Numbers (VDN) illustrated in the prior section. Without this configuration, calls to the VDNs would result in a blank user portion of the Contact header in the 183 with SDP and 200 OK returned to Verizon. Although this did not present any user-perceivable problem in the sample configuration, the configuration in the bolded rows below illustrate how to cause Communication Manager to populate the Contact header with user portions that correspond with a Verizon IPCC number. In the course of the testing, multiple Verizon toll-free numbers were associated with different Communication Manager extensions and functions.

change private-numbering 0					Page 1 of 2
NUMBERING - PRIVATE FORMAT					
Ext	Ext	Trk	Private	Total	
Len	Code	Grp(s)	Prefix	Len	
4	2	3		4	Total Administered: 16
4	3	3		4	Maximum Entries: 540
4	4	3		4	
4	3660	77	8668510107	10	
4	3690	77	8668506850	10	
4	3698	77	8668523221	10	

5.11. Incoming Call Handling Treatment for Incoming Calls

In general, the “incoming call handling treatment” for a trunk group can be used to manipulate the digits received for an incoming call if necessary. Since Session Manager is present, Session Manager can be used to perform digit conversion, and digit manipulation via the Communication Manager incoming call handling table is not necessary. In alternative configurations, if the toll-free number sent by Verizon was not changed before reaching Communication Manager, then the Verizon IPCC number could be mapped to a Communication Manager extension using the incoming call handling treatment of the receiving trunk group. As an example, the following screen illustrates a conversion of toll-free number 8668523221 to extension 2013 when the call arrives on trunk group 77.

change inc-call-handling-trmt trunk-group 77					Page 1 of 30
INCOMING CALL HANDLING TREATMENT					
Service/	Number	Number	Del	Insert	
Feature	Len	Digits			
public-ntwrk	10	8668523221	10	2013	

5.12. Communication Manager Stations

In the sample configuration, four digit station extensions were used with the format 2xxx and 3xxx. Since this configuration is not unique to Verizon, a minimum of information is presented simply to assist in understanding verification traces presented in subsequent sections.

The following abbreviated screen shows an example extension for an Avaya H.323 IP telephone also used by Avaya one-X® Communicator. Call appearances and desired features (e.g., call forwarding, EC500, etc.) can be assigned to the station on page 4 (not shown).

5.13. Saving Communication Manager Configuration Changes

The command “save translation all” can be used to save the configuration.

6. Avaya Aura® Session Manager Configuration for SIP Trunking

This section illustrates relevant aspects of the Session Manager configuration used in the verification of these Application Notes.

Note – The following sections assume that Session Manager and System Manager have been installed and that network connectivity exists between System Manager and Session Manager.

Session Manager is managed via System Manager. Using a web browser, access “https://<ip-addr of System Manager>/SMGR”. In the **Log On** screen, enter appropriate **User ID** and **Password** and press the **Log On** button as shown in the example System Manager 6.2 **Log On** screen below.

Recommended access to System Manager is via FQDN.
[Go to central login for Single Sign-On](#)

If IP address access is your only option, then note that authentication will fail in the following cases:

- First time login with "admin" account
- Expired/Reset passwords

Use the "Change Password" hyperlink on this page to change the password manually, and then login.

Also note that single sign-on between servers in the same security domain is not supported when accessing via IP address.

This system is restricted solely to authorized users for legitimate business purposes only. The actual or attempted unauthorized access, use, or modification of this system is strictly prohibited.

Once logged in, a screen similar to the abridged screen shown below is displayed.

Under the heading “Elements” in the center, select **Routing**. The screen shown below shows the various sub-headings available on the left hand side menu.

▼ Routing
Domains
Locations
Adaptations
SIP Entities
Entity Links
Time Ranges
Routing Policies
Dial Patterns
Regular Expressions
Defaults

The right side of the screen, illustrated below, outlines a series of steps. The sub-sections that follow are in the same order as the steps outlined under **Introduction to Network Routing Policy** in the abridged screen shown below.

Introduction to Network Routing Policy

Network Routing Policy consists of several routing applications like "Domains", "Locations", "SIP Entities", etc.

The recommended order to use the routing applications (that means the overall routing workflow) to configure your network configuration is as follows:

Step 1: Create "Domains" of type SIP (other routing applications are referring domains of type SIP).

Step 2: Create "Locations"

Step 3: Create "Adaptations"

Step 4: Create "SIP Entities"

- SIP Entities that are used as "Outbound Proxies" e.g. a certain "Gateway" or "SIP Trunk"
- Create all "other SIP Entities" (Session Manager, CM, SIP/PSTN Gateways, SIP Trunks)
- Assign the appropriate "Locations", "Adaptations" and "Outbound Proxies"

Step 5: Create the "Entity Links"

- Between Session Managers
- Between Session Managers and "other SIP Entities"

Step 6: Create "Time Ranges"

- Align with the tariff information received from the Service Providers

Step 7: Create "Routing Policies"

- Assign the appropriate "Routing Destination" and "Time Of Day"
- (Time Of Day = assign the appropriate "Time Range" and define the "Ranking")

Step 8: Create "Dial Patterns"

- Assign the appropriate "Locations" and "Routing Policies" to the "Dial Patterns"

Step 9: Create "Regular Expressions"

- Assign the appropriate "Routing Policies" to the "Regular Expressions"

Scroll down to review additional information as shown below. In these Application Notes, all steps are illustrated with the exception of Step 9, since "Regular Expressions" were not used.

Each "Routing Policy" defines the "Routing Destination" (which is a "SIP Entity") as well as the "Time of Day" and its associated "Ranking".

IMPORTANT: the appropriate dial patterns are defined and assigned afterwards with the help of the routing application "Dial patterns". That's why this overall routing workflow can be interpreted as

"Dial Pattern driven approach to define Routing Policies"

That means (with regard to steps listed above):

Step 7: "Routing Policies" are defined

Step 8: "Dial Patterns" are defined and assigned to "Routing Policies" and "Locations" (one step)

Step 9: "Regular Expressions" are defined and assigned to "Routing Policies" (one step)

6.1. Domains

To view or change SIP domains, select **Routing → Domains**. Click on the checkbox next to the name of the SIP domain and **Edit** to edit an existing domain, or the **New** button to add a domain. Click the **Commit** button after changes are completed.

The following screen shows a list of configured SIP domains. The Session Manager used in the verification of these Application Notes was shared among other Avaya interoperability test efforts. The domain “avayalab.com” was used for communication with Avaya SIP Telephones and other Avaya systems and applications. The domain “avayalab.com” is not known to the Verizon production service.

<input type="checkbox"/>	Verizon_Test	VerizonAdapter osrcd=adevc.avaya.globalipcom.com odstd=pcelban0001.avayalincroft.globalipcom.com

The adapter named “SBC-VzB-IPCC” will later be assigned to the SBC SIP Entity. The adapter is configured to apply the parameter “osrcd=adevc.avaya.globalipcom.com”. This configuration enables the source domain to be overwritten with “adevc.avaya.globalipcom.com”. For example,

for inbound toll-free calls from Verizon, the PAI header sent to Verizon in the 200 OK will contain “adevc.avaya.globalipcom.com”. Depending on the Communication Manager configuration, it may not be necessary for Session Manager to adapt the domain in this fashion. In the sample configuration, where “avayalab.com” was already in use in a shared Avaya environment, it was appropriate for Session Manager to adapt the domain from “avayalab.com” to “adevc.avaya.globalipcom.com” where the latter is the CPE domain known to Verizon.

The following screen shows the adaptation details. Although the “DigitConversionAdapter” is used, no conversion of digits is used. This adapter is used to apply the module parameters, and not for digit manipulation.

The adapter named “CM-ES-VZ-IPCC” shown in the following screen will later be assigned to the SIP Entity linking Session Manager to Communication Manager for calls involving Verizon IPCC. This adaptation uses the “DigitConversionAdapter” and specifies the “odstd=avayalab.com”. More specifically, this configuration enables the destination domain to be overwritten with “avayalab.com” for calls that egress to a SIP entity using this adapter. For example, for inbound toll-free calls from Verizon IPCC to the Avaya CPE, the Request-URI header sent to Communication Manager will contain “avayalab.com”, which was the domain used by Communication Manager in the shared Avaya Interoperability Test Lab configuration. Depending on the Communication Manager configuration, it may not be necessary for Session Manager to adapt the domain in this fashion. The parameter “fromto=true” enables Session Manager to adapt the domain in the To header (to “avayalab.com”) as well.

Notes:

Scrolling down, the following screen shows a portion of the “CM-ES-VZ-IPCC” adapter that can be used to convert digits between the Communication Manager extension numbers (user extensions, VDNs) and the toll-free numbers assigned by Verizon.

An example portion of the settings for “Digit Conversion for Outgoing Calls from SM” (i.e., inbound to Communication Manager) is shown below. During the testing, this digit conversion was varied to allow the same toll-free number to be used to test different Communication Manager destinations. The **Notes** in the screen below describe a snapshot of the tests associated with each toll-free number.

Digit Conversion for Outgoing Calls from SM

Add Remove

5 Items Refresh Filter: Enable

<input type="checkbox"/>	Matching Pattern ▲	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes
<input type="checkbox"/>	* 8668502380	* 10	* 10		* 10	3688	both ▼		DTMF Test
<input type="checkbox"/>	* 8668506850	* 10	* 10		* 10	3690	both ▼		Refer-with-UUI Test VDN
<input type="checkbox"/>	* 8668510107	* 10	* 10		* 10	3660	both ▼		Queue to ACD Skill Test VDN
<input type="checkbox"/>	* 8668512649	* 10	* 10		* 10	3660	both ▼		Refer-To Target of UUI Test VDN
<input type="checkbox"/>	* 8668523221	* 10	* 10		* 10	3698	both ▼		Refer-to-PSTN Test VDN

Similarly, an abridged portion of the settings for “Digit Conversion for Incoming Calls to SM” is shown below. Although the direction of actual calls involving Verizon IPCC service are “inbound” to Communication Manager, SIP headers in responses from Communication Manager can be adapted using the “Digit Conversion for Incoming Calls to SM” area.

Digit Conversion for Incoming Calls to SM

Add Remove

2 Items Refresh Filter: Enable

<input type="checkbox"/>	Matching Pattern ▲	Min	Max	Phone Context	Delete Digits	Insert Digits	Address to modify	Adaptation Data	Notes
<input type="checkbox"/>	* 3690	* 4	* 4		* 4	8668506850	both ▼		Refer-with-UUI Test VDN

In general, digit conversion that converts a Verizon IPCC number to a Communication Manager extension can be performed in Communication Manager or in Session Manager. In the example screens shown above, before sending the SIP INVITE to Communication Manager, Session Manager would adapt a received number of 8668506850 to the VDN 3690 associated with testing Refer with UUI. As such, it would not be necessary to use the incoming call handling table of the

receiving Communication Manager trunk group to convert the toll-free number to its corresponding extension.

6.4. SIP Entities

To view or change SIP entities, select **Routing → SIP Entities**. Click the checkbox corresponding to the name of an entity and **Edit** to edit an existing entity, or the **New** button to add an entity. Click the **Commit** button after changes are completed.

The following screen shows the upper portion of the **SIP Entity Details** corresponding to “ASM-62”. The **FQDN or IP Address** field for “ASM-62” is the Session Manager Security Module IP Address (10.80.140.160), which is used for SIP signaling with other networked SIP entities. The **Type** for this SIP entity is “Session Manager”. Select an appropriate location for the Session Manager from the **Location** drop-down menu. In the shared test environment, the Session Manager used location “Location_140”. The default **SIP Link Monitoring** parameters may be used. Unless changed elsewhere, links from other SIP entities to this instance of Session Manager will use the default SIP Link Monitoring timers, configurable at the Session Manager level. If desired, these timers may be customized for each entity.

SIP Link Monitoring: Use Session Manager Configuration

The following screen shows a portion of the **SIP Entity Details** corresponding to a Communication Manager SIP Entity named “CM6.2” This is the SIP Entity that was already in place in the shared Avaya Interoperability Test Lab environment, prior to adding the Verizon IPCC configuration. The **FQDN or IP Address** field contains the IP Address of the “processor Ethernet” (10.80.140.146). In systems with Avaya G650 Media Gateways containing C-LAN cards, C-LAN cards may also be used as SIP entities, instead of, or in addition to, the “processor Ethernet”. “CM” is selected from the **Type** drop-down menu.

SIP Link Monitoring

SIP Link Monitoring:

Use Session Manager Configuration

The following screen shows the **SIP Entity Details** for an entity named “CM-Evolution-procr-5063”. This entity uses the same **FQDN or IP Address** (10.80.140.146) as the prior entity with name “CM6.2”; both correspond to the Communication Manager Processor Ethernet IP Address. Later, a unique port, 5063, will be used for the Entity Link to “CM-Evolution-procr-5063”. Using a different port is one approach that will allow Communication Manager to distinguish traffic originally from Verizon IPCC from other SIP traffic arriving from the same IP Address of the Session Manager, such as SIP traffic associated with SIP Telephones or other SIP-integrated applications. The adapter “CM-ES-VZ-IPCC” is applied to this SIP entity. Recall that this adapter is used to adapt the domain as well as map the Verizon IPCC toll-free numbers to the corresponding Communication Manager extensions. If desired, a location can be assigned if location-based routing criteria will be used.

6.5. Entity Links

To view or change Entity Links, select **Routing → Entity Links**. Click on the checkbox corresponding to the name of a link and **Edit** to edit an existing link, or the **New** button to add a link. Click the **Commit** button after changes are completed.

Note – In the Entity Link configurations below (and in the Communication Manager SIP trunk configuration), TCP was selected as the transport protocol for the Avaya CPE in the sample configuration. TCP was used to facilitate trace analysis during network verification. TLS may be used between Communication Manager and Session Manager in customer deployments.

The following screen shows a list of configured links. In the screen below, the links named “Sipera-SBC-2” and “CM-ES-VZ-5063” are most relevant to these Application Notes. Each link uses the entity named “ASM-62” as **SIP Entity 1**, and the appropriate entity, such as “Avaya-

SBCE-2”, for **SIP Entity 2**. Note that there are multiple SIP Entity Links, using different TCP ports, linking the same “ASM-62” with the processor Ethernet of Communication Manager. For example, for one link, named “ASM_to_CM”, both entities use TCP and port 5060. For the entity link used by Verizon IPCC named “CM-ES-VZ-5063”, both entities use TCP and port 5063.

Home / Elements / Routing / Entity Links

<input type="checkbox"/>	<a>CM-ES-VZ-5062	ASM-62	TCP	<a>5062	CM-Evolution-procr-5062	<a>5062	Trusted	<a>VS IPT
<input type="checkbox"/>	<a>CM-ES-VZ-5063	ASM-62	TCP	<a>5063	CM-Evolution-procr-5063	<a>5063	Trusted	<a>VZ IPCC
<input type="checkbox"/>	<a>Sipera-SBC-1	ASM-62	TCP	<a>5060	Avaya-SBCE-1	<a>5060	Trusted	<a>SBC-Outside-2222
<input type="checkbox"/>	<a>Sipera-SBC-2	ASM-62	TCP	<a>5060	Avaya-SBCE-2	<a>5060	Trusted	<a>SBC-Outside-1112

The link named “ASM_to_CM” links Session Manager “ASM-62” with the Communication Manager processor Ethernet. This link existed in the configuration prior to adding the Verizon IPCC-related configuration. This link, using port 5060, can carry traffic between Session Manager and Communication Manager that is not necessarily related to calls with Verizon, such as traffic related to SIP Telephones registered to Session Manager.

The link named “CM-ES-VZ-5063” also links Session Manager “ASM-62” with the Communication Manager processor Ethernet. However, this link uses port 5063 for both entities in the link. This link was created to allow Communication Manager to distinguish calls from Verizon IPCC from other calls that arrive from the same Session Manager. Other methods of distinguishing traffic could be used, if desired.

6.6. Time Ranges

To view or change Time Ranges, select **Routing → Time Ranges**. The Routing Policies shown subsequently will use the “24/7” range since time-based routing was not the focus of these Application Notes. Click the **Commit** button after changes are completed.

Home / Elements / Routing / Time Ranges

6.7. Routing Policies

To view or change routing policies, select **Routing → Policies**. Click on the checkbox corresponding to the name of a policy and **Edit** to edit an existing policy, or **New** to add a policy. Click the **Commit** button after changes are completed.

The following screen shows the **Routing Policy Details** for the policy named “CM-ES-VZIPCC” associated with incoming toll-free calls from Verizon IPCC to Communication Manager. Observe the **SIP Entity as Destination** is the entity named “CM-Evolution-procr-5063” which uses the Communication Manager processor Ethernet IP Address (10.80.140.146).

6.8. Dial Patterns

To view or change dial patterns, select **Routing → Dial Patterns**. Click on the checkbox corresponding to the name of a pattern and **Edit** to edit an existing pattern, or **New** to add a pattern. Click the **Commit** button after changes are completed.

The following screen illustrates an example dial pattern used to verify an inbound IPTF call to the enterprise. When a user on the PSTN dials a toll-free number such as 866-850-6850, Verizon delivers the number to the enterprise, and the SBC sends the call to Session Manager. The dial pattern below matches on 866-850-6850 specifically. Dial patterns can alternatively match on ranges of numbers. Under **Originating Location and Routing Policies**, the routing policy named “CM-ES-VZIPCC” is selected, which sends the call to Communication Manager using the routing policy destination “CM-Evolution-procr-5063” as described previously. The **Originating Location Name** is “Avaya-SBCE-2”.

7. Avaya Session Border Controller for Enterprise

In the sample configuration, an Avaya Session Border Controller for Enterprise is used as the edge device between the Avaya CPE and Verizon Business.

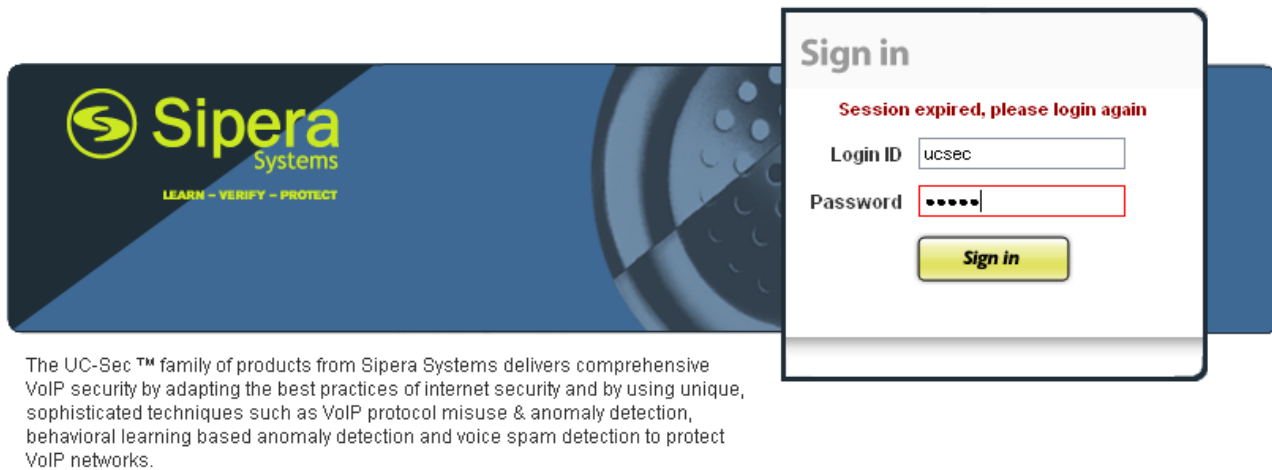

These Application Notes assume that the installation of the SBC and the assignment of a management IP Address have already been completed.

7.1. Access the Management Interface

Access the web management interface by entering <https://<ip-address>> where <ip-address> is the management IP address assigned during installation. Select **UC-Sec Control Center**.

A log in screen is presented. Enter an appropriate **Login ID** and **Password**.

[Visit the Sipera Systems website to learn more.](#)

NOTICE TO USERS: This system is for authorized use only. Unauthorized use of this system is strictly prohibited. Unauthorized or improper use of this system may result in civil and/or criminal penalties. Use of this system constitutes consent to security monitoring. All activity is logged with login info, host name and IP address.

Once logged in, a UC-Sec Control Center screen will be presented. The following image illustrates the menu items available on the left-side of the UC-Sec Control Center screen.

7.2. Commission the System

From the UC-Sec Control Center menu, select **System Management**.

If the system has not yet been “commissioned”, a screen such as the following will appear. The **Status** will show “Registered”. Run the installation wizard by clicking the  icon.

System Management					
Installed		Updates			
Device Name	Serial Number	Version	Status		
SS_10_80_140_199	IPCS31020091	4.0.4.Q138	 Registered		

An installation wizard will appear. In the **Appliance Name** field, enter an appropriate name. In the sample configuration, “Sipera-outside-1112” was entered. In the **Choose your box type** area, choose SIP. Click **Next**.

7.3.2 Server Interworking – Verizon IPCC

Click the **Add Profile** button (not shown) to add a new profile or select an existing interworking profile. If adding a profile, a screen such as the following is displayed. Enter an appropriate **Profile Name** such as “Verizon-IPCC” shown below. Click **Next**.

Interworking Profile

Profile Name

Verizon-IPCC

Next

The following screens illustrate the “General” parameters used in the sample configuration for the Interworking Profile named “Verizon-IPCC”. Most parameters retain default values. In the sample configuration, **T.38 support** was set to “No”, **Hold Support** was set for RFC3264, and **180 Handling** was set to “No SDP” (as noted earlier, this is optional. Communication Manager has been configured to send 183 with SDP in the sample configuration, so SDP will not be present in 180 anyway).

7.4. Global Profiles – Server Configuration

Select **Global Profiles** → **Server Configuration** from the left-side menu as shown below.

7.4.1 Server Configuration for Session Manager

Click the **Add Profile** button (not shown) to add a new profile, or select an existing profile to edit. If adding a profile, a screen such as the following is displayed. Enter an appropriate Profile Name such as “Avaya_SM” shown below. Click **Next**.

The screenshot shows a dialog box titled "Add Server Configuration Profile". It has a close button (X) in the top right corner. Below the title bar, there is a text input field labeled "Profile Name" which contains the text "Avaya_SM". A red rectangle is drawn around the "Avaya_SM" text. Below the input field, there is a button labeled "Next".

The following screens illustrate the Server Configuration with Profile name “Avaya_SM”. In the “General” parameters, select “Call Server” from the **Server Type** drop-down menu. In the **IP Addresses / Supported FQDNs** area, the IP Address of the Session Manager SIP signaling interface in the sample configuration is entered. This IP Address is 10.80.140.160. In the **Supported Transports** area, TCP is selected, and the **TCP Port** is set to 5060. This configuration corresponds with the Session Manager entity link configuration for the entity link to the SBC. If adding a new profile, click **Next**. If editing an existing profile, click **Finish**.

Server Type	Call Server 
IP Addresses / Supported FQDNs Comma separated list	10.80.140.160 
Supported Transports	<input checked="" type="checkbox"/> TCP <input type="checkbox"/> UDP <input type="checkbox"/> TLS
TCP Port	5060
UDP Port	5060
TLS Port	

Once configuration is completed, the **General** tab for “Avaya_SM” will appear as shown below.

[Rename Profile](#)

Supported Transports	TCP
TCP Port	5060

[Edit](#)

If adding the profile, click **Next** to accept default parameters for the **Authentication** tab, and advance to the **Heartbeat** area. If editing an existing profile, select the **Heartbeat** tab and click edit.

The SBC can be configured to source “heartbeats” in the form of SIP OPTIONS. In the sample configuration, with one Session Manager, this configuration is optional.

If SBC-sourced OPTIONS messages are desired, check the **Enable Heartbeat** box. Select “OPTIONS” from the **Method** drop-down menu. Select the desired frequency that the SBC will source OPTIONS to this server. The **From URI** and **To URI** may be filled in to configure easily identifiable URIs to appear in SIP OPTIONS sourced by the SBC toward Session Manager. If adding a new profile, click **Next**. If editing an existing profile, click **Finish**.

Enable Heartbeat	<input checked="" type="checkbox"/>
Method	OPTIONS ▼
Frequency	60 seconds
From URI	ping@10.80.140.200
To URI	ping@10.80.140.160

TCP Connection Type	SUBID

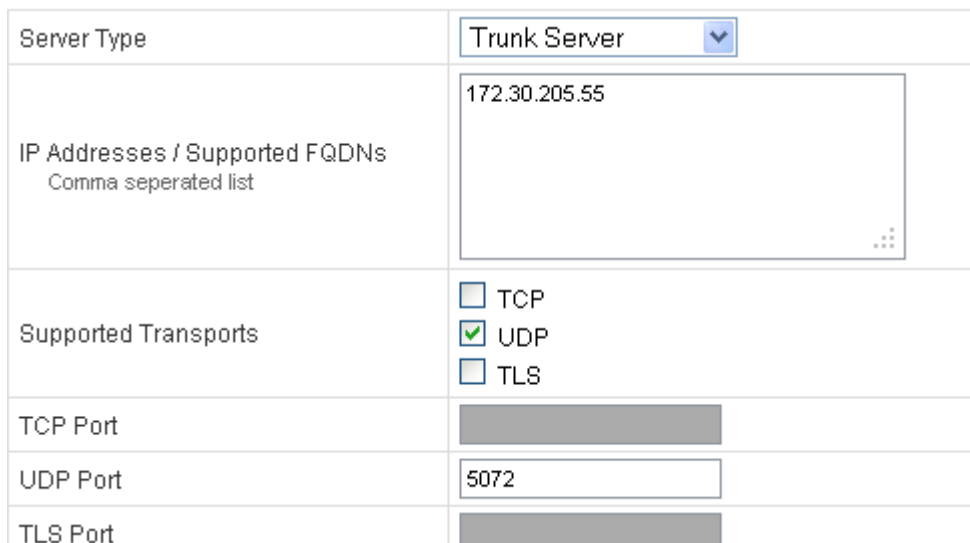

7.4.2 Server Configuration for Verizon IPCC

Click the **Add Profile** button (not shown) to add a new profile, or select an existing profile to edit. If adding a profile, a screen such as the following is displayed. Enter an appropriate Profile Name such as “VZ-IPCC” shown below. Click **Next**.

The screenshot shows a dark header bar with the text "Add Server Configuration Profile" and a red close button. Below the header is a form with a "Profile Name" label and a text input field containing "VZ-IPCC". A "Next" button is centered below the input field.

The following screens illustrate the Server Configuration with Profile name “VZ_IPCC”. In the “General” parameters, select “Trunk Server” from the **Server Type** drop-down menu. In the **IP Addresses / Supported FQDNs** area, the Verizon-provided Verizon IPCC IP Address is entered. This IP Address is 172.30.205.55. In the **Supported Transports** area, UDP is selected, and the **UDP Port** is set to 5072.

The screenshot displays a configuration form with the following fields and values:

Field	Value
Server Type	Trunk Server
IP Addresses / Supported FQDNs <small>Comma separated list</small>	172.30.205.55
Supported Transports	<input type="checkbox"/> TCP <input checked="" type="checkbox"/> UDP <input type="checkbox"/> TLS
TCP Port	
UDP Port	5072
TLS Port	

If adding the profile, click **Next** to accept default parameters for the **Authentication** tab, and advance to the **Heartbeat** area. If editing an existing profile, select the **Heartbeat** tab and click edit.

The SBC can be configured to source “heartbeats” in the form of SIP OPTIONS towards Verizon. This configuration is optional. Independent of whether the SBC is configured to source SIP OPTIONS towards Verizon, Verizon will receive OPTIONS from the enterprise site as a result of the SIP Entity Monitoring configured for Session Manager. When Session Manager sends SIP OPTIONS to the inside private IP Address of the SBC, the SBC will send SIP OPTIONS to Verizon. When Verizon responds, the SBC will pass the response to Session Manager.

If SBC-sourced OPTIONS are desired, select “OPTIONS” from the **Method** drop-down menu. Select the desired frequency that the SBC will source OPTIONS. The **From URI** and **To URI** may be filled in to configure easily identifiable URIs to appear in SIP OPTIONS sourced by the SBC. If adding a new profile, click **Next**. If editing an existing profile, click **Finish**.

Enable Heartbeat	<input checked="" type="checkbox"/>
Method	OPTIONS 
Frequency	60 seconds
From URI	ping@1.1.1.2
To URI	ping@172.30.205.55
TCP Probe	<input type="checkbox"/>
TCP Probe Frequency	<div></div> seconds

Finish

If the optional SBC sourced OPTIONS configuration is completed, the **Heartbeat** tab for “VZ-IPCC” will appear as shown below.

General	Authentication	Heartbeat	Advanced
----------------	-----------------------	------------------	-----------------

Heartbeat	
Enable Heartbeat	<input checked="" type="checkbox"/>
Method	OPTIONS
Frequency	60 seconds
From URI	ping@1.1.1.2
To URI	ping@172.30.205.55
TCP Probe	<input type="checkbox"/>

If adding a profile, click **Next** to continuing to the “Advanced” settings. If editing an existing profile, select the **Advanced** tab and **Edit**. In the resultant screen, select the **Interworking Profile** “Verizon-IPCC” created previously. Other SBC features, such as DoS Protection and Grooming, can be configured according to customer preference. Click **Finish**.

Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	Verizon-IPCC 
Signaling Manipulation Script	None 
UDP Connection Type	<input checked="" type="radio"/> SUBID <input type="radio"/> PORTID <input type="radio"/> MAPPING

Finish

Once configuration is completed, the **Advanced** tab for “VZ-IPCC” will appear as shown below.

Advanced	
Enable DoS Protection	<input type="checkbox"/>
Enable Grooming	<input type="checkbox"/>
Interworking Profile	Verizon-IPCC
Signaling Manipulation Script	None
UDP Connection Type	SUBID

7.5. Global Profiles – Routing

Select **Global Profiles → Routing** from the left-side menu as shown below.

7.5.1 Routing Configuration for Session Manager

Click the **Add Profile** button (not shown) to add a new profile, or select an existing routing profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “To_Avaya” shown below. Click **Next**.

Routing Profile ✕

Profile Name

To_Avaya

Next

For the **Next Hop Routing**, enter the IP Address of the Session Manager SIP signaling interface as **Next Hop Server 1**, as shown below. Check **Routing Priority based on Next Hop Server**. Choose **TCP** for **Outgoing Transport**.

Each URI group may only be used once per Routing Profile.

Next Hop Routing	
URI Group	<input type="text" value="*"/>
Next Hop Server 1	<input type="text" value="10.80.140.160"/> IP, IP:Port, Domain, or Domain:Port
Next Hop Server 2	<input type="text"/> IP, IP:Port, Domain, or Domain:Port
<input checked="" type="checkbox"/> Routing Priority based on Next Hop Server <input type="checkbox"/> Use Next Hop for In Dialog Messages <input type="checkbox"/> Ignore Route Header for Messages Outside Dialog	
<input type="checkbox"/> NAPTR <input type="checkbox"/> SRV	
Outgoing Transport	<input type="radio"/> TLS <input checked="" type="radio"/> TCP <input type="radio"/> UDP

Once configuration is completed, the **Routing Profile** for “To_Avaya” will appear as follows.

Routing Profile										
										<input type="button" value="Add Routing Rule"/>
Priority	URI Group	Next Hop Server 1	Next Hop Server 2	Next Hop Priority	NAPTR	SRV	Next Hop in Dialog	Ignore Route Header	Outgoing Transport	
<input type="text" value="1"/>	*	10.80.140.160	---	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	TCP	

7.5.2 Routing Configuration for Verizon IPCC

Click the **Add Profile** button (not shown) to add a new profile, or select an existing routing profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “VZ-IPCC” shown below. Click **Next**.

Routing Profile	
Profile Name	<input type="text" value="VZ-IPCC"/>

For the **Next Hop Server 1**, enter the IP Address of the Verizon IPCC service, a colon, and the port to be used (e.g., 172.30.205.55:5072) as shown in the screen below. Check **Routing Priority based on Next Hop Server**. Choose **UDP** for **Outgoing Transport**.

Each URI group may only be used once per Routing Profile.

Next Hop Routing	
URI Group	<input type="text" value="*"/>
Next Hop Server 1	<input type="text" value="172.30.205.55:5072"/> IP, IP:Port, Domain, or Domain:Port
Next Hop Server 2	<input type="text"/> IP, IP:Port, Domain, or Domain:Port
<input checked="" type="checkbox"/> Routing Priority based on Next Hop Server	
<input type="checkbox"/> Use Next Hop for In Dialog Messages	
<input type="checkbox"/> Ignore Route Header for Messages Outside Dialog	
<input type="checkbox"/> NAPTR <input type="checkbox"/> SRV	
Outgoing Transport	<input type="radio"/> TLS <input type="radio"/> TCP <input checked="" type="radio"/> UDP

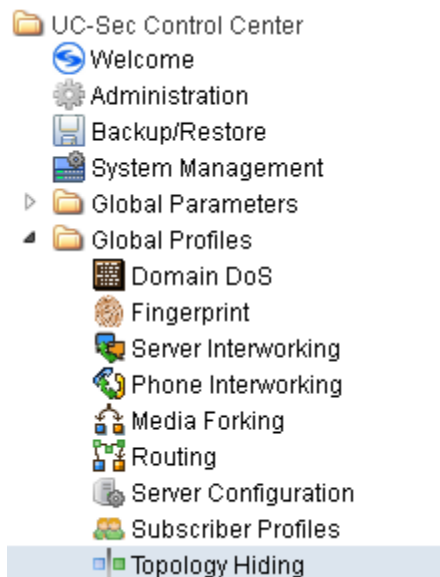

Finish

Once configuration is completed, the **Routing Profile** for “VZ-IPCC” will appear as follows.

Routing Profile										
										Add Routing Rule
Priority	URI Group	Next Hop Server 1	Next Hop Server 2	Next Hop Priority	NAPTR	SRV	Next Hop in Dialog	Ignore Route Header	Outgoing Transport	
1	*	172.30.205.55:5072	---	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	UDP	

7.6. Global Profiles – Topology Hiding

Select **Global Profiles** → **Topology Hiding** from the left-side menu as shown below.

7.6.1 Topology Hiding for Session Manager

Click the **Add Profile** button (not shown) to add a new profile, or select an existing topology hiding profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “Avaya” shown below. Click **Next**.

Topology Hiding Profile

Profile Name: Avaya

Next

In the resultant screen, click the **Add Header** button in the upper right to reveal additional headers.

Add Header

Header	Criteria	Replace Action	Overwrite Value
Request-Line	IP/Domain	Auto	

If it is desired to ensure that the domain received by Session Manager from the SBC is the expected enterprise domain, select “Overwrite” as the **Replace Action** for the To, From, and Request-Line headers. Enter the enterprise domain in the **Overwrite Value** column as shown below. In the example below, the domain received by Session Manager is changed by the SBC to “avayalab.com”. Click **Finish**.

Header	Criteria	Replace Action	Overwrite Value	
Record-Route	IP/Domain	Auto		✗
Via	IP/Domain	Auto		✗
To	IP/Domain	Overwrite	avayalab.com	✗
From	IP/Domain	Overwrite	avayalab.com	✗
Request-Line	IP/Domain	Overwrite	avayalab.com	✗
SDP	IP/Domain	Auto		✗

Finish

After configuration is completed, the Topology Hiding for profile “Avaya” will appear as follows.

Topology Hiding

Header	Criteria	Replace Action	Overwrite Value
Record-Route	IP/Domain	Auto	---
Via	IP/Domain	Auto	---
To	IP/Domain	Overwrite	avayalab.com
From	IP/Domain	Overwrite	avayalab.com
Request-Line	IP/Domain	Overwrite	avayalab.com
SDP	IP/Domain	Auto	---

7.6.2 Topology Hiding for Verizon IPCC

Click the **Add Profile** button (not shown) to add a new profile, or select an existing topology hiding profile to edit. If adding a profile, a screen such as the following is displayed. Enter a **Profile Name** such as “VZ-IPCC” shown below. Click **Next**.

Topology Hiding Profile	
Profile Name	VZ-IPCC

Next

In the resultant screen, click the **Add Header** button in the upper right to reveal additional headers until the final screen appears as follows. The default “Auto” behaviors are sufficient. Click **Finish**.

Header	Criteria	Replace Action	Overwrite Value	
Record-Route	IP/Domain	Auto		✗
Via	IP/Domain	Auto		✗
To	IP/Domain	Auto		✗
From	IP/Domain	Auto		✗
Request-Line	IP/Domain	Auto		✗
SDP	IP/Domain	Auto		✗

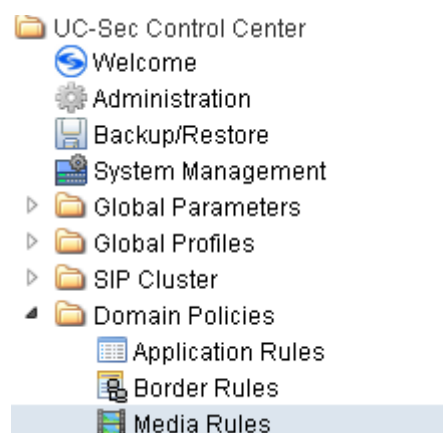

Finish

After configuration is completed, the **Topology Hiding** for profile “VZ-IPCC” will appear as follows.

Topology Hiding				
Header	Criteria	Replace Action	Overwrite Value	
Record-Route	IP/Domain	Auto	---	
Via	IP/Domain	Auto	---	
To	IP/Domain	Auto	---	
From	IP/Domain	Auto	---	
Request-Line	IP/Domain	Auto	---	
SDP	IP/Domain	Auto	---	

7.7. Domain Policies – Media Rules

Select **Domain Policies** → **Media Rules** from the left-side menu as shown below.

In the sample configuration, a single media rule was created by cloning the default rule called “default-low-med”. Select the default-low-med rule and click the **Clone Rule** button.

Domain Policies > Media Rules: default-low-med

Add Rule Filter By Device... **Clone Rule**

Media Rules

default-low-med

It is not recommended to edit the defaults. Try cloning or adding a new rule instead.

Media NAT Media Encryption Media Anomaly Media Silencing **Media QoS** Turing Test

Enter a name in the **Clone Name** field, such as “default-low-med-QoS” as shown below. Click **Finish**.

Clone Rule

Rule Name	default-low-med
Clone Name	default-low-med-QoS

Finish

Select the newly created rule, select the **Media QoS** tab, and click the **Edit** button (not shown). In the resulting screen, check the **Media QoS Marking Enabled** checkbox. Select **DSCP** and select “EF” for expedited forwarding as shown below. Click **Finish**.

10.80.140.200		10.80.140.1	A1	✗
1.1.1.2		1.1.1.1	B1	✗

Select the **Interface Configuration** tab. The **Administrative Status** can be toggled between “Enabled” and “Disabled” in this screen. The following screen was captured after the interfaces had already been enabled. To enable the interface if it is disabled, click the **Toggle State** button.

Network Configuration		Interface Configuration
Name	Administrative Status	
A1	Enabled	Toggle State
A2	Disabled	Toggle State
B1	Enabled	Toggle State
B2	Disabled	Toggle State

7.11. Device Specific Settings – Media Interface

Select **Device Specific Setting** → **Media Interface** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “Sipera-outside-1112” in the sample configuration (not shown). Select **Add Media Interface**.

Enter an appropriate **Name** for the media interface for the Avaya CPE and select the inside private IP Address from the **IP Address** drop-down menu. In the sample configuration, “Int_Media_to_CPE” is chosen as the name, and the “inside” IP Address of the SBC is “10.80.140.200”. For the **Port Range**, default values are shown. Click **Finish**.

Add Media Interface ✕

Name	Int_Media_to_CPE
IP Address	10.80.140.200 ▼
Port Range	35000 - 40000

Finish

Once again, select **Add Media Interface**. Enter an appropriate **Name** for the media interface for the public “outside” of the SBC, and select the outside public IP Address from the **IP Address** drop-down menu. In the sample configuration, “Ext_Media_to_VZ” is chosen as the name, and the “outside” public IP Address of the SBC is “1.1.1.2”. For the **Port Range**, default values are shown. Verizon IPCC does not require that the RTP ports be chosen within a specific range. Click **Finish**.

Add Media Interface ✕

Name	Ext_Media_to_VZ
IP Address	1.1.1.2 ▼
Port Range	35000 - 40000

Finish

The resultant Media Interface configuration used in the sample configuration is shown below.

be: Sipera-outside-1112

Media Interface ✕

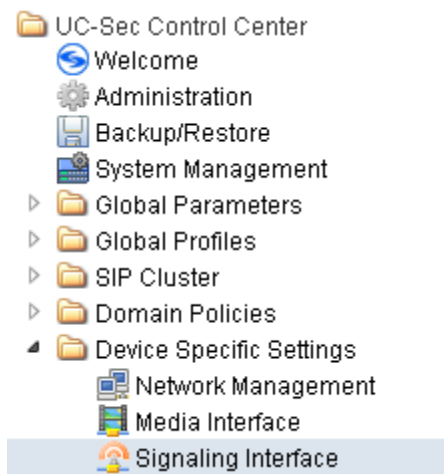

Modifying or deleting an existing media interface will require an application restart before taking effect. Application restarts can be issued from [System Management](#).

Add Media Interface

Name	Media IP	Port Range		
Int_Media_to_CPE	10.80.140.200	35000 - 40000	✎	✕
Ext_Media_to_VZ	1.1.1.2	35000 - 40000	✎	✕

7.12. Device Specific Settings – Signaling Interface

Select **Device Specific Setting** → **Signaling Interface** from the left-side menu as shown below.

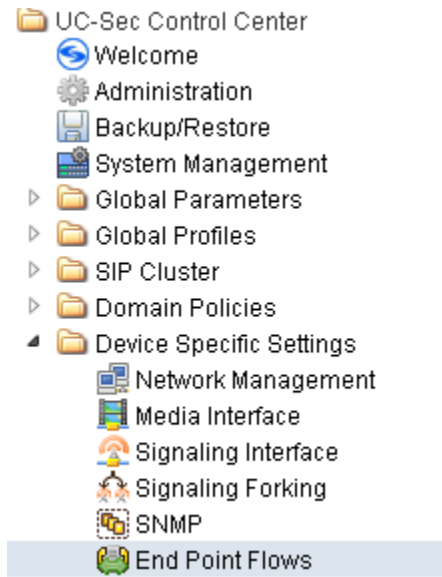

Under **UC-Sec Devices**, select the device being managed, which was named “Sipera-outside-1112” in the sample configuration (not shown). Select **Add Signaling Interface**.

In the Add Signaling Interface screen, enter an appropriate **Name** (e.g., “Sig_Inside_to_CPE”) for the “inside” private interface, and choose the private inside IP Address (e.g., 10.80.140.200) from the **IP Address** drop-down menu. Choose **TCP Port** “5060” since TCP and port 5060 is used between Session Manager and the SBC in the sample configuration. Click **Finish**.

7.13. Device Specific Settings – End Point Flows

Select **Device Specific Setting** → **End Point Flows** from the left-side menu as shown below.

Under **UC-Sec Devices**, select the device being managed, which was named “Sipera-outside-1112” in the sample configuration (not shown). Select the **Server Flows** tab. Select **Add Flow**.

The following screen shows the flow named “Avaya_SM” being added to the sample configuration. This flow uses the interfaces, policies, and profiles defined in previous sections. Click **Finish**.

Add Flow 

Criteria	
Flow Name	<input type="text" value="Avaya_SM"/>
Server Configuration	<input type="text" value="Avaya_SM"/>

8. Verizon Business IPCC Services Suite Configuration

Information regarding Verizon Business IPCC Services suite offer can be found at <http://www.verizonbusiness.com/products/contactcenter/ip/> or by contacting a Verizon Business sales representative.

The reference configuration described in these Application Notes was located in the Avaya Solutions and Interoperability Test Lab. Access to the Verizon Business IPCC Services suite was via a Verizon Private IP (PIP) T1 connection. Verizon Business provided all of the necessary service provisioning.

8.1. Service Access Information

The following service access information (FQDN, IP addressing, ports, IP toll free numbers) was provided by Verizon for the sample configuration.

CPE (Avaya)	Verizon Network
<i>adevc.avaya.globalipcom.com</i> <i>UDP port 5060</i>	<i>172.30.205.55</i> <i>UDP Port 5072</i>

IP Toll Free Numbers
866-850-2380
866-851-0107
866-851-2649
866-852-3221
866-850-6850

9. Verification Steps

This section provides example verifications of the sample configuration illustrated in these Application Notes.

9.1. Illustration of OPTIONS Handling

This section illustrates SIP OPTIONS monitoring of the SIP trunk from Verizon to the CPE and from the CPE to Verizon through the Avaya Session Border Controller for Enterprise.

9.1.1 Incoming OPTIONS from Verizon IPCC to Avaya CPE

The following screens from a filtered Wireshark trace illustrate OPTIONS sent by Verizon to the Avaya CPE. Verizon IPCC service uses OPTIONS to determine whether the CPE is available to receive inbound calls. Therefore, proper OPTIONS response is necessary. In the trace shown below, taken from the outside public side of the SBC, frame 545 is highlighted and expanded to show OPTIONS sent from Verizon IPCC (172.30.205.55) to the SBC (1.1.1.2). Observe the use of UDP for transport, from source port 5072 (Verizon) to destination port 5060 (Avaya). Verizon sends the Avaya domain “adevc.avaya.globalipcom.com” in the Request-Line. Note that Max-Forwards is 70.

No. ->	Time	Source	Destination	Protocol	Info

Max-Forwards: 70
CSeq: 50552 OPTIONS

Before the SBC replies to Verizon, the SBC sends OPTIONS to Session Manager on the inside private interface. In the trace shown below, taken from the inside private side of the SBC, frame 997 is highlighted and expanded to show OPTIONS sent from the inside interface of the SBC (10.80.140.200) to Session Manager (10.80.140.160). Observe the use of TCP for transport, using port 5060. Observe that the SBC has changed the Request-URI, From, and To headers per the previous configuration such that “avayalab.com” now appears. Note that Max-Forwards has been decremented by 1 and is now 69.

Filter: sip		Expression... Clear Apply			
No. -	Time	Source	Destination	Protocol	Info

<div> <div>Internet Protocol, Src: 10.80.140.200 (10.80.140.200), Dst: 10.80.140.160 (10.80.140.160)</div> <div>Transmission Control Protocol, Src Port: entextxid (12000), Dst Port: sip (5060), Seq: 1, Ack: 2, Len: 393</div> <div>Session Initiation Protocol <div>Request-Line: OPTIONS sip:avaya lab.com SIP/2.0</div> <div>Message Header <div>From: <sip:ping@avaya lab.com>; tag=49edff42f58e6f6155e3449f93a5642a000acs1</div> <div>To: sip:ping@avaya lab.com</div> <div>CSeq: 50552 OPTIONS</div> <div>Call-ID: 907adb2f2d9d6c6860e2c84a903e795e</div> <div>Record-Route: <sip:10.80.140.200:5060;ipcs-line=18755;lr;transport=tcp></div> <div>Max-Forwards: 69</div> <div>Via: SIP/2.0/TCP 10.80.140.200:5060;branch=z9hg4bk-s1632-001505359549-1--s1632-</div> <div>Content-Length: 0</div> </div> </div> </div>					

In this same trace, highlighted frame 998 below shows Session Manager responding to the OPTIONS with 200 OK. Although not shown below, note that Session Manager includes a “Server” header in the 200 OK, where the “Server” headers will contain a string like “Avaya-SM-6.2<more>” where <more> further identifies the Session Manager release.

No. -	Time	Source	Destination	Protocol	Info
997	34.985891	10.80.140.200	10.80.140.160	SIP	Request: OPTIONS sip:avaya lab.com

<div> <div>Internet Protocol, Src: 10.80.140.160 (10.80.140.160), Dst: 10.80.140.200 (10.80.140.200)</div> <div>Transmission Control Protocol, Src Port: sip (5060), Dst Port: entextxid (12000), Seq: 2, Ack: 394, Len: 536</div> <div>Session Initiation Protocol <div>Status-Line: SIP/2.0 200 OK</div> <div>Message Header <div>Via: SIP/2.0/TCP 10.80.140.200:5060;branch=z9hg4bk-s1632-001505359549-1--s1632-</div> <div>To: sip:ping@avaya lab.com;tag=1012819428*1*016asm-callprocessing.sar-1601417206~1328646177948~-1272789723~1</div> <div>From: <sip:ping@avaya lab.com>; tag=49edff42f58e6f6155e3449f93a5642a000acs1</div> <div>Call-ID: 907adb2f2d9d6c6860e2c84a903e795e</div> <div>CSeq: 50552 OPTIONS</div> </div> </div> </div>					

Returning to the outside trace, and advancing to frame 546, the 200 OK sent back to the inbound OPTIONS from Verizon is illustrated below. The receipt of a valid OPTIONS response from the CPE is necessary for Verizon to route inbound calls to the CPE. Since the SBC proxies the OPTIONS received from Verizon to Session Manager, the end to end path from Verizon through to Session Manager must be in-service for OPTIONS (and ultimately calls) to be successful.

No. -	Time	Source	Destination	Protocol	Info

9.1.2 Outbound OPTIONS from Avaya CPE to Verizon IPCC

The following screens from filtered Wireshark traces illustrate OPTIONS sent by the Avaya CPE to Verizon IPCC. In the trace shown below, taken from the inside private interface of the SBC, frame 6338 is highlighted and expanded to show OPTIONS sent from the Session Manager SIP signaling interface (10.80.140.160) to the inside address of the SBC (10.80.140.200). Observe the use of TCP for transport using port 5060. Session Manager can send OPTIONS due to the SIP Entity Link Monitoring function. Note that Max-Forwards is 67 reflecting internal processing of the OPTIONS within Session Manager before it is sent to the destination SIP entity, in this case, the SBC.

No.	Time	Source	Destination	Protocol	Info

Returning to the inside private trace, the 200 OK from Verizon IPCC triggers the 200 OK back to Session Manager as shown in highlighted frame 6346 below. Note the “Server” header inserted by the Verizon IPCC server appears in this 200 OK sent back to Session Manager. Session Manager will consider the SIP Entity to the SBC “up”.

As a result of the SBC relaying SIP OPTIONS from Verizon to Session Manager, and also relaying SIP OPTIONS from Session Manager to Verizon, SIP OPTIONS monitoring of the SIP trunk does not require the SBC to source its own SIP OPTIONS via the “heartbeat” capability, although that capability is also available if desired.

9.2. Communication Manager and Wireshark Trace Call Verifications

This section illustrates verifications using Communication Manager and Wireshark to illustrate key SIP messaging and call flows.

9.2.1 Example Incoming Call from PSTN via Verizon IPCC to Telephone

Incoming toll-free calls arrive from Verizon at the Avaya SBCE, which sends the call to Session Manager. Session Manager sends the call to Communication Manager via the entity link corresponding to Communication Manager processor Ethernet using port 5063. On Communication Manager, the incoming call arrives via signaling group 77 and trunk group 77.

The following screen shows an abridged output of “list registered-ip-stations”, showing that the station with extension 2013 is a one-X Communicator with IP Address 10.10.103.97. As a result of the ip-network-map, this station is considered to be in network region 5.

list registered-ip-stations					
REGISTERED IP STATIONS					
Station Ext or Orig Port	Set Type/ Net Rgn	Prod ID/ Release	TCP Skt	Station IP Address/ Gatekeeper	IP Address
2010	9641	IP_Phone	y	10.80.140.132	
	1	6.020S		10.80.140.146	
2011	9608	IP_Phone	y	10.80.140.133	
	1	6.020S		10.80.140.146	
2013	9630	oneX_Comm	y	10.10.103.97	
	5	6.0100		10.80.140.146	

The following abridged and annotated Communication Manager “list trace” trace output shows a call incoming on trunk group 77. The PSTN (mobile) telephone 7326870755 dialed 866-850-2380. Session Manager can map the number received from Verizon to the extension of a Communication Manager telephone (x2013), or the incoming call handling table for trunk group 77 can do the same. In the trace below, Session Manager had already mapped the Verizon number to the Communication Manager extension. Initially, the G450 Media Gateway (10.80.140.148) is used, but as can be seen in the final trace output, once the call is answered, the final RTP media path is “ip-direct” from the one-X® Communicator (10.10.103.97) to the “inside” or private interface of the Avaya SBC (10.80.140.200).

The following portion of a filtered Wireshark trace (tracing only SIP messages on the public interface on the “outside” of the SBC) shows the same incoming PSTN call. In frame 995, Verizon sends the INVITE to the Avaya SBC (1.1.1.2). Frame 995 is selected and expanded so that the middle portion of the screen can illustrate the contents of the SIP headers and SDP sent by Verizon. The trace shows that the SIP message uses UDP with source port 5072 and destination port 5060. In frame 998, it can be observed that the Avaya CPE responds with 183 with SDP during the ringing phase. When the user answers, the Avaya CPE sends the 200 OK (frame 3474), and after the Verizon ACK (frame 3487), the Avaya CPE sends a re-INVITE (no SDP) to Verizon corresponding to the “shuffling to ip-direct” occurring on the inside interface of the SBC. Verizon responds with 200 OK with SDP (frame 3516), and the Avaya CPE responds with an ACK with SDP in frame 3519.

The following screen is an example taken from the one-X® Communicator client for this call.

9.2.2 Example Incoming Call Referred via Call Vector to PSTN Destination

The following edited and annotated Communication Manager “list trace” trace output shows a call incoming on trunk group 77. The call was routed to a Communication Manager vector directory number (VDN 3698) associated with a call vector (call vector 3). The vector answers the call, plays an announcement to the caller, and then uses a “route-to” step to cause a REFER message to be sent with a Refer-To header containing the number configured in the vector “route-to” step. The PSTN telephone dialed 866-852-3221. Session Manager can map the number received from Verizon to the VDN extension (x3698), or the incoming call handling table for trunk group 77 can do the same. In the trace below, Session Manager had already mapped the Verizon number to the Communication Manager VDN extension. The annotations in the edited trace highlight key behaviors. At the conclusion, the PSTN caller that dialed the Verizon toll-free number is talking to the Referred-to PSTN destination, and no trunks (i.e., from trunk 77 handling the call) are in use.

```

The following portion of a filtered Wireshark trace (tracing SIP messages on the public outside interface of the SBC only) shows the same incoming PSTN call. The call vector answers the call (frame 1034), plays an announcement to the caller (note elapsed time between frames 1046 and 2039 when RTP carrying the announcement is flowing to Verizon). The vector then uses a “route-to” step to cause a REFER message to be sent (highlighted and expanded frame 2039) with a Refer-To header containing the number configured in the “route-to” step. In frame 2053, Verizon sends a 202 Accepted message for the REFER.

Filter: sip && ip.addr == 172.30.205.55		Expression... Clear Apply			
No. -	Time	Source	Destination	Protocol	Info
889	63.197800	172.30.205.55	1.1.1.2	SIP/SDP	Request: INVITE sip:8668523221@advc.avaya.globalipcom
890	63.199354	1.1.1.2	172.30.205.55	SIP	Status: 100 Trying
892	63.213319	1.1.1.2	172.30.205.55	SIP/SDP	Status: 183 Session Progress, with session description

2053	74.009945	172.30.205.55	1.1.1.2	SIP	Status: 202 Accepted

Verizon then sends a re-INVITE (highlighted frame 2056, with SDP c=0.0.0.0). The 200 OK (frame 2063) and ACK (frame 2065) to this Verizon re-INVITE then occur. In frame 2066, Verizon sends a NOTIFY message, with sipfrag “100 Trying”. When the call is answered by the Refer-To target, in frame 2171, Verizon sends a NOTIFY message, with sipfrag “200 OK”. In frame 2172, the enterprise sends the 200 OK for the NOTIFY, and a BYE is sent for the call.

No. -	Time	Source	Destination	Protocol	Info

2173	82.087498	1.1.1.2	172.30.205.55	SIP	Request: BYE sip:+17322909267@172.30.205.55:5072
2174	82.202623	172.30.205.55	1.1.1.2	SIP	Status: 200 OK

In sum, although the PSTN caller who dialed the IP Toll Free number is talking to the Referred-to destination, no trunks are in use to the enterprise site that initially received the call.

9.2.3 Example Incoming Call Referred with UII to Alternate SIP Destination

The following Communication Manager “list trace vector” trace output shows a different example incoming Verizon toll-free call. The call was routed to a Communication Manager vector directory number (VDN 3690) associated with a call vector (call vector 5). As in previous illustrations, this vector will answer the call, play an announcement to the caller, and then use a “route-to” step to cause a REFER message to be sent to Verizon. In this case, the Refer-To number will cause Verizon to route the call to another SIP-connected destination. In the sample configuration, where only one site is available, this was tested by including a different IP Toll Free number (866-851-2649) assigned to the same site in the Route-To step in the vector. The vector also sets UII data that will be included in the Refer-To header. When Verizon originates a new call to the “alternate” destination, the INVITE message sent by Verizon will contain a User-To-User header containing the UII data originally sent by the referring site in the Refer-To header. In practice, this would allow a Communication Manager at one site to pass call or customer-related data to another site via the Verizon network.

```

The following beginning of a filtered Wireshark trace (tracing SIP messages on the public outside interface of the SBC only) shows another call to a Verizon toll-free number. At the start, the trace looks very similar to the one shown in the previous section. The user dials the number 8668506850. Session Manager has adapted the number to Communication Manager vector directory number 3690 associated with vector 5. The vector answers the call (frame 493), plays an announcement to the caller (note elapsed time between frames 502 and 1481), and then uses a “route-to” step to cause a REFER message to be sent (highlighted frame 1481). The REFER includes a Refer-To header containing the number configured in the “route-to” step, which in this case contains another IP Toll Free number (+1866-851-2649). Note that the Refer-To header in the REFER also contains the UII data set in vector 5.

Refer-To: <sip:+18668512649@172.30.205.55:5072?User-to-User=043132333435363738393031323334353637383930313233343536373839303132%3Bencoding%3Dhex>. In frame 1495, Verizon sends a 202 Accepted message for the REFER.

 Refer-To: <sip:+18668512649@172.30.205.55:5072?User-to-User=043132333435363738393031323334353637383930313233343536373839303132%3Bencoding%3Dhex>

In frame 1514, Verizon sends the re-INVITE with SDP c=0.0.0.0 for the initial call, which begets the 100 Trying (frame 1516), 200 OK (frame 1518), and ACK (frame 1523). Verizon then routes the call to the number specified in the Refer-To header which in this case is another Verizon toll-free number assigned to this same site (i.e., in production, this would typically be used to route to an alternate site). Frame 1525 is selected below to show the INVITE from Verizon that was stimulated by the REFER/Refer-To with UII. From the highlighted message summary, it can be observed that the R-URI contains 866-851-2649, the toll-free number used in the Route-to step in the vector. In the center, where details of the contents of the INVITE are shown, note that the PAI contains the original caller ID of the true PSTN caller (+1-732-687-0755), and the User-to-User header contains the contents of the UII previously sent by the Avaya CPE to Verizon in the Refer-To header in the REFER message. The reader may also observe that this INVITE from Verizon does not contain SDP.

Scrolling down further in this same trace, the call to 866-851-2649 is routed to VDN 3660 associated with vector 60 which queues the call to split 60. In this case, a one-X® Agent is available to take the call immediately. In frame 1565, the enterprise site sends the 200 OK with SDP when the new inbound call to 866-851-2649 is answered. Verizon responds with an ACK with SDP in frame 1569 (recall that the initial INVITE from Verizon did not contain SDP). Once the referred-to destination has answered, Verizon sends the NOTIFY containing the “200 OK” result in frame 1571, which is highlighted and expanded. Since the call was answered by a one-X® Agent capable of direct media, Communication Manager begins the “shuffling to ip-direct” which results in the re-INVITE sent to Verizon in frame 1576. Communication Manager sends a BYE for the original call in frame 3577. The “shuffling to ip-direct” for the call with the agent concludes with the ACK in frame 1608.

The PSTN caller and the answering party of the referred-to call are now talking. If the answering party of the referred-to call is a Communication Manager user who has a “uui-info” button, and the answering user’s Class of Restriction (COR) allows “Station Button Display of UI IE data”, the answering user can see the UI data on the display phone by pressing the “uui-info” button. In a multi-site contact center setting, a contact center agent answering a call at site B could see the UI sent in the REFER from site A.

A one-X® Agent was logged in as extension 2014 as shown by the abridged “list registered” screen from Communication Manager shown below.

list registered-ip-stations				
REGISTERED IP STATIONS				
Station Ext or Orig Port	Set Type/ Net Rgn	Prod ID/ Release	TCP Skt	Station IP Address/ Gatekeeper IP Address
2014	9630	IP Agent	y	10.10.103.100
	5	9.0		10.80.140.146

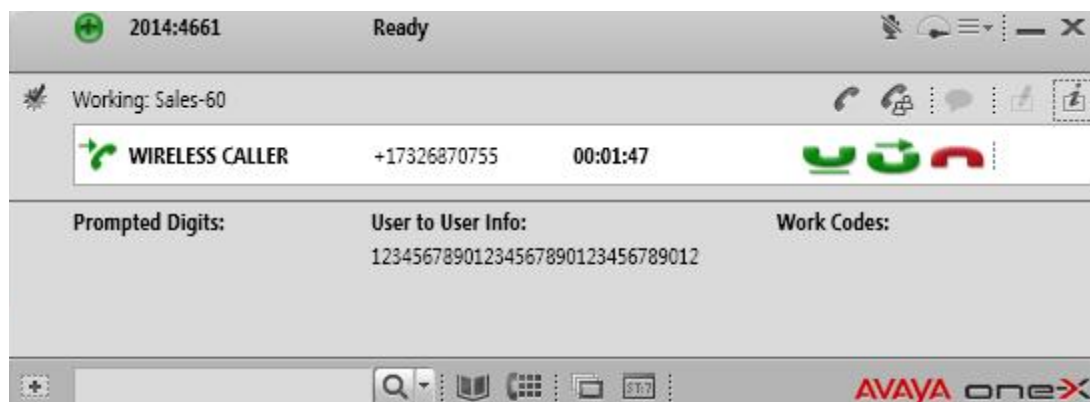

A one-X® Agent was logged in as agent-login-ID 4661 as shown by the abridged “list agent” screen from Communication Manager shown below.

list agent-loginID									
AGENT LOGINID									
Login ID	Name	Extension	Dir Agt	AAS/AUD	COR Ag	Pr	SO		
	Skil/Lv	Skil/Lv	Skil/Lv	Skil/Lv	Skil/Lv	Skil/Lv	Skil/Lv	Skil/Lv	
4660	EAS-Agent1	unstaffed					1	lv1	
	60/01	/	/	/	/	/	/	/	
4661	EAS-Agent2	2014					1	lv1	
	60/01	/	/	/	/	/	/	/	

The following screen capture shows the call at the one-X® Agent. The caller was a mobile phone with caller ID +17326870755.

If the “WorkItem Details”  icon at the far right side of the GUI is clicked while on the call, the User to User Info (UI) is revealed. In this simple case, the UII was the data set in the vector from which the call was referred back to Verizon. Recall that Verizon extracted this UII from the REFER and sent it within the INVITE to the Refer-To target of the call. Communication Manager then made the UII available to the answering agent as evidenced below.

In alternate call scenarios, if no agent is immediately available to take the call, a 182 Queued message would also be observed. In the sample configuration, the caller would hear a recurring announcement after a 200 OK is sent to Verizon when the announcement answers the call. Once Verizon receives the 200 OK answering the call sent to the Refer-To target, Verizon will send a NOTIFY with sipfrag 200 OK to the original referred call, causing Communication Manager to send a BYE for the original referred call. That is, based on the NOTIFY/200 OK from Verizon, Communication Manager will clear the original call either upon answer by the announcement when the call enters queue, or answer by the actual agent if the call never needed to be queued. Without further elaboration, the following screen is an example of a call that was queued hearing an announcement before ultimately being answered by an agent when an agent became available.

9.3. System Manager and Session Manager Verifications

This section contains verification steps that may be performed using System Manager for Session Manager.

9.3.1 Verify SIP Entity Link Status

Log in to System Manager. Expand **Elements** → **Session Manager** → **System Status** → **SIP Entity Monitoring**, as shown below.

▼ Session Manager
Dashboard
Session Manager Administration
Communication Profile Editor
▶ Network Configuration
▶ Device and Location Configuration
▶ Application Configuration
▼ System Status
SIP Entity Monitoring
Managed Bandwidth Usage
Security Module Status
Registration Summary
User Registrations
▶ System Tools
▶ Performance

From the list of monitored entities, select an entity of interest, such as “Avaya-SBCE-2”, corresponding to the entity link to the inside or private interface of the Avaya SBC. Under normal operating conditions, the **Link Status** should be “Up” as shown in the example screen below.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

All Entity Links to SIP Entity: Avaya-SBCE-2

Summary View

1 Item Refresh	Filter: Enable						
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
► Show	ASM-62	10.80.140.200	5060	TCP	Up	200 OK	Up

If “Show” in the Details column is selected, additional information can be observed. In the screen below, note that the “Last Response Latency” was 130 msec for the last OPTIONS 200 OK response. Recall that the Avaya SBCE sends the OPTIONS received from Session Manager to Verizon. Verizon sends the 200 OK to the SBC, and the SBC sends the 200 OK to Session Manager, accounting for the greater latency compared with OPTIONS sent to other local entities.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

All Entity Links to SIP Entity: Avaya-SBCE-2

Summary View

1 Item Refresh	Filter: Enable						
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
▼ Hide	ASM-62	10.80.140.200	5060	TCP	Up	200 OK	Up
Time Last Down	Time Last Up	Last Message Sent	Last Message Response	Last Response Latency (ms)			
Jan 26, 2012 8:24:52 AM MST	Jan 26, 2012 9:39:59 AM MST	Jan 30, 2012 3:27:48 PM MST		130			

Return to the list of monitored entities, and select another entity of interest, such as “CM-Evolution-procr-5063”. Under normal operating conditions, the **Link Status** should be “Up” as shown in the example screen below. Note the use of port 5063.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

All Entity Links to SIP Entity: CM-Evolution-procr-5063

Summary View

1 Item Refresh	Filter: Enable						
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
► Show	ASM-62	10.80.140.146	5063	TCP	Up	200 OK	Up

In the following screen, “Show” under Details was selected to view additional information. Note the Last Response Latency is only 9 msec in this case, owing to the fact that Communication Manager responds to the OPTIONS without proxying the OPTIONS to a next hop, as did the Avaya SBCE to Verizon.

SIP Entity, Entity Link Connection Status

This page displays detailed connection status for all entity links from all Session Manager instances to a single SIP entity.

All Entity Links to SIP Entity: CM-Evolution-procr-5063

Summary View

1 Item Refresh		Filter: Enable					
Details	Session Manager Name	SIP Entity Resolved IP	Port	Proto.	Conn. Status	Reason Code	Link Status
▼ Hide	ASM-62	10.80.140.146	5063	TCP	Up	200 OK	Up
Time Last Down	Time Last Up	Last Message Sent		Last Message Response		Last Response Latency (ms)	
Never	Jan 26, 2012 11:06:02 AM MST	Jan 30, 2012 3:22:20 PM MST				9	

9.3.2 Call Routing Test

The Call Routing Test verifies the routing for a particular source and destination. To run the routing test, expand **Elements** → **Session Manager** → **System Tools** → **Call Routing Test**, as shown below.

▼ Session Manager
Dashboard
Session Manager Administration
Communication Profile Editor
▶ Network Configuration
▶ Device and Location Configuration
▶ Application Configuration
▶ System Status
▼ System Tools
Maintenance Tests
SIP Tracer Configuration
SIP Trace Viewer
Call Routing Test
▶ Performance

A screen such as the following is displayed.

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

SIP INVITE Parameters

Called Party URI <input type="text"/>	Calling Party Address <input type="text"/>
Calling Party URI <input type="text"/>	Session Manager Listen Port <input type="text" value="5060"/>
Day Of Week <input type="text" value="Monday"/>	Time (UTC) <input type="text" value="16:59"/>
Called Session Manager Instance <input type="text" value="SM1"/>	Transport Protocol <input type="text" value="TCP"/>
<input type="button" value="Execute Test"/>	

Populate the fields for the call parameters of interest and click **Execute Test**.

For example, the following shows a call routing test for an inbound toll-free call from the PSTN to the enterprise via the Avaya SBCE (10.80.140.200). Under **Routing Decisions**, observe that the call will route to the Communication Manager using the SIP entity named “CM-Evolution-procr-5063”. The digits are manipulated such that the Verizon toll-free number (i.e., 866-850-6850) is converted to a Communication Manager extension (i.e., VDN 3690) by the adapter assigned to the Communication Manager entity. Scroll down to inspect the details of the **Routing Decision Process** if desired (not shown).

The Session Manager Listen Port needed to be set to a port other than 5060 for this call routing test to produce the result shown below, but in fact the SBC and Session Manager communicate using port 5060. In Session Manager 6.0, this field could be set to 5060, the port from which the INVITE arrives. See **Section 2.2**.

Home / Elements / Session Manager / System Tools / Call Routing Test

[Help](#) :

Call Routing Test

This page allows you to test SIP routing algorithms on Session Manager instances. Enter information about a SIP INVITE to learn how it will be routed based on current administration.

SIP INVITE Parameters

Called Party URI <input type="text" value="8668506850@avayalab.com"/>	Calling Party Address <input type="text" value="10.80.140.200"/>
Calling Party URI <input type="text" value="anycaller@anydomain.com"/>	Session Manager Listen Port <input type="text" value="5063"/>
Day Of Week <input type="text" value="Wednesday"/>	Time (UTC) <input type="text" value="18:37"/>
Called Session Manager Instance <input type="text" value="ASM-62"/>	Transport Protocol <input type="text" value="TCP"/>
<input type="button" value="Execute Test"/>	

Routing Decisions

Route < sip:3690@avayalab.com > to SIP Entity CM-Evolution-procr-5063 (10.80.140.146). Terminating Location is null.

10. Conclusion

As illustrated in these Application Notes, Avaya Aura® Communication Manager 6.2, Avaya Aura® Session Manager 6.2, and Avaya Session Border Controller for Enterprise can be configured to interoperate successfully with Verizon Business IP Contact Center Services IP Toll Free VoIP Inbound service. This solution enables inbound toll free calls over a Verizon Business VoIP Inbound SIP trunk service connection. In addition, these Application Notes further demonstrate that the Avaya Aura® Communication Manager implementation of SIP Network Call Redirection (SIP-NCR) can work in conjunction with Verizon Business IP Contact Center services implementation of SIP-NCR to support call redirection over SIP trunks inclusive of passing User-User Information (UUI).

Please note that the sample configurations shown in these Application Notes are intended to provide configuration guidance to supplement other Avaya product documentation.

The configuration and software versions described in these Application Notes have not yet been independently certified by Verizon labs. These Application Notes can be used to facilitate customer engagements via the Verizon field trial process, pending Verizon labs independent certification.
