Abstract

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) trunking between the McLeodUSA SIP Trunking solution and an Avaya IP Office telephony solution. The Avaya solution consists of Avaya IP Office, and Avaya H.323, digital and analog endpoints.

McLeodUSA is a domestic service provider offering affordable, flexible and reliable integrated voice and data services to small and medium-sized business in nearly 500 cities throughout the Midwest, Rocky Mountain, Southwest and Northwest regions.

McLeodUSA is a member of the Avaya Developer Connection Service Provider program. Information in these Application Notes has been obtained through Developer Connection compliance testing and additional technical discussions. Testing was conducted via the Developer Connection Program at the Avaya Solution and Interoperability Test Lab.
1. Introduction

These Application Notes describe the steps to configure Session Initiation Protocol (SIP) trunking between the McLeodUSA SIP Trunking service and an Avaya IP Office telephony solution. The Avaya solution consists of Avaya IP Office, and Avaya H.323, digital and analog endpoints.

McLeodUSA is a domestic service provider offering affordable, flexible and reliable integrated voice and data services to small and medium-sized business in nearly 500 cities throughout the Midwest, Rocky Mountain, Southwest and Northwest regions.

SIP Trunking from McLeodUSA combines local and long-distance voice service, secure data networking and broadband Internet access on one performance-guaranteed connection.

Customers using this Avaya IP Office telephony solution with McLeodUSA SIP Trunking solution are able to place and receive PSTN calls via a dedicated broadband Internet connection using the SIP protocol. This converged network solution is an alternative to more traditional PSTN trunks such as T1 or ISDN PRI.

McLeodUSA can connect directly to an IP phone system as well as an external router. Customers looking for a turnkey access solution can select a Managed Service option, where McLeodUSA provides and manages the router that interfaces with customer equipment. McLeodUSA’s SIP Trunking solution offers the following capabilities:

- Outbound domestic calling to local and long distance services
- Outbound international calling
- Incoming Direct Inward Dial (DID) service
- Dynamically reroute inbound calls from one location to another location on the McLeodUSA MPLS network, without long distance charges
- Call restriction, by area code, by number, or by call type

Figure 1 illustrates a sample Avaya IP telephony solution connected to McLeodUSA’s SIP Trunking solution. This configuration was utilized for compliance testing.

The following equipment comprised the Avaya IP telephony solution and simulated a customer site:

- Avaya IP Office 406v2
- Avaya 4610SW IP Telephone (H.323 protocol).
- Avaya 6424D+M Digital Telephone
- Avaya 6210 Analog Telephone
2. Equipment and Software Validated

The following equipment and software were used for the sample configuration provided:

<table>
<thead>
<tr>
<th>Avaya IP Telephony Solution Components</th>
<th>McLeodUSA SIP Trunking Solution Components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avaya IP Office 406v2 R 4.0.7</td>
<td>McLeodUSA Application Server R14</td>
</tr>
<tr>
<td>Avaya IP Office Manager (Windows PC) R 6.0 (07)</td>
<td>McLeodUSA Network Server R14</td>
</tr>
<tr>
<td>Avaya 4610SW IP Telephone R2.8 – H.323 – a10d01b2_8.bin</td>
<td>McLeodUSA Media Server R14</td>
</tr>
<tr>
<td>Avaya 6424D+M Digital Telephone n/a</td>
<td>McLeodUSA PSTN Gateway (LCS) v3.10.1.7.xp19</td>
</tr>
<tr>
<td>Avaya 6210 Analog Telephone n/a</td>
<td>McLeodUSA SBC (VF3000) v6.0.4.079</td>
</tr>
</tbody>
</table>

Table 1: Equipment and Software Tested

This solution is compatible with all other Avaya IP Office platforms running IP Office software release 4.0.7.
3. Configure Avaya IP Office

This section describes the steps for configuring a SIP trunk on IP Office.

IP Office is configured via the IP Office Manager program. Log into the IP Office Manager PC and select Start → Programs → IP Office → Manager to launch the Manager application. Log into the Manager application using the appropriate credentials.

1. Verify that there is a SIP Trunk Channels License. Double-click on Licence in the left panel. Check that there is a SIP Trunk Channels entry.

If a required feature is not enabled or there is insufficient capacity, contact an authorized Avaya sales representative to make the appropriate changes.
2. **Enable SIP Proxy Functionality.** Select **System** in the left panel. In the **LAN1** tab, select the **Gatekeeper tab**, and check the **SIP Proxy Enable** box.
3. **Configure DiffServ Settings according to McLeodUSA requirements.** Select **System** in the left panel. In the **LAN1** tab, select the **Gatekeeper** tab. Under **DiffServ Settings**, enter **EF** into the **DSCP(Hex)** and **SIG DSCP(Hex)** text boxes. This allows the voice and signaling packets to get the highest priority in McLeodUSA’s network.
4. **Create the SIP line for the McLeodUSA service.** Select **Line** in the left panel. Right-click and select **New → SIP Line**.

Select the following:
- For the **ITSP Domain Name field**, enter the McLeodUSA Domain Name. SIP registration messages will use this name (Please refer to the Installation Package provided by McLeodUSA for actual settings.)
- For the **ITSP IP Address field**, enter the IP address of the McLeodUSA SIP Proxy
- For **Registration Required**, check the box to enable
- For **Primary Authentication Name**, use the Trunk ID assigned by McLeodUSA
- For **Primary Authentication Password**, use the password assigned by McLeodUSA
- For **Compression Mode**, select the **G729a 8K CS-ACELP** for all voice calls. (To ensure proper interoperability between Avaya IP Office and McLeodUSA for voice calls, G.729a is required. G.711 MU law is reserved for Fax calls only.)
- For **Layer 4 Protocol**, use **UDP**
- For **Send Port**, use **5060**
- For **Listen Port** use **5060**
- For **Line Network Topology Info** use **LAN 1**
- Use defaults for other fields
5. **Configure URI parameters for the line.** Select the **SIP URI** Tab. Press the **Add** button.

Enter a unique number for the **Incoming Group** and **Outgoing Group** fields. Select **Use User Data** for the **Contact**, **Local URI** and **Display Name** fields, this tells the system to use the information configured on the SIP tab for each individual user (see **Step 9**). Use defaults for all other fields. Press the **OK** button.
6. **Configure SIP OPTIONS timer on Network Topology Tab for “keep alive” function with McLeodUSA.** Select **System** in the left panel. In the **LAN1** tab, select the **Network Topology** tab.

Set the **Binding Refresh Time** to the desired interval which determines the frequency with which OPTIONS messages will be sent to McLeodUSA’s SIP proxy. For **Public IP Address**, enter the Avaya IP Office system IP address. Confirm that **Public Port** is set to 5060 and take defaults for all other fields.
7. Configure a short code to route calls to McLeodUSA’s SIP Proxy Server. Select Short Code in the left panel. Right click and select Add. Enter \([x]N;\), where \(x\) is a valid number, in the Code text box. The number 7 is used for \(x\) in the below example. This code requires the user to dial the digit 7 followed by the destination’s telephone number symbolized by \(N\) in order to route the call out the SIP Trunk.

Note: \(N\) can be any number other than a local IP Office extension. For example, a 10-digit Direct Inward Dial (DID) number, operator assistance, 411, information service etc.

Select Dial for the Feature. Enter the Outgoing Group Id created in Step 5 for the Line Group Id field. Enter the dialed number \(N\) followed by “@<Domain Name of McLeodUSA >” for the Telephone Number field. The Telephone Number field is used to construct the To field’s SIP URI in the outgoing SIP INVITE message (see Appendix A for examples of SIP INVITE messages). Use default values for all other fields. Press the OK button.
8. Create an Incoming Call Route for the Inbound SIP calls. Select **Incoming Call Route** in the left panel. Right-click and select **New**.

Enter the following:
- **Any Voice** for the **Bearer Capability** field.
- The Incoming Group created for the URI in **Step 5** in the **Line Group Id** field.
- The 10 digit DID provided by McLeodUSA, that is mapped back to a local IP Office extension, in the **Incoming Number** field.
- In the **Destination** field, select the desired local extension number from the drop down menu.
- Use default values for all other fields. Press the **OK** button.
9. **Configure Users’ SIP names.** Select **User** in the left panel. Select the desired user by double-clicking on an entry in the right panel. Select the **SIP** tab all the way at the end.

Modify the **SIP Name**, **SIP Display Name (Alias)** and **Contact** fields to the DID number provided by McLeodUSA that is used for this particular extension. These settings instruct the system to use this DID to construct the:

- user part of the SIP URI in the From header of an outgoing SIP INVITE message
- user part of the SIP URI in the Contact header of an outgoing SIP INVITE message

(see Appendix A for examples of SIP INVITE messages.)

The other fields can be left as defaults. Press the **OK** button.

10. Repeat **Steps 8** and **9** for all users that will be sending/receiving SIP calls on the system.
4. McLeodUSA Services Configuration
The McLeodUSA SIP Trunking solution offers the growing number of business customers with IP-based phone systems, many different configurations that can be scaled based on specific voice, data and configuration needs.

Customers can choose to terminate service directly to their IP phone system, to an external router provided by the customer, or to an Integrated Access Device (IAD) with the standard and premium options provided by McLeodUSA. If the customer requires an Ethernet hand-off to their equipment, the McLeodUSA standard or premium equipment option is required.

The standard product solution is available in bandwidths ranging from 1.5 Mbps up to 12.0 Mbps in single DS1 increments. Solutions with McLeodUSA-provided equipment are limited to 6.0 Mbps. Each solution includes a minimum of 6 simultaneous call paths, with the ability to scale to the customer’s specific business need in increments of 6 call paths. The standard configuration includes 30 call paths for each 1.5 Mbps of bandwidth, although up to 48 call paths for each 1.5 Mbps of bandwidth can be accommodated if “non-voice” bandwidth is not required.

For customers selecting the standard or premium equipment option, McLeodUSA also includes access to 3 FXS ports (per 1.5MB) on the IAD for customer use, typically for analog device support. Customers must identify all numbers that are associated with analog devices so that voice compression is disabled.

All telephone numbers associated with the McLeodUSA SIP Trunking solution must be in a McLeodUSA-served rate center within approximately 1,000 central offices in a 20-state footprint. This includes numbers that will be ported to the service or numbers requested as new in conjunction with the installation of service. Specific availability is available at www.mcleodusa.com

The product solution is sold by McLeodUSA field sales executives and by other Direct and Indirect Sales channels such as Master Agents, their sub Agents, Lead Agents and through Referral Agents. Companies interested in becoming a McLeodUSA Business Partner may visit www.mcleodusa.com/IndirectSales.do for more information.

5. Interoperability Compliance Testing
This section describes the interoperability compliance testing used to verify SIP trunking interoperability between McLeodUSA Service and an Avaya IP OfficeTelephony Solution. This section covers the general test approach and the test results.
5.1. General Test Approach
A simulated enterprise site consisting of an Avaya IP Office telephony solution supporting SIP trunking was connected to the public Internet using a dedicated broadband connection. The enterprise site was configured to use the commercially available SIP Trunking solution provided by McLeodUSA. This allowed the enterprise site to use SIP trunking for calls to the PSTN.

The following features and functionality were covered during the SIP trunking interoperability compliance test:

- Incoming calls to the enterprise site from the PSTN were routed to the DID numbers assigned by McLeodUSA.
- Outgoing calls from the enterprise site were completed via McLeodUSA to the PSTN destinations.
- Calls using H.323, digital and analog endpoints supported by the Avaya IP Office telephony solution.
- Various call types including: local, long distance, international, and directory assistance calls.
- Calls using G.729a codec types.
- Fax routing to ensure G.711mu use for fax calls.
- DTMF tone transmission using RFC 2833 with successful voice mail navigation with G.729a
- Telephone features such as hold, transfer, conference.

6.2. Test Results
Interoperability testing of the sample configuration was completed with successful results.

The following observations were noted.

- For the Current Release, Only the G729a Codec should be used if DTMF tones are required. As stated in Step 4, G.729a should be used for all voice calls. This includes calls that require the use of DTMF tones.
- The Full SIP URI is displayed on incoming calls. When an inbound call is placed into IP Office, the full SIP URI is seen on the telephone’s call display instead of just the calling party number.
7. Verification Steps
This section provides verification steps that may be performed to verify that the H.323, digital and analog endpoints can place outbound and receive inbound calls through McLeodUSA’s service.

1. Verify that endpoints at the enterprise site can place calls to the PSTN and that the call remains active for more than 35 seconds. This time period is included to verify that proper routing of the SIP messaging has satisfied SIP protocol timers.

2. Verify that endpoints at the enterprise site can receive calls from the PSTN and that the call can remain active for more than 35 seconds.

3. Verify that the user on the PSTN can terminate an active call by hanging up.

4. Verify that an endpoint at the enterprise site can terminate an active call by hanging up.

8. Support
For technical questions regarding a customer installation, please call the McLeodUSA toll-free number provided in the customer information packet. For general, non-technical questions, please contact McLeodUSA Customer Care at 1-800-593-1177.

9. Conclusion
These Application Notes describe the configuration steps required to connect customers using an Avaya IP Office telephony solution to McLeodUSA’s service. McLeodUSA offers a flexible VoIP solution for customers with a SIP based network. SIP trunks use the Session Initiation Protocol to connect private company networks to the public telephone network via converged IP access, providing an alternative to traditional hardwired telephony trunk lines.
